We would gladly escape the duty of comment upon these appalling facts. We learn of this outburst of the worst type of hoodlumism in the interior of the State with the most profound sorrow. We had no idea the evil was so wide-reaching. It may be clearly shown that these boys had no intent to endanger life or to destroy it. It may be that they thought, if they thought at all, that the Chinaman they killed would save himself as the others they had attacked escaped. And yet when one thinks of the state of mind in boys which would lead them to such sport, and of the deplorable results if a taste for such sport should become general among our youth, the occasion for remark upon the occurrence cannot be set aside. If such are the boys of California, what will be the coming men of California.

This is the question that every parent, every teacher and everyone who in any way exerts a molding influence upon the thoughts and conduct of our youth must squarely and resolutely face. If the facts described above do not enforce the lesson, it is hard to conceive any event capable of enforcing it. Here are four boys who have certainly been exposed to some good influences, indulging in a sport, in actions thoroughly had in conception and murderous in execution. Where rests the blame?

Perhaps a share of it may be charged to a class sentiment more or less prevalent, that a Chinaman is the ordained victim of any persecution. Let this brutal sentiment bear all the blame which can be placed upon it. It is a disgrace to manhood, a triumph of cowardice, an outrage to every sense of fairness. It is inhuman, base and altogether abominable. Would that all the blame could be placed upon it for it is bad enough to father any crime. But can we charge a more or less prevalent sentiment with the corruption of our youth and idly wring our hands in contemplation of impending evil?

A public sentiment is the product of individual minds. We are prone to lose sight of our responsibility when we think of its existence or its influence. And yet the responsibility remains, and it is well to face it. The depravity of these Stockton boys is directly chargeable to their parents, and is doubtless the result of their home training or the lack of it. The Chinaman in the case is but a small part of it. Even if these parents cherish strong feelings against the encroachment of Chinamen upon the labor fields of the State, this is no excuse for persecution or for the encouragement of cruel thoughts in their children. No child whose mind had been properly trained to thoughts of gentleness and nobility would treat a dog as these boys treated a human being. It is plain that youth who early find sport in the persecution of any of God's creatures, will later in life develop into heartless men, reckless of everything, unless the early propensity is rebuked and suppressed. For this reason it behooves every parent to guard well the children entrusted to his care. The future of the children themselves demands it. The future of the State is imperiled by the growth of a cruel, cowardly sentiment in its citizenship. The old age of the parent will be no peaceful period if he allow the seeds of discord to find rooting in his children's minds. All considerations call for the full and conscientious discharge of parental duties, and the event at Stockton should most forcibly impress this fact upon all minds.

The Stockton *Herald* states that at least three of the boys were Sunday school scholars. This is the greater shame. It does not argue against Sunday school training, although it should incite teachers to exercise greater skill and care in the inculcation of the spirit of nobility and gentleness which is embodied in the gospels which they expound. It shows that the Sunday school teacher must endeavor to gain a closer acquaintance with the thoughts and desires of the youth they gather around them, and aim to repress the thoughts which neglect at home give opportunity for growth. We trust the unfortunate occurrence at Stockton will open the eyes of all to the danger which threatens, and lead all to renewed and more earnest efforts to guard against it.

MUCH excitement exists in the northern portion of Napa county over recent extensive discoveries of chrome iron. Large numbers of people are continually out prospecting and locating claims wherever they find indications.

Cable Railroads.

The following paragraphs on the above subject are from the address of W. W. Morrow, at the opening of the Mechanics' Industrial fair:

In this city, under our very eyes, we have seen a revolution created in the system of street railroads, and, while to the public of San Francisco the transition has been gradual and familiar, the invention is of such a character as to deserve here special mention, because the inventor was for many years the President of this noble and enterprising society, and the invention itself is another example of what Californians are doing for the world.

For many years, horse flesh has been the principal motive power used in carrying people to and fro in cities and towns. And as the democratic omnibus succeeded the more aristocratic cab, it in time became supplanted by the less noisy, more convenient and less costly street car; but they all had to be drawn by horses, and as these modes of conveyance multiplied, as they naturally did from their convenient and cheap mode of transit, more horses were used, and a larger number killed by overwork, especially on streets where the ascent was steep, or where the number of passengers carried was very great.

Steam motors, compressed air, latent steam, and other plans had been tried without success, and methods that could be operated on country roads were not permitted to be used in cities and towns.

Large corporations were formed for carrying on street railroad traffic, and possessing thousands of horses, immense stables for their care and maintenance were required.

In such cities as Philadelphia, where streets are almost level and laid out at right angles, the city railroad companies have a car line on every street, and make large profits on their passengers at the rate of fare charged.

But in many cities, like San Francisco, where the streets run up and over steep hills, the service to the public was poor, the remuneration to the company was not great, while the comfort and care of the poor horses was certainly as bad as it could be.

The highest hills in the city were uninviting, except to the enthusiastic climber who had just arrived and wanted to get a bird's-eye view of the State.

At the north end of the city the cars of the Omnibus Railroad Co. were drawn up Jackson street from Kearny to Stockton, a distance of 875 ft., by 5 horses, the elevation in that distance being 73 ft.

In the winter evenings, when the cars were crowded, the struggle of those unfortunate horses up that steep hill was something terrible.

It was on such an occasion in the winter of 1869 that A. S. Hallidie was watching the efforts of the horses to draw up an overcrowded car, when one of the animals slipped on the wet cobbles and fell, throwing down the horse behind him. The brakes were immediately put on and the horses urged to regain their footing; but the brakes being insufficient to hold the car on the steep incline, it slid backward, dragging the horses down the hill to the crossing below.

To this incident we are indebted for the cable road of to-day, and all its attendant comforts.

Within two years Mr. Hallidie had matured his plans for a road, but, like all such inventions and enterprises, it did not at first meet with much encouragement, and but for the assistance and co-operation of two or three gentlemen, who saw in it more than the mere fancy of an inventive mind, it would have slumbered where it was born.

In September, 1873, the first railroad of the kind ever built was constructed on Clay street in this city, and, while a great many difficulties and obstacles had been overcome, and notwithstanding it surprised the majority of the people by the simplicity of its working, it yet failed for some time to convince the skeptical of its ultimate success, but as it continued to run month after month under the care and guidance of its master, it gradually won the confidence and admiration of the entire public.

The simple principles involved and their ingenious adaptation mark the value of the invention and the success of the undertaking.

And what a revolution it has made in the mode of transporting passengers in this city!

The hills have fallen down before it, and they are now even more accessible and certainly far more desirable for residence than the level portions of the city.

Where the goats used to frolic on California street hill mighty railroad kings have built their palaces. The bald old hill has taken on all the bewitching charms of a young girl with a bright, new poke bonnet, while Clay street and Russian hills, decked out in their new finery, flirt with those brown old hills across the Gate in Marin county.

The summit of Clay street hill, reached by the cable road, is 307 ft. above the starting point at Kearny street, and the time required to make the transit is six minutes by cars that depart every five minutes, ascending the steep incline as noiselessly and as lightly as a bird in flight. The feelings of personal discomfort for the tired and straining horses are entirely absent, and the weary passenger returning home, enjoys a rest of body and soul.

Property on these hills which, before the advent of these roads, could be purchased for almost any price, now commands high figures and is being rapidly built upon and improved.

It is eight years ago yesterday since the first experimental trip was made on the Clay street road, which at that time was 2,880 ft. long.

Since then the road has been extended to double that length. Four other roads have been built, and another is now in course of construction. On the five roads now in operation steam machinery is employed of the aggregate of 1,300 horse-power, keeping in motion for 18 hours each day 17 miles of steel wire rope, containing 2,350 miles of wire and transporting 40,000 passengers daily.

Under the old system one horse would draw, on a nearly level road, an average of 40 passengers daily; but 10,000 horses could not perform the work of our present cable roads. Another item is the expense. On the Clay street cable road 36 lbs. of coal will draw 40 passengers; or in other words 9-10 of a pound of coal, costing 3-10 of one cent, represents the cost of fuel in drawing one passenger.

While the underground railroad is the peculiar feature of London, and the elevated railroad is in like manner the feature of New York, San Francisco takes special pride in her cable roads, in which there has already been invested a capital of one and one-fourth millions of dollars.

The enterprising city of Chicago, that never does things by halves, is building a series of cable roads which will cost over $2,000,000.

Thus it will appear that while the design of the inventor was more particularly to overcome the difficulties of steep grades, it will prove there, as it has here, admirably adapted to level streets, and the result will probably be that the principal cities of the Union will be compelled to adopt the system on account of its economy, noiselessness, rapidity and general comfort.

I might go on and multiply illustrations of the inventive genius of our people, but time does not permit of extending the inquiry on this occasion. Let me, however, recommend you to visit the Mechanics' pavilion, and there, among the thousands of articles exhibited, showing the latest productions of the farm, the machine shop, the factory and studio, you will find improvements and inventions both novel and curious, to excite your study and admiration.

Sulphuric Acid as a Metal Separator.

The parting process which the Lyon Mill and Mining Co. is about to put in practice is based on the principle that heated sulphuric acid 62 strong will dissolve the silver and copper from an alloy of gold containing not more than 10% of metals other than silver.

The details of the process are as follows: In the separating room a mass of 200 lbs. of alloy is placed in a large iron kettle with 150 lbs. of acid, and boiled. During the boiling process, which lasts about five hours, 200 lbs. more of acid are gradually added, and the resulting solution is run by a siphon to the lead precipitating vat on a lower floor, where the silver, as fine silver, is thrown down on copper slabs, by the greater affinity which sulphuric acid has for copper, which causes it to unite with and form sulphate of copper, leaving the silver practically pure.

The gold remaining undissolved in the kettle at this stage of the progress, is entirely lacking in the metallic luster which gives it its principal value as an ornament, and resembles a muddy sediment. If desired, it could be brightened even in its finely subdivided condition by the repeated baths in hot acids and water; but this is not necessary, as it regains its metallic luster upon being melted. It is taken from the boiling kettle, filtered and washed to remove the acid, and cast into bars.

The fine silver in the precipitating vats is washed off the copper slabs, and treated in a similar manner. The copper solution is carried to the crystalizing vats, where it forms into the blue crystals known as blue stone. In connection with this process there is an intricate system of lead pipes and reservoirs, planned by Mr. Gignoux, the chemist, for the saving of acid and metallic particles carried off mechanically.—*Lyon County Times.*

Success of the Stombs Elevator.

The Yreka Creek Mining Co. have been bothered a good deal in getting the new Stombs elevator to work successfully, but have received some new castings to obviate the difficulties, so that they will soon be able to start up the new machine, and stop work on the Cranston elevator in the old pit below, for which sufficient water cannot be obtained to work every day. The trouble with the Stombs elevator is to get air in the mouth to make suction, when a flood of water comes. The machine works splendidly until the water gets above a certain hight, and throws water and gravel 35 to 40 ft. high with the greatest ease. The new castings received from below are attachments to furnish the air required in the mouth of the elevator where the hydraulic nozzle enters, which it is thought may prove successful. The Stombs machine will do about half the work of the Cranston elevator, but will only need half the water, so that with 500 inches it can be going every day, while the Cranston machine with the giants cannot be operated daily short of 1,000 inches, which cannot be obtained from the ditch during the hot summer months. If the company could manage to run a smaller machine continually night and day, it would no doubt be better, as much time is lost by stoppage in allowing the pit to fill. Should the company realize a good clean up from the work of the Stombs elevator, they may probably enlarge the ditch to run the Cranston elevator day and night, on two of the Stombs elevators, while many think a bedrock tunnel may be built, which would certainly be the surest thing, and drain the whole creek bed in a natural way, far superior to any effort in raising water to the surface.

The latest operations with the Stombs elevator the past two days, prove the machine to be a grand success, since making the new additions, and extending the new and longer nozzle up into the hill at the end of the machine. It takes the water and gravel up about as extensively as the Cranston machine, if the same water power is used, though the machine is much smaller. The gravel can be raised to the hight of 50 ft., and the manufacturer guarantees that it will lift 48 ft. The advantage of this machine is the ease with which it can be moved, and the benefit of operating with a smaller quantity of water, as the Cranston elevator must have a great amount of water to work at all.—*Yreka Journal.*

THE Salt Lake *Tribune* claims that Utah possesses the biggest iron mines and most extensive coal deposits on the face of the earth. It is somewhat singular that Nevada lying between California and Utah and possessing largely the geological characteristics of both, does not contain a coal mine or a reliable coal indication, while coal exists in quantities in both California and Utah.

Hawthorne Items.

A correspondent of the Esmeralda *Herald* says: New mining districts are being made every few days in the vicinity of Hawthorne. Among the recent discoveries are the Ernest mine, situated eight miles west from Hawthorne and four miles northeast from the Big Indian and three-quarters of a mile south of Cat creek, and which is owned by A. C. Jenks and Wm. M. Grose. The average width of the ledge is three ft., and the assays made of the rock will average $100 to the ton. The boys are sinking an incline, are down 80 ft., and don't find any change in the character of the rock or the size of the ledge. The boys feel jubilant over their strike, and are confident that they have a bonanze in their mine.

The Bull of the Woods mine, discovered a short time ago, which is situated some six miles west from here, and owned by R. H. Morey, Norton and Crassy, is said to pay over $100 to the ton on the average. The ledge is two ft. wide, and can be traced over a half a mile, and when the company get fairly to work taking out the ore they will astonish the natives with the bullion extracted therefrom.

The Star & Banner Con. mine, situated near the head of North canyon and about 10 miles northwest from Hawthorne, is owned by M. S. Blunt, Jim Buchanan, L. McNeill and Jim Carrigan. The company have run a tunnel 110 ft., and have drifted 40 ft. on the ledge, the average width of which is 3½ ft. Six assays gave returns of $60 per ton. The company is now making arrangements for the construction of an 8-stamp mill. They expect to have the mill completed within two months, when employment will be given to a large number of men.

It is rumored that the Candelaria branch of the C. & C. railroad will be pushed forward some 12 miles immediately, and when completed the Candelaria and Belleville stage will be withdrawn from Hawthorne to connect with the cars at the end of the road for different points in the eastern portion of the State.

SUTRO TUNNEL.—In the main Sutro tunnel the south posts of the timbers near the Combination connection have been put in. A small fan has been erected at the north lateral junction, which is driven by a small compressed air engine, affording an abundant supply of pure air to the men working there. The general ventilation of the main tunnel has been greatly improved of late by putting in a partition and door at the connection of shaft No. 2, making that shaft a powerful downcast. The improvement is apparent as far west as the Combination connection. In the south lateral 101 ft. have been driven; total, 4,357. The distance of face from Yellow Jacket turning point, 717.23 ft.; distance of face from Kentuck south line, 131.89 ft.; distance of face to Crown Point south line, 567.82 ft.; distance of face to Forman shaft, 2,610.08 ft. Total progress for the month of July, 334 ft. Nature of the ground in the face, timbering; character of rock in the face, propylite. All of the week's progress required timbering except the first 27 ft. The temperatures observed have ranged from 84° at tunnel entrance to 97° at shaft No. 4 and 106° at south lateral drill hole. The daily flow of water from the mouth of the tunnel was equivalent to 4,675,830 standard gallons. The recent developments in the south header have a very encouraging aspect. The average of the face of ore cut through assays $17. The ownership of the strike is open to dispute, and can only be decided by actual survey. The character of the quartz is white and sugary, such as is found in the mines of the Comstock.

ANDERSON'S SPRINGS.—The proprietors lately arranged new croquet grounds near the hotel, having converted the old grounds into a fine carp pond. Recently, 1,000 young carp have been placed in the pond, which seems well adapted for fish-raising. A telegraph office has also been opened, bringing the hotel into general communication with the outside world. Following is a list of visitors during the week ending July 31st:

J. H. Boswell, W. H. Rookes, J. P. Fritts, Willis Bryant, Santa Rosa; L. Huelsmann, Sacramento; A. Ryan, Benicia; Dr. J. K. Laine, Mr. Brown, Sacramento; Henry Levy, S. F.; John Simpson, Sacramento; James McCormick, S. F.; Daniel Friendly, Peter Shay, A. G. Johnson, Sacramento; Andrew Ryan, Benicia; Mr. H. A. Smith, Mrs. Smith, Virginia City; Mrs. C. Kopf, Miss B. Kopf, Miss Stella Cannon, Santa Rosa; Miss L. Furuchis, Miss S. Furuchis, S. F.; Mr. H. Webber, Carp Ponds; Mr. A. Maeds, Mrs. A. Maeds, Maed's Camp; Mrs. Belle Farmer, Miss Ollis Farmer, Miss L. McCall, Middletown; Miss Caddis Stoddard, Miss Clara Stoddard, Alhambra Mills; Mr. Swartz, Carp Ponds; Mr. Renikie, Mrs. Renikis, Mr. Butler, Mrs. Butler and child, Middletown; Mr. Coates, Miss Coates, Sopers Ranch; Miss May Baldwin, Miss Loe Kemp, R. S. Symington, Mrs. M. E. Symington, Danville; Mrs. Joice, Miss Gussie Hahm, Mr. R. Tidmarsh, S. F.; Mr. Ward, Yuma City.

IT has been decided not to assess the Tombstone mines for taxation. It is held that although there are several mines now producing bullion that should be taxed, it would be impossible under the law to tax them and allow to go untaxed the many mines that are now merely in progress of development.

ALL the mills in Tuscarora district, excepting one, are running. But Tuscarora mining dividends are conspicuous by their absence, and, like angel's visits, are few and far between. Nevertheless Tuscarora is one of the best outside camps in Nevada.

The Engineer.

A Gigantic Engineering Enterprise.

From tha headwatsrs of the Mississippi and tha northwestern extremity of Lake Superior a long, narrow valloy, known as Mackcazie's valley, commences, which continues npoa nu almost dead lsvel northwestward until it reaches tbo Arctic ocean, a distance of ovor 2,000 miles. This immsase valley is flanked on the west by the Rocky mountains, while npon its Eastern side nothing bnt a low table-lsnd separates it from the watera of Hudson's bay. No part of the valley reaches an elevation exceeding 650 ft. above the soa level, nnd tbrongbout its entire length it is covered at intervals with a great nnmbor of lskes, several of which, as Slave lake, Great Bear lake and Lake Winnipog, are abont cqnal in area to Lake Erie. Tha wters from abont twa-tbirds of this area flow northward into tho Arctic. The southern portion finds a drainage in Hndson's bay. It is said to be practical to throw a dam across tho Mackoazie's valley at n point near the latitudo of Slave lake, and anather nt a point through which a drainage is effected to Hndson's bay, hy which tha waters of this immense tract of country may be so impounded as to form a continuous lake some 1,500 miles in length by 200 in width. The sonthorn end of the lake would bs separated from Lake Saperior by a slight elovntioa, which might ho easily cnt through to a short affluent of Lake Superior, and through which steam navigation might ho readily established and made continuous for 1,500 miles or more, to the northern extremity of the artificial lake, and from thence, hy locks, into the Mackenzie river and tho Arctic ocean.

In addition to the new navigable area whicb would thus be estahlisbsd, this lake, hy a connection witb tho Mississippi, which could he easily effected, would also serve ns an immsnee reservoir for rendering the upper waters of that river navigable at all seasons of the year. It wonld furtbermore contribute the surplus wnter needed for the proposed ship canal from Cairo, Ill., to Lake Erie, which has been proposed as a straight line of communication throngb the lakes and St. Lawrence river, and Straits of Belle Isle, to Europe. These enterprises, so magnificent in conception, it is claimed, could he carried out at a cost qnite insignificant in comparison to the immense industrial and commercial advantages which would result from tbeir completion.

A Tunnel Through Mount Blanc.

The French government has for some time past heen contemplating tbe construction of a great railway tunnel whicb sbould hriag Pnris and the aorthern parts of France into more direct commnnication with Italy thsn is afforded by the existing tuanel tbrough Mt. Cenis. The projects proposed include a tunnel through Mt. Blanc, and another through the Simplon or the Great St. Bernard. Tae last of the three has found very few friends, hut it appears likely tbat hotb tbe former projects will be carried ont. The projected Simplon tunnel is 60,719 ft. in length, while tbat through Mt. Blnnc is 44,292 ft.

Comparing tbese with the otber Alpine tunnels, we find that the Mt. Cenis is 40,093 ft., and tbe St. Gothard 48,952 ft. long. Tho Simplon would, therefore, be the longest of all.

Since the execution of the Mt. Cenis tunnel, the piercing of the Alps or of any other range has become simply a question of time and money. M. Chandon, in bis pamphlet, "Le Percement du Mont Blanc," underestimated the difficnlties of tbe work. But in M. Berand's *brochure*, "Mont Blanc et le Simplon consideres comme Voles intsrntionales," the estimate of the magnitude and cost of these undertakings was sufficiently correct, and he sbowed tbat France could not afford long to do witbout tbis contemplated improvement.

ENGINEERING FEAT.—Tbe difficult task of removing ths grent iron tower erected for Centennial purposes in Philsdelphia, known as Sawyer observatory, has just heen successfully accomplished. It was 160 ft. in hight, 8 ft. in diameter at the hase, and weigbed 40 tons. By means of a pair of shears, formed of two massive timbers 90 ft. long, bitted with a block and tackle, the tower was swung from the center and lowered to the earth, wbere it will be separated into sections of 25 ft. each for removal to Boston. Tbis, it will he recollected, was the manner in wbich Lieut. Corringe took down tbe famous monolith, in Egypt, preparatory to its removal to New York.

COL. GILLETTE is in Chicago, purchasing machinery for a stamp mill which will be put up at tbe Ivanhoe mine, in the Black range, New Mexico. Tbe oro from tbis mine is free-milling, and can he easily reduced by means ot an ordinary mill. Nevertheless tbe cheapesn and best quartz mills in nse are those built if San Francisco.

ROBERT SMITH & Co., says the Nevada *Transcript* of July 31st, have erected n one-stamp quartz mill on Grizzly canyon, three miles above Colnmbia Hill, and have a very good prospect for opening a paying mine there. They have a three-ft. ledge from which a crushing was made recently witb a result of $20 a ton.

Useful Information.

Spontaneous Combustion.

A. Renonard, of Rouoe, France, has lately experimented with greasy rags to ascertain the degree of their inflammiability nnder certain conditions. He took for this purpose n quantity of cotton rags, saturated them with boiled linseed oil, wrung them out and placed them, togetber with dry cottoa, in a box about eighteen inches long, eight inches wide and two feet high, in which he put n thermometer in order to watch the increase of temperature. The room in which the experiment was made was kept under a temperature of 170° F. Tho mercury soon began to risa, and showed, within one hour and a quarter, 340° F. Smoke commenced to come tbrough tbe fissures, and as soon as air was let in the flames burst out.

In another experiment, made nnder tho same temperature, cotton, saturated with crudo linseed oil, ignited within five or six bours. Rapeseed oil caused ignition after ten bours. In another room, where the temperaturo was left at 120 F., cotton, mixed with a little olive oil and put in a paper, burnt after six honrs. Castor oil required more than twenty-four bours; whale oil, only four hours; and fish oil, two hours. Spermaceti oil, free of glycerine, did not ignite at all; neither did heavy tar, coal tar, or slate oils.

The above experiments show very clearly the necessity for a scrupnlous watching of oily rags, which are often too carelessly bandled in our cotton and woolen mills. Even n collecting of the rags every nigbt before the closing of tbe mill is not a sure preventive against the danger of fire. There sbonld he in every department of the mill where rags are used for cleaning machinery, an iron box, which can he closed very tigbt, and every hour or two a man sbould go around, collect tbe rags aad place them in tbis box, from which they can he taken every night and disposed of in some safe manner. Too much care cannot bo taken with these snbstances, and it is hsttsr to look out in time than after the accident has happened.—*Textile Colorist.*

MOTH PREVENTIVE.—A correspondent of the *Furniture Gazette* recommends the following remedy for exterminating moths in carpets and furniture: After some years of experience with the troublesome pests, says the writer, I found a sure preventive of moths in pitch paper, the samo as roofers use. The moth will live and grow on cayenne pepper and tobacco, while I never could see tbat the use of these articles kept the moth miller out. The plan is to cut the paper in slips and place about tbe room under and hebind sofas, chairs, etc. Tbis sboald be done as early as the middle of April, and in warm climates earlier. To make parlor seats motb-proof, place on the inside of backs of chairs and seats small strips of pitch paper and rest assured the miller will not select these places to deposit eggs. It is the miller that is the foundation of all the mischief.

A WOOD FILLER.—There are many fillers in use for porous hard wood. A correspondent of Von Nostrand's *Engineering Magazine* suggests tbe following as very good: "Take boiled oil and cornstarch, and stir into a very thick paste. Add a little japan and reduce with turpentine. Add no color for light ash. For dark ash and chestnut, use a little raw sienna; for walnut, burnt nmber and a slight amount of Venetian red; for hay wood, hurnt sienna. In no case use more color than is required to overcome the white appearance of tbe starch nnless yon wish to stain the wood. The filler is worked with hrnsh and rags in the usual manner. Let it dry 48 hours, or until it is in condition to rub down with No. 0 sandpaper, without much gumming up, and if an extra fine finish is desired fill again with the same materials, using less oil, hut more of japan and turpentine."

CLEANING BRASS.—Make a mixture of one part common nitric acid and one-half part sulphuric acid in a stone jar; then place ready a pail of fresh water and a box of sawdust. Dip the articles to be cleaned in tbe acid, then remove them into the water, after wbich rub them with sawdust. This immediately changes them to a brilliant color. If the brass is greasy it must be first dipped in a strong solution of potash and soda in warm water. Tbis cuts the grease so that the acid has the power to act. This is a government recipe used in the arsenals.

COMPOUND FOR THE TREATMENT OF STEEL.—A Mr. Conant, of Prarie du Chien, Wis., has patented a compound to he used in the welding of steel or in the restoration of hurnt steel, composed of sulphate or other salt of copper, resin and sal ammaniac. This is thrown upon the metal under treatment thereby becoming incorporated with it.

QUININE FROM COAL TAR.—A New York man is said to have discovered a process for the manufactnre of sulphate of quinine from coal tar. The trade in the article is a heavy one, and if the new process should prove to be as successful as it is anticipated by the inventor, it will cause a revolution in the trade.

PAPER plates, as well as paper napkins, are in vogne in Berlin restaurants. Each plate is used but once, of course.

Cultivating the White Water Lily.

Many of our readers, especially tbase from New England, will ever hold in remembrance the sweet fragrance of the white water-lily, so common in that part of the Union. If they only knew how easily it could be cultivated, we believe that very many of them would prepare and ho quita as proud of their lily gardens as of any other of their floral premises. The roots may ho easily sent from the East hy mail, packed in damp moss. The roots should he kept constantly moist, until planted.

To do that take an old tub or barrel sawed in two, that will hold water, set it either on top or in the ground, one-third filled with a mixture of garden soil, sand and well-rotted manure. The roots should be set in this mixture, and water added in small quantities, so as not to disturb the earth until the tub is filled. Very soon the handsome round leaves, four or five inches in diameter will make their appearance and fill the tub. The loss of water hy evaporation should be made good from time to time, and ere long the blossoms will appear, and delight everyone with their beauty and fragrance. Care should he taken not to allow the annual increase to crowd the vessel, or the floral display will be diminished. The pure white flowers will be as perfect and beautiful and fragrant as the camellia, closing at night and opening in the morning. The bloom of lilies thus transplanted are generally a little smaller than in their native ponds at the East.

There are several parties in this city now successfully cultivating lilies in this manner. A flourishing colony of these fragrant flowers may also he seen in the conservatory at the Park.

SOMETHING NEW.—A recent German patent employs two boilers, one of which uses steam at a much higher pressure than the other. High pressure steam is used in connection with the injector to carry a portion of the exhaust steam from the engine into the low pressure boiler. To the above a contemporary says: "It would seem to he a peculiar combination and much like a man's lifting himself over a fence hy taking hold of his boot straps."

CASTING BELLS.—All bells, says *Iron*, are cast with their notes sharp, and the flattening of the note is then accomplished hy turning away more or less of the inner surface of the lip. To sharpen a bell's note there must be a slicing away from the lip, and this cannot he done to any extent.

Good Health.

Nature's Dressing for a Wound.

The *Phrenological Journal* gives, through a correspondent, the following lesson from a toad: A few years since, while standing in the shade during the heat of the day, a toad hopped along at my feet and attracted my attention from having what appeared to he a very large forearm. Stooping down, I found that from the shoulder to the elbow-joint the fore-leg was encased in earth, which was very smooth, dry and hard. Inquisitiveness being well developed, I had, of course, a natural inclination to see what was inside, so holding "toady," with a piece of stick I broke the crust of hardened mud, and found, to my surprise, a large flesh wound extending from the shoulder to the elbow, half of the muscle being bruised and raw. From the smoothness of the work, I judged the dressing had been made from dry earth and the spittle of the toad, as it would be seemingly impossible for it to handle mud and apply it in such a manner.

I thought nothing more of the matter for a year or more, until one night one of my children retired with a very sore toe from some unknown cause, and about midnight was wild and restless with pain. I arose and opened the ulcerated part, and afforded him relief for the time being; hut the pain returned, and hy the next hour he was as restless as ever. After trying to give relief in various ways I thought of the toad, and, taking an old stocking, I put some mud, made of clay and water, into the toe part, and drew it on the child's foot. In 10 minutes he was asleep, and slept well the remainder of the night, and in the morning the toe appeared nearly well.

I have found that a mixture of earth and spittle is preferable, and I have used it since upon every occasion where remedies are necessary for the relief of ulcers or healing flesh wounds, and prefer it to any ointment or liniment that I have ever seen or made during many years' experience as a druggist.

The Liver.

In the opinion of the ancients the liver was the seat of the affections and of the passions. Modern research, however, has shown this to be an error, and hence less attention and care have been bestowed on this organ than in the early days when it was supposed to play so important a part in making war and cajoling love. Undoubtedly the discovery of the fact that the liver is not the seat of the affections and of the passions, has led the people, as is natural, to neglect what formerly was an object of great solicitude; hut the truth still remains that though it may not be the special seat of love and passion, it is, after all, of the greatest importance in physical health.

The structure of the liver is delicate and yet simple. It is composed of two lobes, which lie directly under the right lung, and is of a spongy character. When the venous blood is circulating from the various parts of the body to the lungs, it passes through this organ, and is there relieved of its rank poisons, part of which are used for digestion and part for a cathartic of the waste materials of the food we eat. If the organ is at all diseased *these poisons remain in it*, instead of being used as nature designed, and with every coursing of the blood through the lobes of the liver the nature of the disease is intensified, and hence a neglect of any disorder in this organ is almost certain to bring on chronic liver disease, so terrible to contemplate.

NATURAL DEATH is to die sweetly without a sob, a struggle, or a sigh. It is the result of a long life of *"temperance in all things,"* and such a death should be one of the ends and aims of every human being, so that we may not only live long, but in that long life he able to do much for man, and much for God. The love of life is a universal instinct; life is a duty, its peril or neglect a crime. We are placed on earth for a purpose, that purpose can be none other than to give us an opportunity of doing good to ourselves and to others, and to be anxious to be *"off duty"* sooner than God wills, is no indication of true piety. The good man has one ruling, ever present desire, and that is to live as long on the earth as his Maker pleases, and while living to do the utmost he can to benefit and bless mankind, and to accomplish a long and active, and useful life, the study how to preserve and promote a high degree of bodily health is indispensable. And it seems to have been ordained by a Providence both kind and wise, as a reward of a temperate life, that such a life should he largely extended, and that its decline should he as calm as a summer's evening, as gentle as the babe sleeps itself away on its mother's bosom.—*Herald of Health.*

SALICYLIC ACID FOR BEE STINGS.—Although salicylic acid, from having been too highly extolled, has fallen somewhat into disfavor, there can he no doubt that it is useful in the case of bee stings. An Austrian paper recommends the following treatment: First, to remove the sting as quickly as possible with a forceps or by scratching with a finger, but never between the thumb and forefinger, because this squeezes more of the poison into the wound. Next, squeeze the wound until a drop of blood comes out, and rub the place as large as a dollar with an aqueous or dilute alcoholic solution of salicylic acid. The effect is still better by injecting the salicylic acid into the wound with the hypodermic syringe. After this the spot is painted with collodion to keep out the air. A sting treated thus causes little or no pain, slight inflammation and swelling, and is not followed by nettle-fever or lameness in the most sensitive and nervous individuals.—*Scientific News.*

FATAL PLAYTHING.—A Baltimore paper of July 11th says: A number of children have died here during the past few days from lock-jaw, superinduced by slight hurns received in the hands from the exploding of paper caps in toy pistols on the Fourth of July. In every instance where these accidents have occurred the dread disease has followed like a strange fatality. The physicians are unable to account for the singular appearance of the disease. The injuries have been so slight in some cases that only the skin of the hand was slightly burned. It is thought the caps contain a poison never before used in their manufacture, and the health authorities are about to investigate the matter. Eight deaths have been reported within the past twenty-four hours, and a number of new cases have been reported to-night. The sufferings of those afflicted have been terrible and beyond all medical assistance.

DIRECTIONS FOR PREVENTING SUDDEN DEATH. An exchange offers the following as the best known means of preventing sudden death: 1. Keep the head cool by taking the world easy. 2. Keep the lungs breathing deeply and fully about 17 times a minute, by cultivating alacrity in all the bodily movements. 3. Keep the heart beating about 68 times a minute (that is, let the pulse beat four times while the lungs breathe once) by eating temperately, sleeping fully and soundly, exercising moderately, and avoiding all temporary excitants, mental or liquid.

THE GASTRIC JUICE, when vitiated, as it always is in dyspepsia, poisons instead of acting as a solvent of the food, which decomposes in the stomach, giving birth to an acid, that, rising in the throat, stings the palate, and causes the disagreeable sensation called heartburn. Carbonate of soda and other means are often resorted to for the purpose of remedying this, but with no permanent good effect. The wiser way is to eradicate the atrocious disease, which originates this and a hundred other harassing symptoms, by a suitable diet. If that does not produce the desired effect within a reasonable time, call a physician.

DEATHS FROM OPPOSITE CAUSES.—A French newspaper relates that a millionaire lost his entire fortune, except about 100,000 francs, and died of grief within the 24 hours. His brother, who was his sole heir, had long struggled in poverty, and now, on the sudden receipt of what he regarded as a large fortune, has just died of joy.

MINING AND SCIENTIFIC PRESS.

A. T. DEWEY. W. B. EWER.

DEWEY & CO., Publishers.

Office, 202 Sansome St., N. E. corner Pine St.

W. B. EWER.....SENIOR EDITOR.

ADDRESS editorials and business letters to the firm. Individuals are liable to be absent.

Subscription and Advertising Rates.

SUBSCRIPTIONS—Six months, $2.25; 1 year $4, payable in advance.

ADVERTISING RATES.	1 week.	1 month.	3 mos.	12 mos

Saturday Morning, August 20, 1881.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Mining of Gold Quartz, 113-121 Passing Events; Tonite Powder; Organized Arizonians; An Extra Edition, 120. Mining in Mendocino County; Registering Mine Ventilation; Automatic Mine Draining Apparatus; Electric Lights in Mines, 121. Patents and Inventions; Notices of Recent Patents, 124.

ILLUSTRATIONS.—Machine for Washing Gold Alluvia 200 Years Ago, 113. Brunton's Ore Dressing Machine; Attwood's Machine for Trunking Slime; The Modern Rocker, 121.

MECHANICAL PROGRESS.—Progress in Iron Casting; What Becomes of Condemned Boilers; Brick Foundations for Machinery; Unfinished Tools; Singular Property in Steel, 115

SCIENTIFIC PROGRESS.—The Comet—Scientific Observations; Decomposition of Nitrates by Decomposition in the Dark; Science in China; Electrified Cloth; Distilling Alcohol by Ice; Absorption of Oxygen in Coal Mines, 115.

MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Notices of Assessments, Meetings and Dividends, 116.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, Oregon and New Mexico, 116-17.

THE ENGINEER.—A gigantic Engineering Enterprise; A Tunnel Through Mount Blanc; Engineering Feat, 119.

USEFUL INFORMATION.—Spontaneous Combustion; Moth Preventive; A Wood Filler; Cleaning Brass; Compound for the Treatment of Steel; Quinine from Coal Tar, 119.

GOOD HEALTH.—Natures Dressing for a Wound; The Liver; Fatal Plaything; Deaths from Opposite Causes, 119.

MISCELLANEOUS.—Geographical Society of the Pacific; The Scale Insect at San Jose; Pacific Coast Harbor Improvements, Garfield District, 114. The Youth of California; Cable Railroads; Sulphuric Acid as a Metal Separator; Success of the Stoombs Elevator; Hawthorne Items, 118.

Business Announcements.

Compound Oxygen—Starkey & Palen, Philadelphia, Pa.
Engineering and Mining Instruments—W. Y. McAllister.
New Mining Horse Power—C. H. Baker, S. F.
Fire Grate—Kearns & Caldwell, S. F.
Dividend Notice—Eureka Consolidated M. Co.

Passing Events.

The severe trial through which the President has passed during the week has absorbed the attention of the whole country. At this writing, Thursday night, symptoms are more favorable and a more hopeful feeling is apparent.

It is said that men have been put to work to explore the body of quartz cut some time ago by the south branch of the Sutro tunnel, at a point 300 ft. east of the Yellow Jacket shaft. It is certainly a deposit worth being looked after. It would seem by the rapid manner in which it widens to the northward, that what has been found is the extreme southern point of what may prove to be a first-class deposit.

A new discovery of a rich 10-ft. ledge has been made about two miles from the C. P. R. R. and seven miles west of Palisade. The people are said to be wild with excitement, and are all rushing to secure claims, town sites and water rights. The mine, being near the river with plenty of water and good water power, makes this a desirable location.

We give in this number of the PRESS a number of interesting articles worthy of careful perusal by all mining men. That by Mr. Attwood showing ancient systems of gold mining is of special interest.

The Mechanics' fair, now in progress in this city, attracts a great deal of attention, and is a success in every way. We shall next week give a complete catalogue of the exhibits, with descriptions of the more prominent ones.

THE July dividends of various mining incorporations disbursed in San Francisco, New York, Boston, and Philadelphia, amounted to $751,800.

Tonite Powder.

Interesting Experiments with the Powder at the Works.

On Saturday last a number of gentlemen were invited to the Tonite Powder works, near Stege station, C. P. R. R., to examine the process of manufacture of the powder and witness some experiments to demonstrate its strength, utility and safety. Some 70 persons accepted the invitation, among them scientists, engineers, miners, powder men, etc. It was, in our opinion, rather a compliment to the powder that so many were willing to visit the works, powder manufactories and pest houses, being among those places which the general public are reluctant to visit. However, those who did come were repaid their trouble in witnessing a series of well-conducted and interesting experiments, carried out in a manner reflecting great credit on General Manager Oliver, who gave all necessary information to the inquiring visitors.

The Works.

Probably before giving any detail of the experiments, it will be well to describe briefly the works of the company and the process of manufacture of the powder. The grounds consist of some 26 acres, suitably fenced. In the central portion are the buildings for the manufacture of Tonite powder, consisting of the large main building, engine and boiler room, office and factory, the cartridge buildings, packing-house, labeling room and storehouse. Each of these buildings is separate, and they are some distance apart. To the right of the group are a number of very small buildings, where are made the exploders or caps. In this department each man has a small house to himself, the whole being detached from the main powder works. To the right again, are the three large new buildings for the manufacture of black powder, these also being at some distance from the Tonite works. An endless wire rope from the main engine conveys the power to the black powder building. The large boarding-house is at the entrance of the works. The whole plant is admirably arranged, and some idea of its completeness may be learned from the fact that the machinery buildings, etc., cost $130,000.

Process of Manufacture.

The manufacture of Tonite powder is quite complicated, and requires much machinery when compared with that of other explosives in use. Most powders are made in one day, or at most two days, but Tonite requires between two and three weeks from the time the operation commences until the powder is ready for packing. During the process of manufacture the powder is either entirely or partly in water, and is not explosive at all until the last day of the operation, when it is ready to be packed into cases; hence no accidents have occurred during the manufacture of Tonite, which has now been going on for six years.

Tonite powder is a gun-cotton powder, and contains no nitro-glycerine, the gun cotton being rendered non-explosive, except under certain specified conditions, by the peculiarities of manufacture.

In the first place the ordinary cotton, wool or other vegetable fiber is thoroughly washed, cleaned and purified. It is then taken out and steeped or digested in a mixture of nitric and sulphuric acids. This is done in large earthenware pots having covers. The men who have charge of this part of the work have an unpleasant task, breathing through sponges and wearing rubber clothing, gloves and boots. The soaking mass is lifted and placed in a press where the superabundant acid is squeezed out by hydraulic pressure. It is immediately returned to the earthen pots, which are quickly set in shallow vats or tanks through which water is constantly passing and where a uniform temperature is maintained.

After a suitable time the pulp is removed from the pots and then it is carefully washed until all traces of acids are removed. This simple operation converts the cotton into what is known as gun cotton. Revolving knives cut it up into a paste. It is then crushed under rolls and again washed by a process peculiar to the Tonite company, and not employed by other gun cotton manufacturers. During the purification process, samples are taken regularly of every batch of 200 lbs. and tested—

1st. For percentage of gun cotton, etc.
2d. For decomposition by heat.
3d. For degree explosibility.

In the second test the powder is subjected to a steadily increasing and prolonged heat, and if it shows the slightest tendency, by means of specially prepared delicate test papers, to decomposition at a temperature under 250° Fah., the batch is repassed through the purification process. In the third test the powder is subjected to a temperature of 300°, which is gradually raised to 400°, and if it explodes before it reaches 360° to 370°, it is passed through an extra cleansing operation and again sampled and assayed.

When the tests are all found to be quite satisfactory, the other ingredients are added which convert the gun cotton into tonite, the whole being ground and mixed. The nitrate of baryta has the effect of so changing the qualities of the gun cotton as to admit of its being handled with perfect safety, and preventing any decomposition. In fact we saw samples of tonite five years old exploded in the ordinary way, showing that the compound was a stable one not liable to deterioration or alteration by age.

When the powder is thus made it is compressed into cartridges by the aid of powerful presses. At each of these three men work; one weighs, one fills the press and the third removes the cartridge and cleans the mold. Different series of molds are used for different sized cartridges. The cartridges are wrapped in paper and then dried in drying-rooms, and are now for the first time rendered explosive, but even then it is a singularly insensitive material, as will be seen from the experiments referred to hereafter.

No powder is made into cartridges until it has resisted all of the above severe tests, the standards of which, adopted by the company here, are higher than those established by the British government before the powder is admitted aboard its men-of-war. Consumers of Tonite can therefore rely upon the quality and safety of the powder they are using, as the company makes one and only one grade and one quality of powder.

So much for the manufacture of this powerful explosive which is quite simple when the results are considered. The experiments with the powder showed its character very plainly to all who witnessed them. We shall detail them in the order in which they were exhibited.

The Experiments.

1. This was to show the safety of manufacture. A lighted torch was thrust into a quantity of loose powder ready to be made into cartridges. Being damp, it did not at first burn, but on drying, part of it burned slowly but did not explode.

2. A number of freshly made cartridges were laid loosely on top of a piece of Giant powder cartridge, and the latter exploded in the usual manner. This severe test had no effect on the Tonite.

3. This and the following were fire tests. A number of dry cartridges were lighted, and they burned away with a yellowish flame, but very little smoke.

4. This experiment was repeated with three varieties of nitro-glycerine powders, to show that they burned more rapidly and emitted more smoke. Some of the insurance men present then called for an extra test, to see whether a burning cartridge of Tonite could be extinguished with water, and whether a spray of water would (by its decomposition) increase instead of decrease the combustion. Four large cartridges were set on fire, and when freely burning, the superintendent was asked to throw a fine spray upon them. This was done, but no effects were visible. A heavier spray was thrown, but that made no change. Then the stream was turned on and the burning cartridges were extinguished. This was to the insurance men a very satisfactory test, showing that an incipient fire among a lot of cartridges could be arrested, and that a spray of water would not add to the flames.

5. This and the following were friction tests. A Tonite cartridge was rapidly filed with a sharp new file, but it did not explode or take fire.

6. Another cartridge was rubbed to dust on a rubbing machine under a muller, both box and muller being roughened with powdered glass. This heated the powder, but did not set it on fire or explode it. This test was so severe, some thought the cartridge might have been prepared, but the superintendent took a cap and exploded the powdered cartridge.

7. This and the following were percussion tests. Three cartridges of Giant, Hercules and Vulcan powders were placed in a row, and 24 inches apart, each on top of a separate spiked stick. The Hercules cartridge was in the center, and was fired at from about 100 ft. with a Winchester 1,000-yard rifle. The blow of the bullet exploded the Hercules cartridge, and its explosion exploded the others on each side of it.

8. Three cartridges of Tonite were placed on the sticks, and when the center one was struck by the bullet from the rifle it was broken in two but not exploded. The other two were treated in a similar manner, and none of them exploded.

9. This was a concussion test, as was that which followed. A cartridge of Tonite was placed between a cartridge of Giant and one of Hercules, 24 inches between each, and the Tonite was exploded with fuse and detonator. When the Tonite went off, the others also exploded.

10. This was a crucial test of the powder. A cartridge of Tonite was placed only four inches from one of Giant; and another cartridge of Tonite was placed only four inches from one of Hercules, the space between the Hercules and Giant powder cartridges being 24 inches. The Hercules and Giant were simultaneously exploded (the discharge of one firing the other); but the Tonite cartridges did not explode. They were blown to fine dust, some of which lodged on blackened prepared boards placed near by. This proved conclusively that the concussion required to explode the Tonite was greater than that required to explode the others.

11. An ounce of Dupont black powder was then put in a mortar and a tight-fitting cartridge of Tonite rammed upon it, and the gun powder fired with fuse. The Tonite, even under this test did not explode. A piece of the broken cartridge which fell was recovered and exploded by means of the cap.

12. The same experiment was repeated, but this time the Tonite had a detonator and time fuse attached, to enable it to ascend 600 ft. before exploding. A number of these rockets were sent up, such as are used for fog signals by the English government at stations where steam whistles or sirens are used, while steam is being raised. Some of the rockets have stars and serpents, which fly out when the cartridge explodes.

13. Was to show the strength of Tonite and that it had a downward force like nitro-glycerine. This test was omitted, as it had already been determined by exploding cartridges laid on heavy pieces of timber.

14. Holes in the ground were fired with Tonite and dynamites. There was no means of measuring any difference in results.

15. Several Tonite cartridges were thrown into the bay and detonated, throwing up heavy columns of water.

16. A heavy iron weight rigged up similarly to a pile driver, so as to drop on a heavy iron anvil, was allowed to drop on a piece of Giant powder cartridge from a hight of five ft. Between these two iron surfaces the Giant was exploded, the weight probably squeezing out the nitro-glycerine and exploding that. At all events, it blew up and broke the ring off the weight. When that was repaired a piece of Tonite cartridge was tried.

17. With the Tonite cartridge placed on the anvil, the weight was this time hoisted 24 ft. instead of 5. It dropped and mashed the cartridge, but did not explode it. This was a very severe test.

18. The same experiment, 24 ft. drop, was tried on boxes of Tonite. The weight was dropped on one box with its cover on and on another with the cover off, but no explosion resulted. Some of the broken cartridges were then exploded by means of caps.

19. Several boxes of Tonite were thrown on a large bonfire saturated with coal oil. The cartridges burned, but did not explode.

This concluded the experiments, which, if the reader has followed us, will be seen to have been very thorough in every respect, and to have proved that this high explosive can be subjected to very severe tests of safety, fire, friction, percussion, concussion, strength, etc. All this has, of course, been proven in Europe, where it has been for some time in use, but here it is comparatively new, though now being rapidly introduced.

The company have also the only factory for caps and detonators in the United States. They manufacture Giant triple-force caps, Ætna caps and Tonite detonators. The Tonite detonators have to be made about three times as strong as the ordinary ones, very great force being required to explode the Tonite cartridge. We shall at some future time describe the cap more in detail.

Organized Arizonians.

Several meetings of former Arizonians and those now residents of that Territory, but sojourning in this city, have recently been held at the Palace hotel, which finally resulted, on Monday evening last, in a permanent organization on a business and social plane as "The Mining Bureau of the Territory of Arizona," with the following officers: President, J. F. Knapp, of Yuma; Corresponding Secretary, David Rich, of San Francisco; Executive committee, W. A. Rowe, of Yavapai county, W. A. Caldwell, of Mohave, G. C. York, of Apache, L. C. Hughes, of Pima, Donald Rohh, of Gila, R. Cohen, of Cochise, J. W. Dorrington, of Yuma, J. W. Stevenson, of Graham, J. W. Anderson, of Pinal, and Joseph A. Drew, of Maricopa.

Arrangements are being made with Prof. H. G. Hanks, of the State Mining Bureau, for a proper display of all mineral specimens which may be forwarded to him. It was stated at one of the meetings, that at all times of the year, there are from 200 to 300 Arizonians in this city, and any organization which will bring them together will be of advantage in both a social and commercial point of view. Greater interest and a more close union would also be thus kept up between the people of Arizona and the merchants of this city.

The office of the association has been located for the present at 212 Sutter street. It will be under the immediate charge of Mr. Hanks.

An Extra Edition.

We shall next week issue a 24-page edition of the MINING AND SCIENTIFIC PRESS, with a catalogue of the exhibits of the Mechanics' Institute Industrial Exhibition now in progress in this city. This edition will contain also descriptions of many of the more prominent exhibits of the fair.

We have prepared several articles of special interest for this extra number, among them a fully illustrated one of great value showing the various attempts to perfect the cable railroad system. A prominent view in Golden Gate park will be one of the interesting illustrations. Numerous other articles on mining, metallurgical and mechanical subjects will appear. We shall print a very large edition, and this number will be one of value for reference and preservation.

BUTTE, Montana, is now within 30 hours' travel of Salt Lake. When the Utah & Northern is completed, the time will be shortened about six hours.

Mining in Mendocino County.

The Mendocino flume and mining company is a new incorporation having for its object the flumming of lumber from the redwoods 20 miles northwest of Ukiah, the county seat of Mendocino county, to Calpella, six miles from Ukiah, and in the line of the proposed new railroad from San Francisco to Humboldt bay, and north to connect with Villard's Northern Pacific, and the mining of some 800 acres of gold-bearing surface diggings near Calpella. The company is incorporated in Boston, where most of the stock is held, and the officers reside. They have acquired title to the mining ground, and purchased some 2,000 acres of timber land including a fine sawmill and a lake three-fourths of a mile long and 70 ft. deep, which it is proposed to tap for additional water supply should other sources at any time fail. The gold is fine, and found in the grass roots and all the way down as far as prospected, bedrock never yet having been found.

The soil is a light sandy, washed gravel, easily worked, with no clay known. It has never been worked except a little during the rainy season with rocker or tom, when from $2.50 to $4 per day was made. The company only began work in the latter part of July, and are now engaged in building a temporary reservoir and the permanent flume, for taking lumber and water to their mining ground and Calpella, 12 miles distant. Three tunnels will be necessary. The dam across Mill creek ravine is progressing as fast as possible. It will be 150 ft. long and eight ft. high, built of logs, brush and earth, and faced with heavy planks, which will be sunk to their places with a pile driver. The head dam will be 80 ft. long and eight ft. high.

Flume work is proceeding briskly. A mile of trestle is in place, and water is flowing through three-quarters of a mile of 36-inch flume, carrying material for its extension.

Nine men are working on Smith's tunnel, which will be 315 ft. long when completed. The total number on the pay roll is 91.

Carpenters have been building cabins for some of the directors, who will come from the East shortly.

Mr. Bellows, the Supt. (and who built the Miocene flume), has endeavored to obtain iron for a tramway, to convey logs to Reeves' mill; but such was the demand for iron that his order could not be filled earlier than November.

Donahue has a surveying party in the field above Cloverdale, looking to an extension of his road, and Villard has had four parties out this spring above Ukiah. With these indications this mining camp is likely to be lively.

Electric Lights in Mines.

We have several times referred to the Swan electric lamp now in use in England, more particularly relering to its use in mines. It is worthy of note now that the Royal Commissioners upon Accidents in Mines, including Prof. Abel, Mr. Warington Smyth, Prof. Tyndall, and others, have made an examination of the experiments on the application of electric lighting to coal mines, which are being carried out at the Pleseley colliery, near Mansfield. The pits are about 1,600 ft. deep, and the workings are very extensive, but in the present instance the light was applied to three workings only, situated at a distance of about one-third of a mile from the bottom of the pits. The Swan system was adopted, and the arrangements were carried out by Messrs. R. E. Crompton & Co. The lamps themselves were enclosed in lanterns of a very ingenious construction, designed and made by Messrs. Crompton, which enabled the very fragile glass bulbs to be carried about without fear of accident, and at the same time rendered it impossible that the fracture of the lamp within could cause an explosion, inasmuch as the air inside the lantern would suffice for the instantaneous combustion of the carbon filaments before the flame could be communicated to the external air. In working the coal, the men undercut the face to the depth of some five or six ft., and the superincumbent mass is then brought down by wedges or blasting. It is said that the new lamp was found to be admirably suited for the requirements of the workers, since it not only gave a light many times as intense as the lights it replaced, but it was equally brilliant in whatever position it was placed, and it required absolutely no attention. In addition to the lamps which were used in the actual workings of the pit, the pit bottom was lighted up with similar lamps. The number of lights employed was 94 in all, which were worked by the current of an ordinary Gramme machine driven by a portable engine placed near the top of the upcast shaft.

THE EXPLOSION AT MAZATLAN.—A disastrous explosion occurred at Mazatlan recently. One from there places the loss of life at 100 killed; another says 35 killed and 60 wounded; another says 50 killed. The powder was not in a magazine, but in a dwelling house where people were cooking, etc. The house took fire at 6 A. M., and some persons in the vicinity, knowing of the presence of powder fled, thus saving their lives. Others not knowing of the powder, or delaying their flight, were killed. We are informed that there were 5,000 pounds of Dupont black powder, 4,000 pounds of Giant, and 1,100 pounds of Tonite; enough in all to have blown Mazatlan into "kingdom come." The only wonder is more people were not killed.

Registering Mine Ventilation.

About a year ago, Mr. Joseph Dickinson, H. M., Chief Inspector of Mines and President of the Manchester Geological Society, called attention, in his annual report, to the need of an automatic or self-registering apparatus for recording the periodical revolutions of ventilating fans and the weight of the water gauge at mines; the subject having come formally under his notice and been represented to him when assisting in the investigation of the Risca explosion last summer, as well as from instances which be afterward found in going into the matter in his own district.

Mr. Dickinson's suggestion was taken up, and a firm at Manchester has begun to make an instrument for the purpose, which he described at a recent meeting of the society. The appliance is a modification of Messrs. Bailey's well-known clock recording apparatus, and consists of an eight-day clock, which drives a drum about 8 in. diameter, to which is attached a paper divided into all the hours of the week. As the drum revolves, the fluctuations of the air passing through the mine are recorded upon it, up to 6 in. of water-column pressure. The speed of the engine when the fluctuations occurred is also recorded upon the drum by means of a pricker, which punctures a diagram once for every 5,000 revolutions of the engines connected with the ventilating apparatus. There is thus given in a concise form the speed of the engines and the fluctuations of the air pressure for every hour during the week's work. Mr. Dickinson added that, if desired, there would be no difficulty in constructing a modification of the instrument which would show also the fluctuations of the atmospheric pressure. He hoped to see instruments such as these become general at all collieries where ventilating fans were in use.

THE bullion product of Storey county, Nevada, according to returns to the Assessor, for the quarter ending June 30, 1881, was as follows: Belcher $42,525, California $46 880, Con. Virginia $32,558, Crown Point $116.755, Con. Imperial $29,103, Monte Cristo $6,600, Savage $5,719, Sierra Nevada $92,338; total $372,528. The total for the previous quarter was $426,353, making a total for the first six months of 1881 of $798,881, against $2,754,796 in the same time in 1880 and $4,325,479 in 1879, showing a steady falling off. The product for the first six months of 1881 was only about a week's yield in 1875.

DURING the first three weeks of July the Ontario mine produced $177,400. The usual dividend of 50 cents per share was paid in New York this week.

Automatic Mine Draining Apparatus.

Joseph R. Wilcox and Chas. D. Farquharson of this city have just obtained through the MINING AND SCIENTIFIC PRESS Patent Agency, a patent on an apparatus for raising water from wells, mines, etc., the principle of which invention is the same as that set forth in a previous patent to Wilcox in 1879, in that a column of water is made to accomplish the desired result. The present invention, however, differs from the former in a simpler construction of its parts, whereby they are enabled to dispense with the cumbersome double pipes and double columns of water and use but one actuating column of water and one pipe.

The invention consists, briefly, of two sets of cylinders, each set composed of two cylinders having pistons, the pistons on each set being connected so as to move together. One set of cylinders is placed in a mine or well, and the other set is placed at a point outside, lower than the position of the first set. A pipe passing from the inside set up the shaft of the mine or well and over the top down to the outside set, connects the two. This pipe is filled with water. The inside set is provided with a suction pipe, the outside with a discharge pipe. Appropriate weights, valves and operating cocks, control and operate the device.

The object is to raise water from mines and other places, or such localities as offer facilities for a proper fall, this object being accomplished by a very simple application of the heavier part of a column of water to a series of pistons moved by said water.

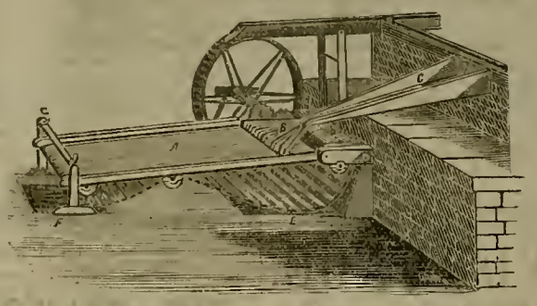

FIG. 2.—BRUNTON'S ORE DRESSING FRAME.

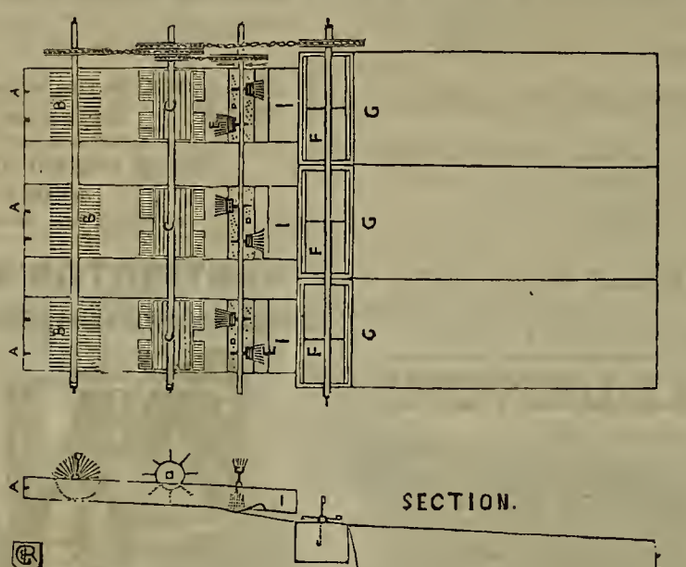

FIG. 3—ATTWOOD'S MACHINE FOR TRUNKING SLIME.

Fig. 4—The Modern Rocker.

THE Calumet & Hecla copper M. Co. of Michigan has declared a quarterly dividend of $5 per share, equal to $500,000, payable in Boston yesterday. This makes a total of $19,850,000 paid out in dividends by this company. Outside of the California and Con. Virginia, no mine in this country, as far as we know, can present such a record.

The Milling of Gold Quartz.

[CONTINUED FROM PAGE 113.]

phurets the pyritic matter varies from 70% to 90%, and about 75% of it will pass through a sieve of 100 holes to the linear inch.

The following analyses were made by John A. Phillips, F. G. S., and published in his Metallurgy of Gold and Silver. I lately received a letter from him, wherein he tells me he is going to publish another work on gold:

Analyses of Auriferous California Pyrites Concentrated from Tailings by John A. Phillips.

Silver	11	10	0				3	18	0

The condition of most of the Gold in Californian Sulphurets is much the same as that met with in the St. John del Rey mines, and if treated in the same way will amalgamate as easily. It only wants to be reduced a little finer. It will be time enough to adopt any of the new processes for the treatment of *rebellious gold ores* when they discover *any other ore* of gold, except telluric gold, which, so far, has only been met with in small quantities. In a pamphlet published by Mr. Kitto on the Gold Fields of Victoria as far back as 1867, Mr. Kitto states that the average

Cost of Mining and Milling

Of the gold quartz in the Victoria district was under 13%. say, $3 per ton. Some of the mines were deeper than those in the Bodie district, and the veinstone much harder to stamp, and the gold, unlike that of Bodie, which is mostly free, was mechanically mixed with the pyritic matter, and consequently much more difficult to save. The Port Philip Co. had, up to 1866, stamped 388,681 tons of veinstone, which yielded gold equal to six tons of 2,000 lbs. each. For four weeks' returns, October of that year, the quantity of quartz stamped, 4,342 tons, yielding 1.355 oz. 10 dwt. of gold, an average of 6 dwt. 5½ grains per ton—a little more than $6. The receipts were £5,944 4s. 6d.; payments, £4,300 13s. 7d.; profit, £1,643 10s. 5d.

The introduction of the Comstock pan system may have caused the shutting down of the Mammoth and many of the Bodie mines which produce low-grade ore. The wet-stamping of rich silver ores is a great mistake, and even in the wet-stamping of low-grade silver ores, unless they contain a large proportion of chlorides, they should be concentrated before amalgamation.

Concentrations on a small scale can be made much closer with the Bates than any other instrument, and consequently it is very useful in checking the working of large machines.

A great deal of useful information may be obtained from "Baron Inigo Born's" book on "Amalgamation," published in 1791, wherein he describes and illustrates with drawings, the process of "Movable Casks for Cold Amalgamation.

Careless Working.

A copper miner who understands anything of his business, would be horrified if you were to propose to him to work his mine after the fashion of some of our silver mines; that is, neglect to make a careful assorting of the richer ores when broken underground, and at the grass to mix rich ore with comparatively waste rock, and then pass them together through the stamps, taking the chances afterward of whatsoever they may be, to recover the ore by pans, etc. He would tell you how much would be lost and carried away in suspension with the water, and what a large proportion would go to enrich the slime pits.

In the treatment of low-grade silver ores the concentration of the ore after stamping by such a machine as the "True concentrator," would, I think, reduce the cost of milling and at the same time save more silver. I take this opportunity to express the pleasure it gave me on visiting

The State Mining Bureau

To see how well and with what great taste the collection we presented to that institution was arranged, and also the satisfaction I felt that the joint labor of so few should have been so soon crowned with success. We must not forget, however, that through the liberality of Mr. John Mackay we were enabled to send the collection to the Paris exhibition of 1878, where it won for this State a gold medal—proving its great value.

In the Mining Bureau it may be said to have formed the nucleus of a collection for industrial purposes which has already grown so rapidly that it is superior to any on this coast, filling a gap so much needed; indeed at the rate in which donations of minerals, etc., are pouring in, that institution will soon become a place of great resort, and the public will then feel grateful and award to Mr. Joseph Wasson the praise he so justly deserves for the forethought and trouble he has taken to procure for them an institution of such a useful character.

SECURE PATENTS

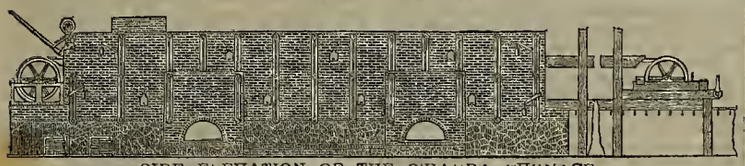
Through Dewey & Co.'s **Scientific Press** Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long established, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensivo law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent bnsiness, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG

THE O'HARRA
CHLORIDIZING FURNACE.

Patented in 1878.



SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

—o—

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1.10 per ton to work 40 tons in 24 hours.

At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61½.

Lewis Chalmers, of the Isabella G. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenial sulphurate of silver up to from 84% to 95% of the assay.

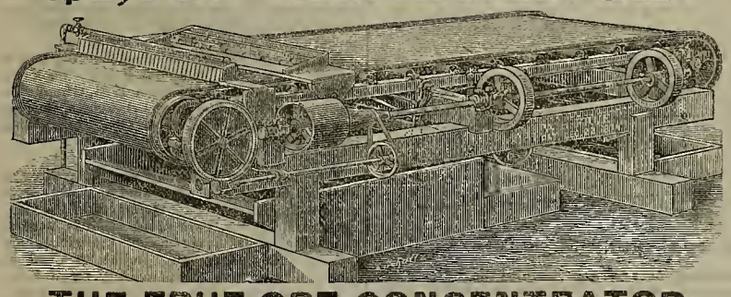
$1,000 CHALLENCE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

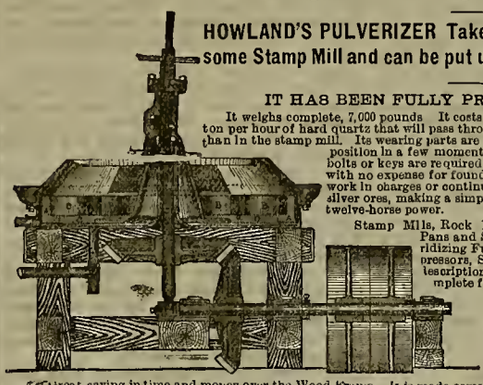
MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies. Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞ Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

DuBOIS' Automatic Quicksilver Feeder.
A machine for feeding quicksilver to the mortars of GOLD MILLS. It is so connected to the cam shaft, that each revolution of the large ratchet wheel, which can be regulated to revolve once in one, two, three or four minutes, as desired, dips a small cup into a reservoir of quicksilver, and by a mechanical movement, empties the contents into a pipe leading down to the mortar, supplying an exact quantity at regular intervals, superseding ordinary hand-feeding, which is of necessity subject to great irregularity, and liable to neglect. It renders the amalgamation of all the gold in the pulp equally certain and perfect. Price complete, $100.00. Send for circular,

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.

FOR THE WEEK ENDING AUGUST 9TH, 1881.

245,337.—HEADER ATTACHMENT FOR HARVESTERS—F. R. Allen, Modesto, Cal.

245,341.—ROTARY HARROW—W. A. Bell, Adelaide, Cal.

245,436.—ACOUSTIC TELEPHONE—J. B. Bennett, San Louis Obispo, Cal.

245,344.—STEP LADDER—W. H. Bray, S. F.

245,273.—SWITCHING ATTACHMENT FOR STREET CARS—W. T. Browne, Stockton, Cal.

245,351.—VALVE MOTION AND GOVERNOR FOR ENGINES—Collins & Barrett, Vacaville, Cal.

245,352.—INSULATING WIRES—A. W. Cornwall, Black Diamond, Cal.

245,481.—BLIND FINISHING MACHINE—L. C. Graupner, Red Bluff, Cal.

245,305.—REIN HOLDER—W. P. Merrill, Florin, Cal.

245,556.—VEGETABLE PRESS—W. S. Plummer, San Jose, Cal.

245,403.—FLANGE CONNECTION—I. M. Scott, S. F.

245,320.—BOTTLE CORKER—Thos. Threlfall, S. F.

245,539.—DEVICE FOR RAISING WEIGHTS WITH JACK SCREWS—W. W. Vaughn, Stockton Cal.

245,583.—SAW—H. E. Van Bibber, Skagit, W. T.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

HARROW.—Morris Van Gelder and Frank Batchelor, Sacramento. Dated August 2, 1881. No. 245,033. The invention refers to certain improvements in that class of harrows on which curved or other forms of elastic teeth are secured to the harrow frame, either above, below, or at one side, so that their points will enter the ground and pulverize and cultivate it. It consists in the employment of a shoe or shoes, or projections, beneath the harrow frame, between it and the fastening clip, to which the teeth may be secured, so that while the teeth may be adjusted to enter the ground to any desired depth, the harrow frame will be prevented from dragging upon the surface of the ground. This attachment will be found of great advantage in protecting the harrow from wear, and in raising the frame from the ground so that it will not become clogged, while allowing the teeth to work to any desired length.

FOLDING SEATS.—George H. Fuller, S. F. Dated August 2, 1881. No. 245,153. This folding seat is of peculiar construction, difficult to describe without the aid of engravings. The whole seat when opened is very rigid, and is particularly adapted for use at halls, where it is often necessary to pack the seats into a smaller compass to clear the floor. The curve of the back and back legs, the front legs and the seat bottom correspond so nearly that when its parts are folded together, the front legs follows the curve of and rest upon the back legs, while the seat follows the curve of the back and lies between the front and rear legs; so that the whole device only occupies a space equal to the thickness of the legs.

ROTARY HARROW.—Wm. A. Bell, Adelaide, San Luis Obispo county, Cal. Dated August 9, 1881. No. 245,341. This invention relates to the class of rotary harrows, and more particularly to certain improvement in the balance and draft bars. It consists in rendering the draft bar adjustable and in necessary attachments to said draft bars, whereby its adjustment is effected. It further consists in an improved balance bar, its novelty consisting in its adjustability from one side of the harrow to the other, or at any point between to adapt the implement to all kinds of work.

VEHICLE SPRING.—George G. Buckland, Tulare. Dated August 2, 1881. No. 245,129. This invention relates to certain improvements in springs and running gear of vehicles, and it consists in a means of attaching the springs to the head-block and rear axle; also in a novel cross-frame, and a means for securing it to the springs, and in a support for the king-bolt. These improvements are intended to be used in connection with a patent granted to the same inventor on March 15, 1881, No. 238,847, and heretofore described in these columns.

STEP LADDER.—W. H. Bray, S. F. Dated Aug. 9, 1881. No. 245,344. The construction of this appliance enables the inventor to make a convenient and strong step ladder, and dispense with all side stays and braces, and to convert it from an ordinary single step ladder, into one having steps on both sides or into two separate ladders. This was described in full and illustrated in the MINING AND SCIENTIFIC PRESS of August 13, 1881.

A FRUE ore concentrator, with all the late improvements, and in perfect working order, is now kept by Adams & Carter, at the office of Hinckley, Spiers & Hayes, 220 Fremont street. The machine is ready to make tests, so that people who desire may try their ore upon it. There are 300 of these concentrators now in use on this coast.

Work on the Lick Observatory.

A reporter of the San Jose *Herald* lately visited Mt. Hamilton to see the progress of work in preperation for the construction of the Lick observatory. Upon the summit he found a level tract of about 10 acres, which had been cut down for the erection of the observatory and additional buildings. In some places the top had been cut down as much as 50 ft. Most of this work was done by the strongest blasting, as the summit is almost solid rock. The debris from the blasting was rolled over and graded up to extend the limits of the summit. When some of these large rocks would be loosened, they would roll down the side of the mountain, sometimes for a mile, cutting brush, trees and everything else in their path. The observatory and all the main buildings are to be built of brick. The brick is now being burned near the summit. Those supervising this matter have been very fortunate in finding the finest and best kind of clay for this purpose.

The water supply is from a natural spring about a mile north of the summit. The place is higher than the site of the observatory. The water is forced out by engines with great power and sent in great supplies to the place of work. It is pumped into four large tanks.

The buildings will be commenced early in September, and the work pushed forward as rapidly as possible until their completion. Prof. Burnham, the celebrated Eastern astronomer, who was here about a year ago, will return this fall, and study the heavenly bodies from Mt. Hamilton, as he says it is about the most favorable locality in the United States.

Fighting Adulterations.

The Empire State is taking the lead in efforts to stamp out the adulteration of foods, drugs, etc., and we trust the measures now adopted will prove adequate. Other States as well as New York have begun to do something to bring the anti-adulteration laws into force, and the outlook is hopeful for a commotion at least. Adulteration laws are harmless after they have been carefully embalmed in the statute books, with no especial inducement for anyone to prosecute under them, unless he is a pure philanthropist who enjoys pursuing evil on his own account, and at his own expense. In New York the matter has been placed in charge of the State Board of Health. Inspectors have been appointed to collect and analyze samples of butter, beer, baking powders, bakers' chemicals, cocoa, cordials, canned food, confections, cereals, cheese, meat extracts, fish and fish extracts, fruit essences, ether, gelatine, honey, ice cream, milk, molasses, lard oil, olive oil, quinine, sugar, syrups, soda water, spices, spirits, tea, wine, and also all pharmaceutical preparations. The object of this analysis is to carry into execution the law enacted by the Legislature at its last session, to prevent the adulteration of food and drugs. Judging from similar investigations already made in New York and other States, startling results can be looked for from these examinations. When this evidence has been gained, it is to be hoped that the pursuit of the adulterators will be unyielding.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

ETNA M. CO.—Aug. 15. Location: Nevada. Capital, $600,000. Directors—C. Borger, B. W. Mudge, J. L. Sanford, Daniel Buck, W. Aug. Knapp.

MEDORA M. CO.—Aug. 15. Location: Nevada. Capital, $10,000,000. Directors—Thomas H. Caswell, Joseph Warburton, J. Landers, Hiram Crowell, Henry K. Mitchell.

SIERRA LAND AND IMPROVEMENT CO.—Aug. 15. Location: California. Capital, $500,000. Directors—A. J. Rhodes, Roswell Lee, Crowson Smith, J. B. Emery, S. M. Miller, M. A. Wheaton and Daniel Buck.

VAST EXPLORING EXPEDITION.—The Northern Pacific railroad company and the Oregon railway and navigation company have united in putting a scientific exploring expedition in the field, for the purpose of examining into the mineral, agricultural and other resources of the territory tributary to the two companies between Lake Superior and the Pacific coast. Prof. Raphael Pumphelly, until now in charge of the coal and iron department of the last national census, has been appointed chief of the vast field of operations, which will be explored by separate parties under the chief direction of Prof. Pumphelly. The latter has already started for Montana, for the examination of the principal mining districts in that territory. The task of the expedition will extend through several years.

THE Russian Minister of the Interior is considering measures for preventing the productive power of the people being improperly turned to account by speculators. It is intended to establish official control over all the Russian grain markets, and over the exports from Odessa, so as to lower the price of grain in the Empire of Russia.

THE San Diego *News* says: The disease so destructive to cattle, and particularly to calves, originated, so far as is known here, at Tecate and Potrero, the first in Lower California, and the last in California. It is destructive at Laguna and has gone into Pine valley where it is doing its work.

News in Brief.

THE Monterey Whaling Company will begin operations on the 1st of September.

WAGON loads of immigrants from Missouri and Kansas are daily arriving in Baker City, Or.

A NEW town has been established above Lovelock's, Butte county, and is named Junction.

THE Carson Mint will not start before the 1st of October. They are busy building the new refinery.

AN Atlante (Ga.) dispatch says the General Assembly has defeated the Temperance bill—20 to 19.

CLAUS SPRECKLES of San Francisco purchased a large herd of mules near Chico for shipment to the Sandwich Islands.

BEFORE snow comes, says the *Republican*, Truckee will again be on its feet, so to speak, and pursue even the tenor of its way.

LARGE numbers of Indians are in the Mogollon mountains, Arizona, and the timber is afire in all directions. The grass is all burnt and cattle are in a bad fix.

AN unsuccessful attempt was made to wreck an excursion train having on board 550 men, women and children, by laying ties across the track near San Antonio, Texas.

AN American missionary, after an interview with General Ignatieff, Minister of the Interior, obtained from him an order directing the authorities of the Caucasus to grant him facilities for pursuing his labors.

ABOVE 10,000 troops have signified their intention to be present at the Yorktown celebration. It is believed that the militia alone to take part in the celebration will exceed 30,000. Many States will send full regiments.

IT is reported that the Vatican insists upon the abolition of the tribunal for a trial of ecclesiastical cases, as a preliminary condition of yielding upon the question of notifying the Prussian government of clerical appointments hereafter.

THE Bannock and Shoshone Indians have consented to provide for the occupation by the Utah and Northern Railroad Company of a strip of land across their reservation, amounting in the aggregate to 772 acres. For this the Indians receive $6,000.

AT Yaquina bay the railway is laid, and cars built, and they will commence next week to lay stone on the breakwater. The large wharf has been thoroughly stanchioned and braced, previous to landing the rock. There is about $9,000 yet to be expended.

AT Tom Hughes' Colony at Rugby, Tenn., two deaths occurred on Saturday, and there are 20 well-defined cases of typhoid fever from bad drainage and water. The settlement has a population of 400. A corps of doctors and nurses have been forwarded.

THE Division Superintendents of the United States Railway Service met in Washington recently, to discuss the question of providing some method for heating postal cars in winter that will not endanger the burning of the car in case of accident to the train.

JACOB BLINN and Jacob Rich, two old Shasta county pioneers, have resided and been partners on Long gulch for the last 27 years. Last Monday Blinn committed suicide by shooting himself with a rifle. He was about 56 years old, and his partner was past 73.

SOUTHERN Arizona exchanges are filled with accounts of floods that have done great damage to mills, dams, crops, etc. Every river was up, and old-time dry places were brimful of water. One train was 72 hours making its way from Yuma to Tucson, less than 300 miles.

FORTY miles of the main line of the Canadian-Pacific is completed west of Portage la Prairie. The grading on the whole line between Winnipeg and Portage is in progress. Track-laying has been commenced, and the road is expected to be ready for traffic by November.

IN Placer county, during the foothill fires of last week, Mrs. W. M. Foster, who is entirely blind, asked her son Willie, six or seven years old, to lead her up to her father's for safety. On reaching there the little boy went to the spring for a drink, fell in and was drowned.

NAVIGATION on the upper San Joaquin, above San Joaquin City, is now impracticable on account of the low stage of water. A large amount of wheat, estimated at 800,000 sacks, has been brought out by the steamers, although it has been estimated that fully one-half of the present crop will have to be stored until the water again rises.

SPEAKING of the Nevada and Oregon Railroad, the Reno *Gazette* says: The Plumas county branch will strike through Beckworth pass and across Sierra valley, the most productive region in Eastern California. It will run through a good country all the way to Quincy. It is about equally divided between agriculture and mining, and will give a large freight and passenger business to the road.

THE Benton, Montana, *Record* says: It has recently come to light that some 17 Nez Perces were massacred by the Sioux, under Sitting Bull, in the north, a month or six weeks ago. It will be remembered that after the surrender of the Nez Perces to Gen. Miles in the Bear Paw mountains, in 1877, that a fragment of the band escaped, fled across the boundary line and associated themselves with Sitting Bull's band. These massacred Nez Perces were the remnant of those fugitives.

Mining and Scientific Press.

THE MINING AND SCIENTIFIC PRESS is the leading mining journal in America, and enjoys a larger circulation among the more intelligent operators and workers in the gold fields of the world.

Established in 1860, it has firmly maintained its position as a reliable, standard journal. The information given in its columns has saved millions of dollars to the practical miners, metallurgists, millman, mine and shareholders on the Western side of our continent.

Among its contributors are the ablest and most experienced mining engineers, superintendents and practical miners in this country.

The PRESS gives a condensed summary of Mining Summary from the most important mining districts of the country.

New processes and methods of mining are described in weekly issues. New mining machinery and improvements are frequently illustrated and explained in a manner to be of great value to all interested in mining.

As a scientific and mechanical representative of the Pacific coast it is decidedly popular, and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivalled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer, will find profit by its reading.

Subscription, $4 a year in advance. Sample copies, postpaid, 10 cents.

DEWEY & CO., Publishers.
No. 202 Sansome St., San Francisco, Cal.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. F. OSBORNE—San Francisco.
G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Yuba and Sutter counties.
D. W. KELLEHER—San Mateo and Santa Clara counties.
C. E. WETMORE—Alameda county.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct or if the paper should ever come beyond the time desired), be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F.D., at this office.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We will send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavillon has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

THE State Mining Bureau, No. 313 Pine street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

ANNUAL STATISTICIAN of 1881.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 316 California st. Price, $4.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

REGULAR DIVIDEND NOTICE.

OFFICE OF THE

Northern Belle Mill and Mining Company,

SAN FRANCISCO, AUGUST 10, 1881.

At a meeting of the Board of Directors of the above named Company, held this day, a Dividend (No. 50), of Fifty (50) Cents per share was declared, payable on Monday, August fifteenth (15), 1881. Transfer books closed on Thursday, August eleventh (11), 1881, at 3 o'clock P. M.

WM. WILLIS, Sec'y.

Office—Room No. 29, Nevada Block, No. 300 Montgomery street, San Francisco, Cal.

EXTRA DIVIDEND NOTICE.

OFFICE OF THE

Northern Belle Mill and Mining Company,

SAN FRANCISCO, AUGUST 10, 1881.

At a meeting of the Board of Directors of the above-named Company, held this day, an Extra Dividend (No 51), of Twenty-five (25) Cents per share was declared, payable on Monday, August fifteenth (15), 1881. Transfer books closed on Thursday, August eleventh (11), 1881, at 3 o'clock P. M.

WM. WILLIS, Sec'y.

Office—Room No. 29, Nevada Block, No. 300 Montgomery street, San Francisco, Cal.

Steep Hollow Gold Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Liberty Hill Mining District, Nevada County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 6) levied on the 21st day of June, 1881, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Cert.	No. shares.	Amt.
Jos. Clark	3	50	$75 00
E. A. Richardson, Trustee	25	100	150 00
E. A. Richardson, Trustee	26	100	150 00
E. A. Richardson, Trustee	27	50	75 00
E. E. Dewey, Trustee	50	500	750 00
J. W. Pew, Trustee	55	2250	3375 00

And in accordance with law, and an order of the Board of Directors, made on the 21st day of June, 1881, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the auction rooms of Jno. Middleton & Son, No. 116 Montgomery street, San Francisco, California, on Thursday, the 18th day of August, 1881, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

J. W. PEW, Secretary.

Office, 310 Pine street, room 15, San Francisco, Cal.

DIVIDEND NOTICE.

OFFICE OF THE

Eureka Consolidated Mining Company,

Nevada Block, Room 37, San Francisco, Aug. 15, 1881.

At a meeting of the Board of Directors of the above named Company, held this day, a dividend (No. 70) of Fifty (50) Cents per share was declared, payable on Saturday, August Twenty-seventh (27), 1881. Transfer books closed until the Twenty-ninth (29) inst.

W. W. TRAYLOR, Sec'y.

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending this date, the Board of Directors of The German Savings and Loan Society has declared a dividend on Term Deposits at the rate of five and one-tenth (5 1-10) per cent per annum, and on ordinary Deposits at the rate of four and one-fourth (4¼) per cent. per annum, free from Federal Taxes, and payable on and after the 11th day July, 1881. By order, GEO. LETTE, Secretary.

San Francisco, June 30, 1881.

DIVIDEND NOTICE.

OFFICE OF THE

Silver King Mining Company,

SAN FRANCISCO, AUGUST 9, 1881.

At a meeting of the Board of Directors of the above named Company, held this day, a dividend, number twenty (20), of twenty-five (25) Cents per share was declared, payable on Monday, August fifteenth (15), 1881, at the office of the Company, Room 19, No. 328 Montgomery street, San Francisco, California. Transfer books closed on August tenth (10), 1881, at 3 P. M.

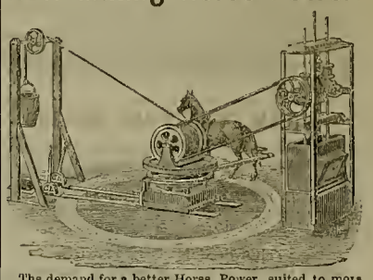
MINERS' HORSE-POWER.

One Horse can easily hoist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX,

49 Fremont St., S. F.

New Mining Horse Power.



The demand for a better Horse Power, suited to more general use, has resulted after much experience in the above machine, which we can recommend as a First-class Hoisting Power, under complete control of man tending bucket, through levers connecting with brake and clutch.

This power is light and strong, so that two or more horses can be used for crushing ore or other work.

Excelsior Blasting Powder,

—MANUFACTURED BY—

THE EXCELSIOR POWDER COMPANY.

This is no NEW PATENT NON-EXPLOSIVE SAFETY POWDER, but the GENUINE STANDARD ARTICLE, and as safe to use and handle as any Nitro-Glycerine Powder manufactured. The Fumes and Gases, common in other Nitro-Glycerine Powders, are almost destroyed, and do not leave the miner with headache or nausea. Among the numerous recent testimonials the following is but a fair sample, constantly received, attesting the superiority of EXCELSIOR POWDER:

AUBURN, Cal., May 26, 1881.—EXCELSIOR POWDER CO.: I send you, per Wells, Fargo & Co., a box containing samples of country rock through which I am running our tunnel on the Conrad Mine, and through which we have now run 425 feet, 2/5 feet of it having been done with EXCELSIOR POWDER. If any one can produce harder rock I would like to see it. I here say that I can do more execution with your No. 2 Powder in this rock than I can with any No. 1 Powder of any manufacture I have ever used, and I have used every kind now manufactured here, excepting "Tonite," and I have had 20 years' experience in blasting. Respectfully yours,

E. W. ROBERTS, Superintendent.

Give this Powder a trial and you will use no other. For Strength and freedom from noxious fumes, it has no equal. Address all orders to EXCELSIOR POWDER CO., No. 330 Pine Street, Rooms 53 and 54, Academy Building, San Francisco, Cal.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

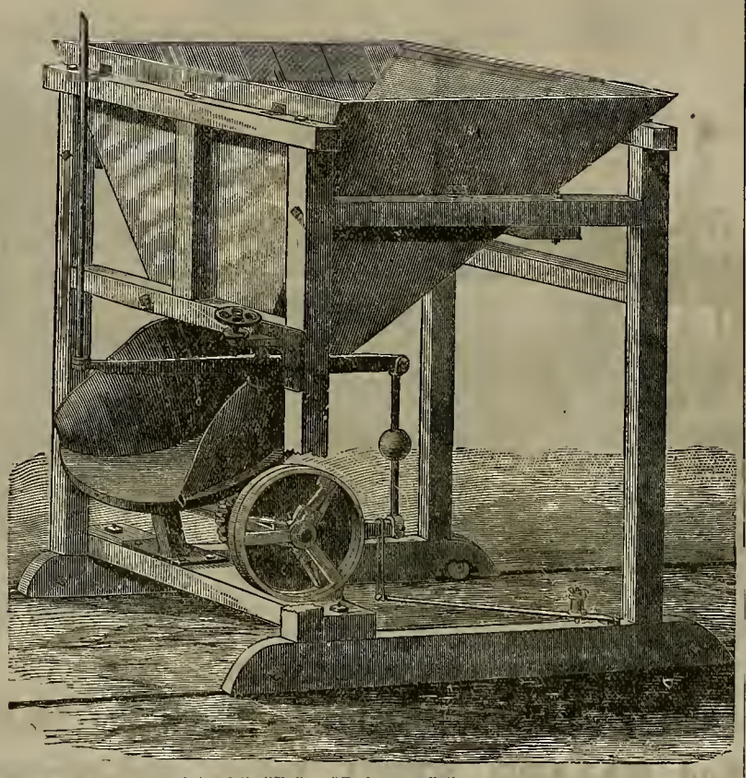
OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Induetrial Faire of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight heretofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking-table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.



The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King," Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

Mr. H. W. GREENWELL, of the Tingman Mine, El Dorado Co., or any other person can make $1,000 by disproving the acknowledged superiority of my "CHALLENGE" Feeder, in a competitive trial, side by side, with any other Feeder, on wet or sticky ores from any mine, and I will give $100 to any one who will procure the acceptance of this challenge, and arrange for a fair and impartial test on merit.

I mean business, Gentlemen, "either put up or shut up."

JOSHUA HENDY,

Manufacturer of all descriptions of Quartz and Saw Mill Machinery. A Large Stock of both New and Second Hand at Machine Worke. Noe. 49 and 51 Fremont Street, San Francieco.

VOLUME XLIII Number 9

Pan Amalgamation.

To promote amalgamation it is the general custom to add to the charge in silver mills, either at or soon after the beginning of the grinding, or at the time of supplying the quicksilver, various materials generally described as "chemicals," and usually consisting at present of sulphate of copper and salt.

Since the first introduction of the pan process a great variety of substances supposed to effect the decomposition of the silver sulphurets and to facilitate amalgamation, have been suggested by what J. D. Hague calls "process vendors," and employed by men possessing little or no knowledge of the science of chemistry. Even tobacco juice, decoction of sego brush, and various other equally absurd ingredients are said to have been used by some operators in the earlier days of the Comstock, and believed to be effective reagents in the decomposition of the ore and amalgamation of the silver. We can easily see how this could be done, remembering that even at this late day things equally absurd are practiced; and the same absurdities repeated time and time again.

The long list of materials in use has now been reduced, excepting in a few places, to sulphate of copper and salt. The quantity used varies from a quarter or half a pound to three or four pounds to each charge of ore, the two substances being employed in very variable proportions in different mills. The action of these, however, which is generally supposed to be analogous to that produced by the same reagents on the Mexican patio process, is not very clearly understood. This is apparent from the fact that in some mills, both the sulphate of copper and salt are used; in others, only the first is used without the second; and in others, only second without the first, or, if at all, in proportions so minute, that its efficient action is incredible; others dispensed with the use of "chemicals" altogether; and under all these varying results, about the same average results have been obtained.

Mr. Hague, who investigated this subject pretty thoroughly, made the statement some years since, that some mills accustomed to use both salt and sulphate of copper, dropped either one or the other while working on the same class of ore without perceiving any difference in the result.

The mining town of Jesus Maria is situated in the State of Chihuahua, Mexico, in the very heart of the Sierra Madre mountains, distant about 300 miles due east of the port of Guaymas, 200 miles northeast of the city of Alamos, State of Sonora, and 300 miles westerly of the city of Chihuahua. It contained at one time 14,000 inhabitants, whose sole occupation was mining. Fourteen years ago the town was destroyed by fire, and up to within the past year but little was done to rebuild it, as but few of the inhabitants have been able to recover from the effects of that calamity. At present there are about 1,500 inhabitants, and the population is increasing, as English and American capital are erecting extensive works, and in a very few months Jesus Maria will again be yielding its treasures of gold and silver as of old. The mineral belt is large, and within a radius of 15 miles of the town the records show 550 locations or mining claims, all of which have been worked more or less extensively for the last 35 years. Over a dozen mines have yielded immense bonanzas from surface down. The Santa Julian mine yielded $52,000,000, the work being done in the crudest manner and under the greatest disadvantages.

Some bars of silver bullion, sent by Wells, Fargo & Co's. express, were unloaded from the stage at the depot at Benson, Arizona, the other evening, and while the messenger was taking them from the platform into the office, being absent but a few seconds at a time, some person or persons got away with one of the bars, valued at $2,000, and which must have weighed at least 125 lbs., and no trace of it has been discovered.

Railroad building is difficult and costly in the Temecula canyon, San Diego. The *Union* says: The roadbed is located from 4 to 25 ft. above the creek, and in a few places the grade

THE VICTOR ROCK DRILL

is very heavy—145 ft. to the mile—which will necessitate the assistance of an extra locomotive. Much of the way the roadbed is to be formed

WILBRAHAM ROTARY PUMP WITH ENGINE.

by just enough cutting on one side to make the fills. Estimates were given us from which we infer that about one-fourth of the rock which is to make the roadbed must be removed by blasting. Some idea of the cost of construction of this seven miles may be had when we say it is estimated that it will require $80,000 worth of powder to do the necessary blasting, and we think $45,000 a mile, a very low estimate for this portion of the work.

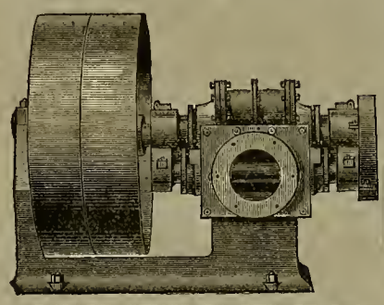
The Humboldt (Nevada) sulphur works ship 180 tons of sulphur a month.

Victor Rock Drill.

Parke & Lacy have at their mining machinery depot, Fremont St., one of the Victor rock drills set up for trial. This rock drill we illustrate on this page.

This machine is so simple in its construction that by a few minutes' observation, any person may fully understand how to operate it. It has all the adjustability required to adapt it to uneven surfaces and can be operated upon a space 16 inches square.

The double gauge bit which is used with this machine is superior to the ordinary single bit. It is less liable to break. It always bores round, straight smooth holes. In consequence of the peculiar shape of this novel bit, any size hole



ROTARY PUMPS TO RUN BY BELT.

can be drilled with one and the same machine, from half an inch up to six inches in diameter, and any bit from one and a half inches in diameter will drill holes from 1 to 10 ft. in depth without requiring any change of bits. This machine is self-feeding and self-cleaning. It is run either by hand or steam, as persons may desire. It weighs 350 lbs., and can readily be moved by one person in less than one minute, by laying it down and running it upon its own wheels, like a cart from place to place in a quarry. This machine has recently been greatly simplified, improved and strengthened. It is made of the best cast steel and iron. The engraving is so plain that anyone can see how the drill is operated.

The Wilbraham Rotary Pumps.

We illustrate on this page the Wilbraham rotary piston pump, one of which is exhibited in the fair by Joshua Hendy, agent for this coast. The pump is made on the same general principle as the well-known Baker blower, and it is claimed that the ordinary objections to this class of pumps have been overcome in this. The pumps work equally well run in either way. It will pump hot or cold liquids, delivering a steady and uniform stream, and works under either high or low pressure. It is positive in its action in both lifting and forcing. It has no irregular shape or sliding movements, all working parts being true circles. The larger engraving shows the pump with engine attached. The smaller one shows it arranged to run by belt. This pump has only lately been introduced on this coast, though well known in the East.

Foundry Notes.

The Fulton foundry (Hinckley, Spiers and Hayes), is in common with most of the other large iron works of the city, very busy just now. They are making a specialty of the Corliss engine, of which pattern they are making quite a number. They have just completed a large 400 horse-power engine for the Pioneer Woolen Mills of this city. This is a Corliss cut-off, with cylinder 30-inch bore, and 60-inch stroke. It works perfectly. On the trial, the first day it ran, there was only a difference of half a revolution a minute when running without a load, or with all the ponderous machinery of the mill, suddenly started. This remarkable performance shows the perfection of the mechanism both in design and construction, and the builders are to be congratulated on the result.

Another one of these engines, with cylinder 18-inch bore by 48-inch stroke, has just been completed for the American Sugar Refinery of this city. They have nearly completed two of these engines, each 18-inch bore by 36-inch stroke, for the Presidio Railroad Co., the new cable road.

Some little marine work is also being done. They have just completed a little iron steamer for Ecuador, 49 ft. long, 12 ft. beam and 8 ft. deep. She is to run on a river there to transport gum for private parties. The boiler is horizontal, and the engine is a 10x12 high pressure. Have also completed two double engines, 10x12, and boiler, for the Health Officer's new steam launch, *Geo. C. Perkins*. Are now putting into a new freighting schooner auxiliary steam power. Among other jobs now in the shop is a 150-horse power engine, Myers' cut-off, for a mine in Montana; a 10-stamp mill with pans, settlers, retorts, etc., for the Bradshaw Co., Tombstone, Arizona; three sets of boisting works for as many different mines; five air compressors, etc. They are also doing a good deal of repair work on the iron steamer *Barnard Castle*, now in the dry dock.

An excellent sample of the work of this firm may be seen in the fine engine which supplies the power for all the machinery in the fair building. It has been in use several years, and has performed its duties very satisfactorily in every way.

At the Ætna Iron Works they have just turned out a 40 stamp mill, two furnaces and dryers for the Highland Chief mine, Lewis district, Nevada. The firm has in process of manufacture three O'Hara furnaces, a 12x24 engine and boiler for Knox's woolen mill, Fifth street, a ten-stamp mill, to be provided with furnaces and everything necessary, and to be set up in running order at the Tahoma mine, Atlanta, Idaho. The owners of the Tahoma are Pennsylvania capitalists. Then there is a large lot of 12-ft. pulleys and 10-inch shafting in process of manufacture for Beckett & McDowell, of New York. The Ætna people have lately sent a 40-stamp mill to the Providence mine, Nevada City.

The ore streak found in the south header of Sutro tunnel, in Yellow Jacket ground has been prospected a distance of 15 ft. from the drift. It maintains its width, and is said to have a better appearance. No assays have been taken since it was found. The foregoing we take from the Virginia *Chronicle*. There is a conflict of testimony somewhere. One of the Comstock papers recently stated that the ore was sulphuret in true Cometock quartz, assaying from a trace up to $300 per ton.

The New District.—The excitement at Palisade over the mining discovery in that neighborhood is unabated. A private letter from the Eureka *Sentinel* that Howland & O'Brien purchased a half interest in the Onondago for $50,000. It has been published that they merely bonded it. A number of strangers and experts went out to the mines, seeking locations. The new camp seems to be attracting a great deal of attention.

Tearing down the old smelting works at the Geddes & Bertrand mine, Eureka, Nev., has been commenced, to make room for the 40-stamp mill to be immediately erected.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

San Diego Mines.

Editors Press:—I have besn down the coast to San Disgo county hunting mines for a party, and stopped two weeks in the Pinacarte district, 30 miles south of hsre. I found some small mines, owned chiefly by Mexicans. Arastras are used extensively. One mine, whicb was divided and the north end sold to John Larocbe, called the San Jacinto, is now down 107 ft. The decomposed white quartz pays from $30 to $100 per ton. Thsy are now working a vertical shaft near the junction with the otber mins on the same lode. Thsy will soon put up a five-stamp mill with 600-lbs. stamps, pan and 20 horss-power engine. The gold is exceedingly fine, and nothing would work it hettsr than Paul's pan.

There is every prospect of the Julian mines starting up again. The Providence Mountain mine, located hy Andrew Macfarlane, and which he sold to a mercbant of this town and to Ahern & Co. some time ago for $300, has now men at work on it. Ths Waterman mine, in Mohave, is a fine property, and hig pricss have been offsred for it.

The district is evidently way up for miners. Mr. Waterman believes he has a mine now. His brothsr is huilding for him a mill, which was formerly owned hy the Miueatta Belle, of Panamint valley.

A party are going out on a general tour for miners to prospect towards the Colorado. Look out for big strikes. When I return from the trip, I will let you know the result as well as a practical opinion of snch properties as I may see on my rounds. Old Prospector.

San Bernardino, Aug. 11, 1881.

First Gold in California.

General Sherman has given this account of the first discovery of gold in California: "I remember one day that two men, Americans, came into the office and inquired for the Governor. I asked their husiness, and one answered that they had just come down from Captain Sutter on special business, and they wanted to see Governor Mason in person. I took them into the Colonel, and left them together. After some time the Colonel came to his door and called me. I went in, and my attention was directed to a series of papers unfolded on the tahle, on which lay ahout half an ounce of placer gold. Mason said to me, "What is that?" I touched it and asked, "Is it gold?" Mason asked me if I had ever seen native gold. I answercd that in 1844 I was in Upper Georgia, and there saw some native gold, hut that it was much finer than this, and that it was in phials or transparent quills; but I said if this were gold it could be easily tested—first by its malleahility, and next hy acids. I took a piece in my teeth, and the metallic luster was perfect. I then called to the clerk (Baden) to bring an axe and hatchet from the hack yard. When they were brought, I took the largest piece and heat it flat, and beyond donht it was metal, and a pure metal. Still, we attached no importance to the fact, for gold was known to exist at San Fernando and yet was not considered of mnch importance."—*Ex.*

New Mill at Sawtooth.

The Wood River *Times* says: Mr. Cortright, Secretary of the Colnmhia, Beaver, and Lncky Boy mining companies, of Sawtooth, spent fonr days in Hailey last week, endeavoring to secure 35 or 40 carpenters to work on the two mills which are being erected over the range for the companies named. About 80 men were at work already, hut Mr. Cortright said that his companies wanted to crowd two seasons work into one, if possible.

The quartz mill and appurtenances are intended for 20 stamps, working abont 60 tons of ore per day. Only 10 stamps were ordered, however, as the mine managers preferred to go a little slow this year. But more ore having been struck recently, it was deemed hest to make the contemplated addition to the capacity of the mill at once, and Mr. Brewster, President of the three companies named, left for San Francisco last Friday to proonre tbe other ten stamps. They will probahly he shipped within 30 days, and be in position hy the 10th of October. The mill was mannfactured at the Pacific Iron Works, in San Francisco, and James E. Owsns, who is said to he the hest constructing engineer on the coast, will superintend its erection. It will be started up on ore assaying from $35 to $65 in gold and ahont $600 in silver. It is expected that hy the first of Octoher tbe earnings will admit of the first monthly dividend being declared.

The grading of the experimental mile of the Grangeville and Antioch road has heen commenced from Hanford. The first furrow was plowed hy J. A. Hill, who sowed the first wheat in the Mussel Slough conntry.

The Harbor at Wilmington presents a lively appearance. There are 14 vessels either lying in the harbor or anchored outside.

Subterranean Heat.

Statistice of Interest to Scientiete.

Following are the temperatures of the ground in the Forman shaft, from the surfacs to the depth of 2,100 ft., as ascertained by drilling holes not less than three ft. dsep into the rock, and inserting a Negretti & Zambra slow-acting thermometsr (of the pattern adopted hy the Undsrground Temperature Committee of ths British Association, and standardized at Kent) into the hols, closing the hole with clay and lsaving the thermometer for 12 hours—not less than three holes being tried at each point:

Depth.	Temperature.
100 feet	50½ degrees.
200 "	55 "
300 "	62 "
400 "	60 "
500 "	68 "
600 "	71½ "
700 "	74½ "
800 "	76½ "
900 "	78 "
1,000 "	81½ "
1,100 "	84 "
1,200 "	89½ "
1,300 "	91½ "
1,400 "	96½ "
1,500 "	101 "
1,600 "	103 "
1,700 "	104½ "
1,800 "	105½ "
1,900 "	106 "
2,000 "	111 "
2,100 "	119½ "

It will he sesu by tbe ahove that, although there is on the whole a steady increase of temperature as depth is attained, the increase of temperature is not rsgular. For instance, the rock at the 400 is two degrees cooler than at the 300 level; between the 400 and 500 levels there is a diffsrsnce of eight degrees, whils in other places an additional depth of 100 ft. shows hut a slight increase in the temperatnre. Thus at the 1800 level the temperature is 105½ degrees, while at the 1900 it is hut 106 degrees, an increase of hnt one-half a degree. This difference is undoubtedly owing to the character of the rock at the points whsre the holes were made; therefore, it would he of great interest to have, in connection with the temperature, a description of the rock; not only the kind of rock, hut also the nature of the same, whether carrying much lime, gypsum or iron pyrites. It would prohahly he shown that wbere tbere was mucb lime there wonld he an inoresse of heat not warranted hy the incressed depth, and the revesse where lime was absent.—*Virginia Enterprise.*

Educating the Indians.

We had this week, an opportunity of conversing with Mr. E. Conklin, who lately arrived in this city from New Mexico, on his way East again. Mr. Conklin has heen very sncessful in his mission among the Indians, getting the full quota to take to the Government schools at Hampton, Virginia, and Carlyle, Pennsylvania.

It will he rememhered that during President Grant's administration the different Indian Territories were divided np among the religious denominations, in the matter of Indian affairs. New Mexico and Arizoua fell to the Presbyterian chnrch, and the Rev. Sheldon Jackson, D. D., is Snperintendent of Missions for the Pacific coast for that denomination.

Early last fall the Government commissioned Dr. Jackson to proceed to New Mexico and Arizona to collect a certain numher of Indians for the purpose of taking them on to the Government schools referred to. Dr. Jackson, knowing of Mr. Conklin's familiarity with and knowledge of Indian affairs, called upon him to assist in the task. He took Arizona for his field, and to Mr. Conklin was assigned New Mexico. A brief account of the method of procedure as ohtained from Mr. Conklin will be of interest.

He proceeded, with letters from the Government to the different agencies, and visited tbe different puehlos holding treaties with the nnmerous trihes of New Mexico.

The combined result of the efforts of these two gentlemen was that more Indians were collected than the commission called for, which was very rare, and a flattering circumstance for these two gentleman. Twenty-six only were taken East, several heing left hehind.

In visiting the puehlos some appreciate the advantages to he gained hy going, but will not go nevertheless. Some can see no advantage in education. Others again, who see the henefit, would like to go, bnt the ties of kinship are stronger than the desire for knowledge. It sometimes happens also that those who make up their minds to go are not allowed to do so hy their relations.

There is, of course, nothing compulsory in this matter, and the couditions nnder which the Government will take the Indians is always carefnlly explained to them. They then hold a sort of council or cancus to consider the advisahility of letting any of the trihe go. Some of the chiefs, however, are so opposed to treating with the Government that they will not even permit a council to be called. In some pnehlos they will he pleased and agreeahle, which in others they will have nothing whatever to say or do with any Government official. One great trouble Mr. Conklin found was his necessity of refusing a great nnmher from any one trihe. That is, two or three wonld signify a willingness to go, and then a dozen more would want to. They heing denied, the first ones would decline, nnless all went. In consequence, none would go from this tribe.

Among tbese Puehlo Indians, altbough they are all the same, each tribe spsaks a diffsrsnt language. In one locality Mr. Conklin found in 75 miles, five Pueblos, the Indians of no one of which could understand those of the otbers. This is between Albuqnerqne and Santa Fe. The languags vary all over ths Territory. In nne of the carloads taken none of the Indians nnderstood each othsr at all.

These Indians are taken to he schooled for three years and tben returned to their peopls again, the whole, of course, at tbe cost of the Govsrnment. They are now huilding a large school-house in connsction with this system, which will he for girls especially. It will, thsrefore, he feasihle to bring more Indians in the future.

Mr. Conklin has had 10 years experience among the Indians, and has become proficient in agreeably dsaling with thsm.

Dr. Jackson is very popular and an expert in dealing with Indians, so that the combined lahors of these two gentlemsn have hssn crowned with success. These Puehlo Indians are peaceable, never having heen known to lift a hand against the white man. There is a heatsd controversy now going on among scisntists as to whetber they are direct descsndants of the Aztecs, or a differsnt race of people.

The Mining Regions of California.

The *Union Democrat* (Tuolumne Co.) says: The mineral region of California has produced an immense amonnt of money since mining was commenced in the Stats. The products of the minss huilt up San Francisco and other citiss, developed agricultural interests and furnishsd the mouey to improve all kinds of possessions and give the Stste great prominsnce abroad. Had there heen no mines there would now he a sparsely settled conntry in place of a great and powerful State. Singular it is, but true, that the locality producing this great wealth is to-day the poorest of any portion of the State. It is the least developed, altbough possessing some as fine agricnltural lands as can he found elsewhere. The climate is the best and healthiest that can be fonnd outdoors, yet it has heen made trihutary to the great centers and to the larger chauces for speculation in the lands of the valley. If bnt a moiety of the gold taken out of the ground, had been retained in the mining foothills, to develop their resources for prodncts of the eartb, and the establishment of industries, they to-day would be the most valnable and most songht for portions of the Stato. History of the mining connties all show, nnfortunately, that wbcn men bad large success in mining, they transferred their gains to San Francisco or to the valleys, leaving the land that gave them money, to languish aud go on its way in poverty. No section of country can have its suhstance taken from it and enjoy prosperity. What a nnmber gathered fortune from the mines in Tuolumne and took it all away leaving those less fortnnate to plod on as best they could. Experience bas shown that one good mine, the yield of which is devoted to the creation of property and for the puhlic good, is worth a dozen others, let them be rich as they may, when all hut the working expensss goes where it is of no more henefit to the county in which it was taken out. The mining rsgion has wealth remaining, sufficient to make it tbe richeat portion of the State, if it can he allowed to enjoy a reasonahle part of the yield of its mines. The man that works a mine and huilds a house, or establishes an indnstry, or adds to the improvements of his locality is entitled to the warm support of his neighhors. He is worth all the adventurous speculators that can come, who immediately ship away every dollar they get ahove necessary expenses for working their mines. Of course meu can come with means and work and do what they please with their profits. There is no law that can ahridge that right, yet the interest of the community cannot help heing greater for the mine owner that invests his profit at home. After so many years of constant drain, keeping the county from that prosperity it should enjoy, it would he a grand thing if our mines could get into hands that would devote a portion of their gains to improve and make more valuahle the surroundings. It is not for the want of rich resources that the mining region is less prosperous than elsewhere, it is from the fact that fast as the wealth is gathered it is pnt hsyond heing of any henefit to that region.

Chinese River Mining.—A company of Chinese miners are working in the hed of Bear river, a short distance helow the mouth of Greenhorn creek. They bave diverted the watsr in the streams by means of enhankments, so that it runs close to the Nevada side, leaving a large area of ground dry. They have sunk a large pit into this, which is compact sand and gravel, the washings from the mines, down to the original hed of the river. The depth is 16 or 18 ft, which makes heavy stripping, as all the top dirt has to he wheeled out in barrows. The pit is kept dry of the sipage water hy the nsual water-wheels used in river mining, in the erection of which the Chinese always show as much ingenuity as the white men. The Chinese are always reticent as to their snccess in mining, hut from the fact that the same company has worked that part of the river for several years in snccession, the inference is that they have paying ground.—*Grass Valley Union.*

A $40 nngget was found on Weaver creek, near Osceola, last week.

Middle Portion of the Comstock.

The Virginia *Enterprise* says: Our stock dealers and dahhlers are heginning to wake up. They havs had a long snooze. It is to he hoped a fosman worthy of their "stsal" will soon riss up. No one would object to seeing something like the stock hattles of yore. After years and years of waiting we shall now see something done in the middle mines in the way of prospecting. Thus far, siuce the draining of those mines of the ancisnt flood, the only work done has heen preparatory—the running of drifts. In the Chollar and Potosi mines a joiut drift of great length was run long ago on the 2400 level. Now that the hydraulic pump at the Chollar-Norcross-Savags shaft is working all right, this drift is heing cleaned out, preparatory to prospecting ths grouud of hoth companies.

There is in ths Potosi, also in Ohollar, a vast deal of virgin ground. From the 2400 up to the 1900 lsvel the ground is unexplored. In the Potosi is a considerahle length of grouud that is virgin from the surfacs down. All this ground is now to he opened up. In it tbers is room for half a dozsn big honanzas, and lst us hops that ore may have utilized all the space at band.

The Savage folks are now getting ready for business. On their 1300 level to the northward they have a great hrsadth of quartz containing more or less metal, and on the 1600 level the Sutro tunnel cut through a solid body of quartz over 80 ft in width. This quartz really gives assays tbat show it to hs almost, if not quite, a "milling proposition." In places ars spots of very rich ore. From one of these an assay of ovsr $2,000 was obtained. This proves not only that ths quartz is fertile but also that it is capahle of producing as rich ore as has ever heen found on the Comstock. All that is known ahout this immense body of quartz, is what is to be seen in the oue spot where the Sutro tunnel folks cut through it. No one knows what lies in the big quartz deposited 10 ft to the north or soutb of the tunnel.

The hody on the 1300 level is also unexplored at depth, hut already the water has so far receded that oxplorations may be commenced on the 2200 level.

At the Gould & Curry and Bsst & Belcher shaft they must one of these days cut into the same hig body of quartz that was passed through hy the Sutro tunuel. As it is to the west of the shaft they should not even now have far to drift in that directiou hefore cutting it.

At tbe Yellow Jacket, on the 282S level, they have an 80-ft. vein of quartz, which is shown to be metal-hearing hy the only hole that has ever yet bsen drilled iuto it. For all anyone knows to the contrary there may he paying ore at a distance of a few fest from this hole in any direction—north or south, up or down. They are now pnshing their main drift north, aud will soon again hore through this deposit and in dne time will cut it up with drifts and crosscuts.

Besides this prospect thsre is the very promisiug vein cut through hy the south hranch of the Sutro tunnel, lying out to the eastward of the shaft. This is as yet wholly unprospected. Wben cut through it was rapidly widening (at the rate of two ft. in eight) to the northward.

From tbis hasty glance it will be seen that there is much of promise lying withiu that portion of the lode bounded by the Yellow Jacket shaft on the south aud the Oshiston shaft on the north.

The Bullion Product.—Wells, Fargo & Co.'s report of the semi-annual production of preoious metals on the Pacific coast, just issusd, is as follows: Gold, $9,418,378; silver, $29,826,400. The report wns prspared hy John J. Valentine, Superiutendent of Wells, Fargo & Co.'s express, from the hooks of the company, and is authentic. This rate continued during the remainder of the year will aggregate for 1881 about $80,000,000, the largest hullion prodnction since 1874. Though the Comstock mines declare no dividends, they produce considerahle hullion, and Eureka and other outside camps in Nevada have increased their yield during the first six mouths of the year. Arizona, too, has prodnced considerable hullion this year, which has to some extent made up for the deficiency of the Comstock. The aggregate yield shows that notwithstanding the supposition that mining was on the wane, tbe amount of bullion prodnced from January to July, 1881, on this coast, is larger than it has heen for years. This will nndouhtedly encourage new enterprises, as it will attract the atteution of capital uow seeking investment in the East to the Pacific States and Territories, as it shows conclusivsly that mining is as productive to-day as it has been at any time since 1874, when the Comstock honanzas were producing millions annually.

The Paradise Mines.—A correspondent of the *Silver State*, writing from Spring City, says the mining prospect is so enconraging that several parties have gone into the husiness of jumping lots in that village. The Philadelphia gentlemeu, Messrs. Dow and Chandler, who visited the camp last week, are well pleased with what they saw. They paid all dehts that had heen incurred by the Red Dear company, in which they are interested, and set a force of men at work on Monday under the supervision of Frank Gregor. They made a thorough inspection of the mines, and concluded to huild a mill this fall, on a site selccted hy them at the north end of Spring City. Lots are consequently sought for, and cahius, chicken honses, etc., are being moved on favorable locations, to hold them.

MECHANICAL PROGRESS.

Cutting-Tools and their Uses.

A correspondent to the mechanical department of the Boston *Journal of Commerce* gives the following interesting and instructing *resume* in regard to the use and action of cutting-tools:

"Cutting," as generally understood, is illustrated in the cutting of bread by a bread knife, the slicing of meat by a carving knife, the whittling of wood by a pocket knife, and other handy methods of using the knife, razor and similar implements. All these methods depend upon their utility by drawing the cutting edge over the substance, and not merely separating fibers by breaking them or cutting them square across. This method of cutting is not applicable to metals, to ivory, and to other substances whose rigidity is greater than their tenacity, nor to those whose compactness is greater than their porosity. As instances: cast steel and cast iron are rigid and compact, while wood and baked wheat in the loaf are porous and tenacious. The one cannot be properly cut by a drawing cut, while the other cannot be readily cut by any other method.

A wedging cut is a violent disruption of the particles by blows or pressure, and consists in lifting the particles to be moved from those which are to remain. In the case of the cold chisel the particles are driven in front of the edge of the chisel by blows; in the case of the planer cutter they are pressed forward by the movement of the planer platen against a fixed cutter; and in the case of the lathe the cutter lifts the material on a rotary motion which allows the cutter to operate on an inappreciable amount of material for an almost infinitesimal period of time. So it will be noticed that while a turning tool in a lathe may be so used as to leave hardly any marks of its progress, a similar tool on a planer shows its progress, and leaves its results not only visible but in actual ridges.

The separating of parts of a substance by shearing—one cutter operating against another—is not "cutting" in the proper sense of the term—it simply means that there is not space for the material to pass between two closely opposing obstacles. In the sense of edge tools, the wheels of a locomotive or of a railroad car are as much so when combined with the rail, as the two blades of a pair of scissors; so scissors can hardly be called "edge tools."

In fact there is no such thing as a positively cutting mechanical tool. The sharpest edged drawing tool, as a razor, is merely a means of separating portions of material that have already invited to a rupture by the spaces between their particles. The razor simply finds its way between them because it has a thin, wedge-like edge, and when the separation is completed, the microscope shows the ends of the separated hairs as the sheared ends of grass stalks the scythe has cut; and this cut is a shearing cut, not a positive, square, diametrical separation. Even when the heaviest, most rigid and most exact shearing machines in use in our shops and large manufactories merely cut bars to crude lengths; and if exactness is required, the bars are placed in a cutting-off lathe that gradually turns a score from circumference to center, cutting its way by means of a fixed chisel against the rotation of the shaft, or bar. All this slant or "shear," as mechanically called, is occasioned by the resistance by the material to the intruding cutter, and in no case does it allow the cutter to pass without presenting the obstacles of its matter.

With the best, most closely geared, and rigid planer it is impossible to produce an equable, smooth surface, even with the finest feed. In fact, it is impossible to produce a surface that does not show the "planer marks" to the naked eye. The best finished planed surfaces of the finest gray cast iron or low steel, must be scraped to surface to *have* a surface. Between every ridge of the finishing cut of the square-nose tool of the planer shows a dark gray furrow, in plain distinction to the polished ridge. Under the microscope, the polished ridge is a burnished ridge, the disturbed and serrated particles being erect or bent, but crowded by the passage of the non-cutting portion of the tool, while every longitudinal depression shows the particles of the disturbed metal standing up like the horrified bristles of the annoyed porcupine. To produce an even surface, hand manipulation is brought into action by scraping, which more gently removes the superabundant surface, and allows us to claim, in our coarse mechanical way, a "true surface." But even this is only an approach to absolute perfection; yet scraping is nearer actual cutting of the metal than the best preliminary of the planer.

Probably the lathe gives the best first results of cutting metals. With a fine feed and broad-nosed tool we can get a very good surface requiring but little abrasion to bring ridges down and depressions up to a general surface. And even in this case all the after finish is but a repetition of the former action. Whether the material used as a tool or an abrasive substance, the action is merely a cutting away of the superabundant material.

Burnishing or metals simply means returning to its place the disturbed particles, but even that does not close up perfectly the gaps left by the removal of portions of the material. In short, there is no absolute cutting of materials. The best we can do by our best mechanical means is to remove unnecessary material and make the disturbed surface conform, in some approximate degree, to a fixed gauge, or to some other surface it is intended it should fit.

Cutting implements, whether edge tools or other appliances, are merely means of separating rejected from useful portions of material, and do not reach the particles of the material itself. We can give no perfect surface to material simply by removing a portion. We may reduce in size, and make fits, but the best surface given by mechanical means is a depression of torn or ruptured surface by burnishing, or the mechanical-chemical action of friction and heat, as shown in the interior of a steam cylinder or on the face of a steam valve.

Belting Material.

There can be but little doubt in the minds of observing mechanics that we are on the eve of a revolution in the selection of material for belting. Leather has already been largely superseded by rubber, but the latter also fails to give the full satisfaction desired. Cotton is coming largely into use in Europe. In regard to this material Kirkaldy, of London, whose test works are known throughout Europe, has shown that an 8-ply cotton belt is capable of sustaining nearly double the breaking strain of the best six-inch double leather belt, whilst it is little more than half the cost. Cotton belting is now in use in some 10,000 mills abroad; the demand is at present larger than the supply. So many annoyances attach to leather belting, that its supercession by a more durable material, possessing all the requisite elasticity without any tendency to give will be a matter of general congratulation.

It is furthermore reported in *Engineering* that *paper* belting is successfully used in the machinery hall of an exhibition recently held in Japan. The Japanese have long been celebrated for their manufacture of some exceedingly tough descriptions of paper, and it is stated that the paper belting has been tested and found much stronger than ordinary leather. Now that machinery is rapidly making its way into Japan, the manufacture of this paper belting is of special interest to this country, as from the want of proper tanning good leather is not made by the Japanese.

CARBON IN STEEL.—Prof. Leeds has found that the amount of carbon in a piece of steel which had been purposely burned was the same as in a similar piece which had not been burned; the burning, however, was of the steel itself, which contained a large amount of the oxide of iron; that is, the metal, instead of the carbon, burned. The heat, he says, does not harm steel or iron, and consequently they may be heated and cooled an unlimited number of times, provided they are not brought in contact with the air and so take up oxygen. In heating a piece of steel, the amount of blast has more to do with the burning than the heat; and if the extra amount of oxygen which a burnt piece of steel has taken up is taken out of it, it can be made to work just as well as it did before. The proof that the heat does not harm the steel is found in the fact that if the steel is put in a closed box, and luted up so as to keep out the air, it can be heated and cooled an unlimited number of times without injury.

A MECHANICAL COTTON PICKER.—This new invention, the appearance of which has for some time been foreshadowed—the combination cotton picker, with fingers of iron—will no doubt work a revolution in cotton-growing. It will, it is claimed, make a reduction in the price of growing of two cents per lb. The machine, by means of heaters and fans, takes the fiber from the boll, removes the seeds and all impurities, finally delivering it straightened and ready for the bale. Efforts are making to develop the machine in time for the exhibition at Atlanta.

NOTE.—If iron is placed in a furnace and completely covered with soot, the temperature then raised to a red or white heat, and continued for 15 or 30 minutes, or longer, according to the mass of iron to be operated upon, and then removed from the furnace and allowed to cool, the surface will be found thoroughly cleansed and covered with a coating which is impervious to rust under ordinary circumstances.

A FOUR-CYLINDER ENGINE.—An experiment is being made on the Providence railroad of an engine with four cylinders, double the usual number, the advantage claimed being increased speed, with less danger of leaving the track, and a much steadier motion while running.

NEW VARIETY OF COAL.—The *Jahrbuch fur Mineralogie* says that a new variety of coal, said to be the most highly carbonized member of the coal series hitherto described, has been found near Schunga, on the western shore of Lake Onega. It contains about 91% of carbon, 7% or 8% water and 1% ash; it is extremely hard and dense, has an adamantine lueter, is a good conductor of electricity, and has a high specific heat—0.1922. Although containing as much carbon as the best graphites from Ceylon, it is not a true graphite, inasmuch as it is not oxidized by potassium chlorate and nitric acid, but behaves toward those reagents like an amorphous coal.

The *Textile Colonist* suggests that novel and striking effects might be produced in tissue printing by means of Balmain's luminous paints.

SCIENTIFIC PROGRESS.

Prof. Winchell on Evolution.

In a recent lecture before the Summer School of Christian Philosophy, at Greenwood Lake, Prof. Alexander Winchell, of the University of Michigan, discussed the speculative consequences of evolution. Speaking of the predicament of those who state all religious truth on an allegation of the untruth of evolution, in case the method of nature is finally found to be a method of evolution, he said:

"At this moment the well-nigh unanimous verdict of the scientific world sustains the doctrine of evolution. This verdict is one of the criteria of truth. Repudiation of it is a hazard which only rashness and ignorance will incur. To stake all religious belief on such repudiation is to throw all of man's spiritual interests upon the hazard to die. As I understand it, the recognition of a method of evolution in nature's operations does not involve consequences deleterious to a spiritual faith, but is a means, on the contrary, for approaching into closer relations with the immaterial forces of the Divine government of the world. We must first establish a clear conception of evolution. Multitudes of men imagine evolution and Darwinism to be synonymous terms, if they do not even believe them synonymous with materialism as is so often charged. I conceive the evolution which I discover in nature to be the progressive differentiation of an identical existence. It proceeds from the more general to the more special, from the homogeneous to the heterogeneous. It means that new forms of existence are only older existences transformed and not new beginnings of existence. Every department of the cosmos has had a history, and every present is the outcome of a past. It takes no cognizance of special originations, but only of the history which follows. Evolution, I say, knows nothing of creation. This is not because it contravenes creation, but simply because creation is an event which does not come within its purview. Evolution is the name of a mode of continuance, not of a mode of beginning. It can neither affirm nor deny any mode of origin."

OZONE.—Em. Schoene calls attention to the fact that, since the existence of hydrogen superoxide in the air has been demonstrated, the occurrence of ozone as a constituent of the atmosphere has become very doubtful. Most of the reactions formerly relied upon for the detection of ozone are also produced by hydrogen superoxide. The latter liberates iodine from the iodides and oxidizes thallous compounds. It does not oxidize manganous salts, but such oxidation cannot be regarded as an evidence of the presence of ozone, since ordinary oxygen in the presence of carbonate of ammonium—which is always to be found in the air—will effect it. The tarnishing of silver may be, and probably always is, due to the presence of sulphides. The odor sometimes observed and ascribed to ozone is at best a questionable argument for its presence. Most observers would be liable to confound the odors of ozone and hyponitric acid. Moreover, ozone is not produced by the electric spark in a mixture of oxygen and nitrogen, but only oxide of nitrogen, hence the fact of visible electric discharges in the air is no evidence of its formation. It is produced by the silent discharge, but of this, as an atmospheric phenomenon, we still know too little to justify us in regarding it as a probable source of supply.

MUSCULAR ACTIVITY AND THE DECOMPOSITION OF MATTER.—The requirements of an organism for the exertion of energy can become a cause of the decomposition of the components of the nutriment and of the body. Non-azotized materials are first attacked, and if such are insufficient or have been consumed, a decomposition of the organized albumen takes place. This decomposition of the albumen of the body can only be arrested by an increase of food, especially of its non-nitrogenous portion. Even a very abundant supply of albumen cannot prevent the destruction of organized albumen if the total quantity of nourishment is not sufficient for the requirements of the force to be exerted. It is possible and probable, that in consequence of the increased demand for oxygen during work, a larger quantity of circulating albumen is necessary than the minimum required by the organism when at rest.—*Dr. O. Kellner.*

ANOTHER PREHISTORIC MAN.—Some human remains, evidently of great antiquity, says the *Academy*, were discovered a few months ago at Carahacel, near Nice, and have been reported upon by a local scientific committee, as well as examined by M. de Quatrefages. The bones had not been artificially interred, but were found embedded in a deposit of calcareous clay, at a depth of about nine ft. from the surface. This deposit was irregularly stratified, and contained a mixture of pliocene and eocene shells, showing that it had been formed by the reconstruction of the pre-existing strata. Of the bones the most remarkable is the lower jaw. This is sufficiently characteristic to enable De Quatrefages to refer it to the Cro-Magnon type. The fossil man of Nice, therefore, belongs to the same race as M. Riviere's skeleton from Mentone, both being probably of Paleolithic age.

Water and its Impurities.

Water, which consists, in its purity, of one atom of oxygen combined with two atoms of hydrogen, is never found pure except in the chemical laboratory. Pure water exerts a solvent action upon many gases and solids, and whenever it is exposed, as in nature, it always takes into its embrace something foreign to itself, and as a general thing, especially in the case of surface water, something deleterious to its use for drinking purposes.

Still, absolutely pure water is decidedly unpleasant and insipid to the taste; in fact, it is quite unfit to be taken into the system. The sparkling and refreshing effect of spring water as a beverage is chiefly due to the presence of carbonic acid gas. Free oxygen probably exists, to a very small extent, in spring water. A person may descend in a diving bell and remain for 24 hours or more under water, without any communication with the atmosphere, if he is simply provided with the means of throwing a spray of water through the atmosphere of the bell two or three times each hour. The spray absorbs and thus removes the carbonic acid, which results from breathing, and at the same time liberates sufficient pure air to take the place of that which has been vitiated and removed as carbonic acid. No doubt a small quantity of free oxygen is also liberated from the spray and passes into the lungs, either as oxygen or ozone.

The presence of certain dissolved gases in water and some minerals are in every way beneficial, while the presence of others is decidedly hurtful and often exceedingly dangerous. Oxygen, either free or in its various combinations with other substances than hydrogen, exerts an important influence in the solution and removal from water of organic matter impurities; but at the same time those solvent qualities often take up and hold in solution solids which are highly deleterious—such, for instance, as lead, etc.

Too much care cannot be taken in a thorough examination of the water we use as a beverage. Though we do not and ought not to drink pure water, we should know for a certainty what impurities we are taking into the stomach. Such knowledge is too seldom acquired, but it would be greatly to our advantage if more effort was made for a knowledge that would lead us "to wonder at the wisdom which works through intricate and complicated labyrinths to a perfect and simple end, and to admire the ultimate tendency and result of even such seeming anomalies as the 'impurities of water.'"

CAUSE OF REDDENING OF CARBOLIC ACID.—It has often been noticed that commercial carbolic acid generally assumes a reddish color. Different specimens differ in their degree of colorization. Careful experiments have shown that this color is due to the presence of copper. This color is especially manifested if ammonia be added to the solution. When the colorization is hastened by adding ammonia, it is of a darker red than without the ammonia. The presence of copper is supposed to arise from the traces of that metal found in the coating of the tinned iron vessels in which the acid is generally put up for the market. Now, will some one tell us why a solution of salycilicate of soda so frequently turns dark on exposure to light in a glass vessel. We have frequently known it to assume almost the color of ink after an exposure of a week or two. Then again, we have known it to retain its original color with only the merest shade of turning for months. In the cases referred, the samples have been obtained from different druggists.

PARASITIC WORMS.—Mr. Frederick W. True, of the Smithsonian Institute, a rising young student who has taken up the little known subject of intestinal and other parasitic worms, has lately endeared himself to the Ichthyophagous Club by his statement, in *Forest and Stream*, that fishes are more or less populous with these tenants. The salmon has 16 different kinds; the pike at least 20, and the carp so many as a dozen in its native waters. None, of them, however, resemble trichinæ "except as a garter-snake resembles a copperhead;" and they are as harmless when eaten as worms in cherries, being out of their element in the stomach of the warm-blooded human. Mr. True, wishing to follow up the useful if not pleasing investigation, invites anglers and sportsman generally to advance the study of American helminthology by preserving in spirits and sending to him at Washington, D. C., any specimens of parasitic worms which they find in game, fish and other animals.

THE ASTRONOMER ROYAL.—It is reported that Sir Geo. Airy is about to relinquish the office of Astronomer Royal, which he has filled since 1835 with so much honor to himself and advantage to the science of astronomy. He resigns his position on account of the increase of rest called for by his present state of health and advancing years. It is to be hoped that he will long enjoy the sentiment he has so well earned by the energy and devotion with which, throughout his long career, he has discharged the responsible duties of his office, to say nothing of the many improvements which his great scientific attainment and mechanical skill have enabled him to introduce into the Royal observatory.

WATER IN GEMS.—An Atlanta paper reports the recent finding, in Rauhin county, Georgia, of an amethyst bearing a drop of water or similar liquid in a cavity near the center of the stone.

Meetings and Elections.

GOLDEN FLEECE GRAVEL M. Co.—Aug. 13. Directors—O. F. Graves, Jno. O'Brien, A. Wason, D. S. Chisholm, Fr. Schirmeir.

SOUTH COMSTOCK M. Co.—Aug. 15. Directors—R. Sherwood, J. M. Buffington, F. G. J. Margeteon, H. F. Cutter, O. H. McKee. President, R. Sherwood; Secretary, J. M. Buffington.

INDEPENDENCE M. Co.—Aug. 15. Directors—A. W. Foster, F. A. Berlin, J. F. Tichenor, S B. Wakefield, E. M. Hall. President, A. W. Foster; Vice-President, F. A. Berlin; Secretary, E. M. Hall.

MACKAY & REVOLUTION M. Co.—Aug. 16. Directors—Robert Sherwood, John W. Harker, Horace Webeter, Geo. L. Bradley and W. S. McCormick. The MacKay and Revolution mine adjoins the famous Emma mine in Utah.

MINING claims have been located near the junction of Hay fork with the south fork of Trinity river in Trinity county. There is much excitement among the residents of the locality, and 30 or 40 claims, each 1,500 ft. frontage, have been located. The surface ore is said to contain gold, silver and copper.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in Mining and Scientific Press and other S. F. Journals

The Mining Share Market.

There is not very much doing in stocks just now. In fact, they are rather shaky. The hydraulic pump at the Cbollar-Norcross-Savage shaft is working splendidly. The hulkhead on tbe 2400 level of the Savsge has been opened, and all the accumulated water was pumped out in 19½ hours—all the water from other sources being handled at the same time.

The Virginia *Chronicle* says: "The reason for the steadiness of the north end stocks continues to be the main conundrum propounded for solution on the Comstock. Wby Sierra Nevada shonld be qnoted four or five times higher than the middle stocks is not understood. While the prospects for Savage, Potosi and adjacent mines, in view of the successful working of the comhination pump, are very flattering, it is strennously denied at headquarters that any promising developments have hesn made in Union, Utah, Ophir, Mexican or Sierra Nevada, which leads the market. The superintendents of the mines at the north end are nnanimous in stating that there has bsen no development in them, and they profess to be unable to acconnt for their advance in valne."

The *Enterprise* says at the Savage the prospects are now quite flattering. The water in the incline had yesterday receded 22 ft. since taking out the hnlkhead on the 2400 level. In three or four days the pnmps will he started up, and the remainder of the water taken out. It is thought that the incline may bo drained in three days. Sinking will then he resumed; also, they will commence explorations on the 2300 level, where no work has yet been done. They will now very soon begin the extraction of ore from the 80-ft. body of quartz cut by the Sutro tunnel on the 1600 level. Although it is not generally known, they have next the hanging wall a deposit of very good ore. A careful examination with a view to milling shows that the first three ft. next to the clay of the east or hanging wall averages $134 per ton; the average assay of the next eight ft. west of this streak is $53.81. This gives ample room for opening out two square sets of timbers in width. Assays taken across the vein at this point show that a width of 33 ft. will average $24. There are, of conrse, spots to he found assaying up in the hnndreds.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Barhee & Walker, Aug. 16, $2,102; Hananer, Ang. 16, $2,400; Germania, Aug. 16, $1,980; Great Bssin, Aug. 16, $1,900; Horn Silver, Aug. 17, $70,000; Frisco, Aug. 17, $12,596; Alice (Montana), Aug. 16, $6,000; Horn Silver, Aug. 17, $10,000; Barhee & Walker, Aug. 18, $1,869; Mayflower, Aug. 18, $4,400; Germania, Aug. 18, $3,600; Hananer, Aug. 18, $2,200; Stormont, Aug. 18, $4,550; Frisco, Aug. 20, $5,000; Hananer, Aug. 20, $2,000; Germania, Aug. 20, $1,980; Eureka, Aug. 20, $2,190; Eureka Con., Ang. 13 and 14, $9,333.38; Christy, Aug. 17, $2,230; Northern Belle, Aug. 15, $5,939.75; Ontario, Aug. 12, $49,836 58; Standard Con., Aug. 15, $24,322.89; Bodie Con., Ang. 22, $7,376; Christy, Aug. 20, $1,733; Northern Belle, Aug. 18, $5,697.13; Star, Ang. 15, $2,551.37; Bullion, of Paradise, Aug. 16, $1,243; War Eagle (Idaho), Aug. 17, $2,945; Buffalo, Aug. 17, $3,206; Christy, Aug. 23, $2,111.

New Incorporations.

The following compauies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

ARRON M. Co.—Aug. 20. Location: Tucson. Capital, $1,000,000, in 10,000 shares. Directors—D. C. Brown, O. Lord, J. C. Todd, O. Emlay and S. R. Page.

PACIFIC COAST M. & M. Co.—Aug. 24. Object: Buying, selling and working of mines bearing precious metals in California, Nevada, Utah, Montana, Idaho and Arizona, and to acquire mill sites, water richts and real estate in said States and Territories, besides carrying on the general business of mining and milling. Capital, $10,000,000, in 100,000 shares. Trustees—G. D. Crocker, J. P. M. Perham and John P. Kelley.

SAYS the San Lnis Ohispo *Mirror:* "There is an almost inexhaustible quantity of chrome ore to he mined in this county. This industry is lying idle, and hut little or no mining being done, for tbe simple fact that the price paid for chrome ore delivered at the depot in San Luis Ohispo does not pay."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

DOWNS.—*Dispatch*, Aug. 20: The Downs mine at Volcano is being retimbered, and a new shaft is to be sunk. The mill is lying temporarily idle, owing to the scarcity of water. A cupply of water cannot probably be had before Octoher or November.

A CONTRACT has been let to Louis Longtime to sink the Golden Gate mine at Volcano, belonging to Moyle & Chequette, 120 ft deeper, which work was commenced on Thursday of last week. The contract price for doing the work, we understand, to be $12 per ft. The mine is now down about 375 ft. The Forgus, or old Gillick mine, just below Volcano, owned by Moyle & Chequetto, closed down last week for the purpose, we are told, of letting a contract to sink the shaft 150 ft deeper. The mine is about 230 ft deep. Mr. Jas. Morgan is still prospecting his claim on Hunt's gulch, and we are told the prospect for a rich and permanent lead is good. Mr. Stephen Moyle's mine, near the Morgan mine, on Hunt's gulch, is being prospected in earnest, under the supervision of Mr. William Doyle. They are working both day and night. Mr Jas. Meehan purchased the hoisting works of the Yellow Jacket mine, near Drytown, and has teams engaged in removing it to the Volunteer mine, near Jackson, of which he is the owner. Ground has been broken for the sito of a new mill at the Pacific mine at Plymouth, which will be built as soon as possible. The shaft is now down nearly 900 ft. Thirty-six tons of rock recently taken from the Soto mine and crushed at the Pioneer mill, in the Pioneer district, yielded a little over $30 per ton.

BUTTE.

QUARTZ MILL BURNED.—*Mercury*, Aug. 20: The Union mill and hoisting works, near Forbestown, were burned to the ground last Thursday about 1 P. M. The property has been lying idle for nearly 6 months, and there is no doubt but that some one set it on fire, although there is no clue to the parties. The property is owned by a San Jose company. The loss is estimated at $2,500; partially insured. Work has been commenced on the upper shaft of the Treasure Box mine. Major McLaughlin has purchased the interest of G. W. Cummings in the Big Bend property.

CALAVERAS.

RICH GRAVEL.—*Chronicle*, Aug. 20: A large body of rich gravel has been struck in the Corral Flat mine, near town. We were shown some prospects the other day which, to say the least, were simply enormous. Work on the mill is progressing rapidly, and everything in and about the mine is in first-class order. There is not the least doubt but that the Corral Flat mine will prove a permanent paying property.

GLENCOE DISTRICT.—Cor. Calaveras *Chronicle:* The recent extensive operations of the Norwich mining company and the Valentine mining company on their respective properties have created quite a stir in this vicinity. A number of new dwelling houses are being erected in consequence. A large number of men are employed by the two companies. The Centennial mine, an excellent "prospect," not easily surpassed for economical working facilities, has also changed owners. This impulse to the quartz mining interest here is apparently of a more substantial character than heretofore, and if not swamped by an excess of theoretical manipulation, should prove remunerative to the capital invested.

WEST POINT.—As a mining camp, this place has always been second to none; plenty of people leave it in contempt, hut I notice they are always glad to get back here again. The annual product of gold is about the same most every year for the last 8 years. There is little or no placer mining. At the present time our gold product is mostly from the quartz, which has been worked mostly along the surface to different depths, few exceeding 100 ft, and not even that if water was struck. There are a few mines being worked successfully by capital, namely: The Champion mine, 700 ft deep; Henry mine, 114 ft; Jacobs' mine, 100 ft deep; Florida mine, 130 ft; Billy Williams' mine, 130 ft; Walter Barnes' mine, 117 ft. There are also a number of other mines that would wish to be worked providing they were in the hands of those that could work them, namely: The Lone Star, Riverside, Carlton, Constitution, Anna, Woodhouse, Granite, Bismarck, Whisky, Matrimonial, French Lodo, Pride of the West, Moruing Star, Pride of Bummerville, Scorpion, Valentine, Sacramento, Rattlesnake, New Wisconsin, Camele, Lockwood, Tom Paine and the Catarrh mines, all of which I can recommend as being first-class mines for investment. The rock that has been milled from each and all of the above mines along the surface, has paid not less than $50 per ton on the average, and has even run as high as $150 per ton. So you see the reason why West Point can always keep up her annual product of gold. Simply because the mines are here with the gold in them. If that was not the case, our ranchers' fences would wither, dry up and blow away next winter.

DEL NORTE.

BEACH MINES.—Del Norte *Record*, Aug. 20: Mr. Lockhart, who has purchased a portion of J. Wenger's ranch, about 2 miles below town, for the purpose of beach or black sand mining, arrived from San Francisco by the steamer of Sunday last, with all the necessary machinery for commencing work. He has a 15-horse power engine for raising water, and we learn will run 0 machines of a new pattern, and from all we can learn, are a great improvement on the machines heretofore used in black sand mining. Should this enterprise prove successful, and there can hardly be a doubt in the matter, we shall expect to soon see other companies following in the wake of this, and our beach worked for miles above and below Crescent City. Although the ground secured by Mr. Lockhart is called a beach mine, still it is a portion of the farm owned by J. Wenger, and is some little distance from high-water mark, there being other and probably richer claims between this one and the beach. We hope the gentleman will make a success of this enterprise, and being an old hand at the "bellows," and having prospected this claim thoroughly before making the purchase, we have no doubt that he will make it a paying investment.

BALD HILLS QUARTZ MINE.—The work in the tunnel on this mine is progressing finely. It's the opinion of all who have examined it that a few feet farther in the east drift will tap the main ledge. If perseverance deserves success, then the owners of this mine deserve to be amply remunerated for their labor in developing it. We expect to chronicle a rich strike in a few days.

EL DORADO.

BIG SLUICING OPERATION.—*Mountain Democrat*, Aug. 20: The E. D. W. & D. G. M. Co. are making arrangements for working the tailings in Big Spanish ravine, for which purpose they have ordered of the Blair Bros. lumber for 100 flume boxes, which are to be 3 ft in width and 3 ft in depth.

RICH GRAVEL.—Henry Edner and associates, in their mine near Brownsville, have struck a large and rich deposit of gold-bearing gravel. Last week, as a result of 10 days piping by two hands, they cleaned up $1,020.

DAVIS.—Georgetown *Gazette*, Aug. 18: Parties have made all preparations to immediately start up the noted Davis mine at Spanish dry diggings. It is to be worked by hydraulic process.

HUMBOLDT.

BEACH MINING.—Eureka *Standard*, Aug. 13: The Fancher gold saving machine, which we mentioned a few weeks ago as operating on the beach at Little River, is reported to have proved a complete success. Mr. Fancher went below by the steamer last Sunday for the purpose, as we understand it, of having a large number of the machines constructed, to be set in operation at various points along the coast. We believe one is to be set under the

sluice at Ossagan. Numerous intangible rumors are floating around of projected mining enterprises that are a sure indication that the importance of our mines is beginning to awaken and fix the attention of the public.

MARIPOSA.

NEW PLACER DIGGINGS.—*Gazette*, Aug. 20: It is reported on good authority, that rich placer mines have been discovered on Kentucky ranch, between Sherlock's creek and Lyoo's gulch, and a number of claims have already been located

SILVER STRIKE.—We are reliably informed that a rich strike in silver has been made on the extension of the silver mine a few miles below town.

MONO.

BODIE.—*Free Press*, Aug. 23: The Standard is still crosscutting east on the 1000 level, and drifting south from the west crosscut in favorable formation.

STANDARD CON.—This company extracted and shipped to the mill 1,275 tons of ore during the past week from the 800, 385, 500 and 550 levels. The amount of crude bullion received was 2,650 ounces, and the amount shipped to the company was $24,322.89.

BODIA TUNNEL.—Ore is being extracted from ledges Nos. 20 and 21, and 84 tons were sent to the mill, assaying $32 per ton.

NEVADA.

MINE SOLO.—San Juan *Times*, Aug 20: We learn that the Buckeye mine, situated between Sweetland and Birchville, has been sold to a syndicate of Sweetland men for the low sum of $3,000. This mine was originally purchased by an English company from Gen. O. Evans, John S. Stidger, Thomas Cloak and others for $200,000. After working it for many years at a great profit, under the management of Geo. D. McLean, it fell into the hands of said gentleman and Geo. E. Yates. These latter gentlemen worked the mine very profitably for many years, and have now disposed of it, as stated. We learn the new purchasers intend to work the mine by the drifting process.

PLACER.

THE NEW MEXICO.—*Herald*, Aug. 20: We understand that the Adams or New Mexico mine, near Larkin's place, on the road between Auburn and Ophir, has been bonded to responsible parties who propose sinking the shaft at least 200 ft deep, with the view of more thoroughly developing the character of the ledge. A general opinion prevails that this is good property and will pay when rightly opened.

SUSPENDED.—Placer *Times*, Aug 18: Most of the men working in the Baker mine were discharged Thursday evening of last week, work in that mine being suspended for the season. A few men were kept to make a final clean-up in the tunnel and in the canyon.

PLUMAS.

BLACK HAWK QUARTZ.—Plumas *National*, Aug. 20: The new quartz mill on Black Hawk, owned by Lathrop & Co., is running steadily and with good results. The rock is low grade, yielding about $4 per ton, but the ledges are large and easily worked, and we are told that $4 rock can be made to pay a fair profit. Considerable quantities of sulphurets are being saved, containing some gold. This Co. do almost all their own work, and are taking the slow but sure plan

GOOD QUARTZ.—Mr. J. B. Bachelder was in town on Tuesday, and gave us some specimens from a ledge which he has recently opened on the mountain above Crescent. Judging by the specimens shown us, he has a fine piece of property. He says he has from two to five ft of quartz, and thinks it will pay at the rate of $25 per ton. He will soon have a mill at work on it, and should make a fortune out of his strike. "Bach" is a very successful prospector, and finds more quartz mines than anybody, but he has had bad luck in working them heretofore.

JAMISON.—The City Enterprise Co. have stopped sinking and gone to drifting. The shaft is down 270 ft, and they have a drift in, to the west, about 30 or 40 ft. What will be accomplished is hard to tell. They have very little water to contend with in the drift, as the water which comes into the shaft comes from about 60 ft above the bottom. The stream is becoming weaker all the time, and there is not more than enough to keep the pump going, and they run the pump as slow as possible.

CONCENTRATORS.—Greenville *Bulletin*, Aug. 17: Mr. Savercool reports that about the 1st of Sept. work will begin on putting up Frue ore concentrators at the Savercool mine.

SOUTHERN EUREKA.—A pump is now in place that will return water which has already passed through the battery. After being allowed to stand in a large tank and settle, the water can be used again and again. With this arrangement it is regarded as certain that the mill can be kept running steadily up to its full capacity.

CORBIN & CO., ELIZABETHTOWN.—A new shaft is now completed above the one lately used; this will very much shorten the distance over which the dirt must be hauled in the mine; a large dump is made at the new shaft, the washing is done with a pipe—this makes the work much quicker. The drift from the old shaft into Betsey gulch has already reached pay dirt and some gold has been taken out.

A NUGGET.—Mr. Bell has a very fine specimen of quartz taken from the Bell mine, Elizabethtown; it is shaped like a child's cradle, measures 3½ inches long, 2 inches wide, and 2 inches deep, and weighs 25 ounces, gross weight. The head of the cradle is interlaced with gold in a beautiful manner, through the body of the cradle the gold is veined like the lines in moss agate, the amount of gold in the piece is valued at $200. This specimen ought to be placed in some public cabinet. Mr. Bell intends to have it on exhibition at the Greenville fair. Many large pieces of gold have been taken out on the ground now owned by Corbin & Co., by Mr. Bell and others. Howard Corbin lately found one piece on the dump worth $105; from one washing on the dump he took $665. Mr. Bell, on his place, next to Corbin & Co., took out one piece worth $700 and another worth $1,700. Mr. Mills, just below them, is pushing his work along as fast as men and money can do it. The whole region has hitherto only been scratched on the surface, and yet hundreds of thousands of dollars have been taken out. Capital and skill are now united for its development.

SIERRA.

SOLD.—*Mountain Messenger*, Aug. 20: Busch's quartz and gravel mine, Loganville, has been sold for $26,000, the stockholders have gone for their coin to San Francisco.

THE prospect in very favorable for good pay at the Dutch Co.'s gravel mine, at Loganville.

P. WOLFORD was down from American Hill mine this week, and reports the boys putting everything in order for next season's work.

ANOTHER GOLD CHANNEL.—Heskel Peak is in heavy washed blue quartz gravel, just the same as that of the Bald Mountain extension, with gold in every pan prospected. The main tunnel is supposed to be from 15 to 20 ft above the bedrock. Still more cheering news comes from northern Sierra. The Bonanza gravel mining company, Howland Flat, is reported to have found the main channel so unfortunately lost soon after the recent purchase by Cornish capitalists, and the lead is as rich as ever.

TUOLUMNE.

BRIGHT.—Tuolumne *Independent*, Aug. 20: Prospects are bright at the Santa Maria mine. A shaft 45 ft deep shows a vein one ft thick, which, at the top, was a mere thread, having gradually widened as they went down. Rock in the bottom yields $100 per ton. They are troubled with water, and will put in pumping machinery. The ore is broken by two stamps, and ground in two large arastras. Messrs. Howland & Neal are the owners of the mine. On the Garfield mine, located about six miles from Groveland, owned by Messrs. Schulz & Wenzel, of Sonora, the new mill is completed, and the flume to the river nearly finished. More expense has attended the enterprise than was expected, owing to the fact that the survey of the flume struck the river at high water mark in the estimate, and to get water in the flume, when the river fell, it was found necessary to extend it some distance further up. The mill is calculated to reduce the rock at small cost.

NEVADA.

WASHOE DISTRICT.

UTAH.—*Enterprise*, Aug. 21: During the past week the incline has been sunk and timbered 20 ft. The ground in the bottom is somewhat softer.

CON. VIRGINIA.—On the 2500 level the joint Best & Belcher crosscut has been advanced 25 ft.

CALIFORNIA.—During the week there have been 90 tons of ore extracted from the 2000 level. The joint Ophir winze on the 2500 level has been sunk and timbered 15 ft.

OPHIR.—Have completed repairs on the compressor, and have repaired the Yoho at the 1405 station.

MARIPOSA.—On the 2500 level in the joint Union Con. east winze are cutting out a sump pit at the 2600 station.

UNION CON.—On the 2700 level joint Sierra Nevada drift hole No. 3 has been extended 75 ft, and drift hole No. 4 20 ft.

SIERRA NEVADA.—East crosscut No. 1, extended 20 ft; No. 2 crosscut, drift hole from end, extended 165 ft; No. 4 crosscut has been extended 21 ft; main north lateral drift extended 27 ft.

NEW WELLS-FARGO.—The west drift on the 500 level is still passing through the same favorable looking formation reported in last week's letter.

YELLOW JACKET.—We have extended the north drift on the 3000 level 30 ft during the past week, making the present length of the same 70 ft from the switch. The quantity of water pumped continues about the same—60 inches.

CANDELARIA DISTRICT.

MOUNT DIABLO.—*True Fissure*, Aug. 20: On the 3d level the east and west ends from the north crosscut, from the bottom of winze No. 1, have been driven to total a length of 30 ft each, and show considerable low-grade ore. Winze No. 3 is down 25 ft in a favorable formation. The east drift has advanced 10 ft, and shows small streaks of high-grade ore in the face. On the 2d level the west drift shows great improvement, the face showing a 2-ft ledge of ore averaging $70. Total bullion shipments for June and July was $150,974.76.

NORTHERN BELLE.—The intermediate, between the 1st and 2d levels, continues to look well, and is yielding the usual quality of ore. The other shaft levels show no important changes. During the week about 88 tons of ore have been taken out daily. Owing to scarcity of men, caused by sickness, the company were able to run only about 30 stamps, but hope for an improvement in this respect in a few days. Bullion shipments for the week ending August 18th, $22,070.53; shipments on August account to August 18th, $42,057.00.

HOLMES.—The winze in the main tunnel has attained a depth of 40 ft. The ground in the bottom is much harder than a week since, but works very well. Operations at the lower tunnel are fast assuming a business-like appearance.

EGAN CANYON DISTRICT.

TO THE FRONT.—White Pine *News*, Aug. 20: Wednesday afternoon we paid a visit to Egan Canyon, the first in 4 or 5 months, and were agreeably surprised to find a great change for the better. In our neighboring camp all is now life and activity. About 80 men are employed in the camp—over 40 in the tunnel workings, 30 in the Jenny Lind mine, and the balance about the mill. They have already over 1,500 tons of good ore on the dumps, and are constantly increasing the quantity, so that it is pretty safe to estimate that they will have 2,500 tons by the time the mill is ready to start. At the mill in force of men is employed taking out the tanks and old timber. A great deal of work is required to put the mill in running order. A large roasting furnace will be erected, and the tanks formerly used done away with altogether. Mr. E. N. Huick, a competent workman in this line, has charge of this part of the business. An additional wing will be added to the mill. Water is being brought in through a ditch run a quarter of a mile through flats to the west. About 8 inches is already flowing. In these flats Mr. John Darnell has laid out a brick yard for the company, and is now building a kiln which will contain 150,000. These will be used in the construction of the furnace and other necessary work. The Egan company have done an immense amount of dead work—enough in fact to discourage almost any other company in the State—and it must give their superintendent, Judge O'Connor, great pleasure to feel that the time is fast approaching when his company will reap the reward of their vast outlay and patient labor. The mill will not probably be ready to crush before the middle of November or the 1st of December.

LEWIS DISTRICT.

MINERS DISCHARGED.—*Silver State*, Aug. 10: The Starr & Grove mine shut down last Monday in consequence of the disarrangement of the air compressor. One of the mills has also stopped and some 60 men are thrown out of employment. It is thought that operations will be resumed in 3 or 4 weeks, which is about as soon as the machinery can be repaired. Several men have left there for Butte, Montana. Tuesday the Chinese had a lively time among themselves. They got into a general row, in which pistols were freely used, but without effect, as none of the belligerents were killed or even seriously wounded.

ARIZONA.

GLOBE.—*Chronicle*, Aug. 13: Owing to the recent heavy rains in this section, work on some of the properties has been temporarily abandoned, but the reports received are very encouraging, and show an increasing confidence wherever development is being made.

THE MACK MORRIS.—This mine continues its regular weekly output of bullion, and it is looking fully as well, if not better, than usual. The new hoisting works are doing excellent service, and ore is being taken out in larger quantities than the mill can work with its present capacity.

SILVER NUGGET.—Supt. Lennon informs us that the east crosscut is now in 156 ft, and the face is in soft ground, intermixed with clay, quartz and porphyry. There is quite a flow of water.

WASHINGTON—Globe copper.—The shaft has reached a depth of about 60 ft, and the vein is reported to be getting more solid.

BORVA GROUP.—In a few days work will be commenced on these mines, under the supervision of Capt. S. L. Burbridge. The property is in the vicinity of the Old Dominion copper company's mines, and is owned by this company. It is probably as favorable a prospect as can be found in the district, and under proper management will develop into a valuable property.

OLD DOMINION COPPER MINES.—Reports of the latest developments on this property are very encouraging. Since connection was made with the tunnel and shaft, they have had splendid air, and work progresses more rapidly in consequence.

MINERAL CREEK.—Latest advices from this property are that a station is being put in at the bottom of the shaft, and on its completion sinking will be resumed. The direct connection of shaft and tunnel has been made, showing a 6-ft ledge with 3 ft of solid ore, and of good grade. The machinery in the mill works well, and as soon as it is possible to get the supplies to the mill, everything will be in readiness for starting up.

MINERAL HILL DISTRICT.—The Elizabeth is the north extension of the Alice mine, and has a ledge 17 ft in width. Two shafts have been sunk on the claim, one to a depth of 19 ft and the other 13 ft. The ore carries $42 in silver to the ton and averages about 40% of lead.

SAN PEDRO DISTRICT.—The recent rainfall in this section is without precedent. Everything was flooded and volumes of water dashed down the mountain sides like raging rivers, and floated through the valleys like oceans in miniature. But, the good results of this plenteous wetting down of the soil are already apparent.

YELLOW HAMMER.—The vein has widened out to four ft and now carries from 25 to 00% of copper, and assays as as high as $200 to the ton in silver.

SAMPLE MINE.—Shaft No 2 on this mine is down 22 ft, uncovering a remarkably rich vein two ft and a half in width. The ore will probably average $100 clean across the vein, and some of it has assayed as high as $17,798 90. Quite a number of prospectors are at work in the district, opening up new claims, and it has indications of a bright future. The ditch for the new stamp-mill is completed, and the machinery was expected to arrive from Tucson this week. It is the intention of the builders to have the mill in running order by the 15th of next month.

SILVER DISTRICT NOTES.—Arizona *Sentinel*, Aug. 20: A contract has been let this week to sink a 100-ft shaft on Black Rock mine. Breaking off croppings continues, with no perceptible diminution in the quality of the ore. A 100-ft contract is under way to drive a shaft in the Clip mine. There is no alteration in the excellent grade of ore from this mine. Mr. Pickenback has the contract for sinking shaft. On the 11th inst., a cloud burst, and in 15 minutes there was six ft of water where before it was dry and sound. F. P. Clark, in trying to save some sacked stone coal, was carried 50 ft down the Pacific wash, under water. He escaped with a few local bruises. The shaft on the Mamie mine is filled with water, and the miners have been temporarily transferred to Lost mine, from which they are taking some remarkable rock.

TOMBSTONE.—Cor. *Arizona Citizen*, Aug. 21: The mining news of the week does not offer anything particularly new or attractive. The Cincinatti mine last week closed down, reason not definitely known. The hoisting works lie out west of the Empire, and with the hum of machinery silenced and doors closed look particularly lonesome. From what can learn the ore upon the dump of the Girard is not of sufficiently high grade to be worked with profit when hauled to the mills and worked, though a mill on their own property would be a paying investment. The Gentle Belle, owned in San Francisco, is looking exceedingly promising. Their shaft is down 120 ft, with a five-ft ledge. As they are merely sinking a prospect shaft and following the ledge, it is not as straight as it might be, but if the prospect improves as much during the next 100 ft as it has for the last 50, I hope to be able to chronicle at least a small bonanza. The property is in the hands of well known mining men in California, and they will push matters to a successful issue if possible. Some of the mines here have experienced annoyance from bad air, owing to the cloudy days and total absence of wind. The Blue Monday had some little difficulty in this way, but Mr. Stout, the Superintendent, ordered one of the latest improved blowers from San Francisco, and it having arrived and been put in working order, there will be no trouble in future.

COLORADO.

BIG STRIKE IN THE SLIDE.—Boulder *News*, Aug. 10: This week we can say that a new impetus has been given to deep telluride mining, by the fact that the Slide mine, which for some time has been under a cloud, is now opening up the largest vein of telluride ore ever found in the mine. In the 500 level a drift was commenced which ran in apparent barren ground, but last week Mr. Pughe set some men at work to drive it still farther, feeling that the ore chute was in that direction, and, after going but a few feet, they came upon a body of ore 3 ft thick, worth to bulk over $200 per ton, with streaks of the richest ore ever taken from the mine, assaying way up into the thousands. The company is to be congratulated.

GEO. R. WILLIAMSON is still pushing developments on his Yellow Pine group, and will shortly increase his shipments of ore.

FROM Mr. Leggate, foreman in charge of the tunnel operations at Talcott by the Chicago & Colorado Co., we learn that work is being steadily carried on in two of the tunnels. The air drills are doing the work nicely, and, after running 10 or more holes, they are withdrawn and the blasts fired by electricity. This method does away with the hazard attending blasting when fuse is used.

DAKOTA.

GALENA NOTES.—Black Hills *Times*, Aug. 20: Galena has suffered nothing from the excitement in other portions of the country, and many of her people think that the stampede will end in their camp. Col. Davey is working a large force of men, taking out a large amount of ore, much of which is shipped to Omaha. Just now there are parties looking the camp over for the purpose of reporting to Eastern capitalists. If the right parties take hold of Galena there will be more than the Sitting Bull put on a paying basis in a short time. There never was a camp more neglected than Galena. Just north of Galena there is a large bed of carbonates that has been known for the past four years. It lays like ashes on top of the high hills between Galena and Crook City. The time will come when this part of the country will have the attention that it so richly deserves.

BLACK BUTTES.—The mine at the Black Buttes, or Inyan Kara, owned by Rinehart, Alden & Co., has at last developed into a veritable wonder. They have been sinking a shaft for months, and at last have struck some carbonates that go away up in the thousands. At the Portland mill they have been digging for water for their mill all summer. Two shafts were sunk about 150 ft apart to a depth of 80 ft. Water was found in each of them, and to increase the quantity a crosscut was commenced between them to cut off the water that comes down the gulch in the bedrock. In the crosscut yesterday a body of ore was encountered that is very rich as well as extensive. The ground on which the find was made belongs to Captain Foster, of Golden Gate.

NEW CAMP NOTES.—A *Times* reporter went out to West Virginia yesterday and took in the camp. There has been a vast change in the appearance of the town in a week. Quite a number of new houses have been built, and many others are being erected. Judging from the improvements the people have an abiding faith in the staying qualities of the mines. There has been a vast improvement in the working propensity of the mine owners, a great many of them having gone to work in earnest to develop their property. The Jefferson people have done some more work in their mine, which shows up a larger body of ore, as has also been done in the Richmond and Adelphia. The Deadwood Carbonate Co. have a shaft down about 18 ft. They are in capital rock that shows up well in spar and other indications. The Franklin Co. have their tunnel in 25 ft. It is showing up well in carbonates, improving every day, and with day and night shifts will soon be a bonanza. In the Wilkinson mine, in the new shaft, they have struck a two ft vein of rich ore, going down almost perpendicularly. Frank Bryant is there with a force of men at work, greatly encouraged, and promises to show up a good mine in a week or two. Stacy Hill was visited and from the location, formation, etc., we think it a promising part of the camp, that will show up better soon. It would be impossible and useless to speak of each mine in detail; they are all about alike in appearance so far as surface indications go. It takes money and muscle to develop them, and that has not been indulged in to any very alarming extent yet.

IDAHO.

HOISTING WORKS FOR BULLION MINES.—Wood River *Times*, Aug. 10: New hoisting works have just been ordered for the Mayflower and Eureka mines, of Bullion. They will be of sufficient capacity to sink 500 ft, and will be in position within 90 days.

UP DEER CREEK.—Deer creek, near this city, is attracting a great deal of attention just now. Over 200 prospectors are exploring it, and quite a number of transfers of property have taken place there lately, at figures ranging from $1,000 to $50.000. Last Friday a gentleman representing a New York company secured a half interest in the Pennsylvania, New York, Jenny, Isabelle, Republican, Annie, Keystone and Blue Jay group of claims. The consideration is stated at $10,000.

GALENA.—Frank Parmalee, the surveyor, who has just returned from a trip to Galena, says that that town and vicinity are improving rapidly. Several buildings are going up in town and the inhabitants look for lively times about next pay day. About 200 men are at work, for not less than $4 per day, and the hills are full of prospectors, charcoal burners and laborers. Prospectors are seen everywhere, and met with all the time. Mr. Moore is pushing work on the smelter, with energy. He intends to have it ready to run in 50 or 60 days. The Senate mine, which is owned by the same parties as the smelter, is opening up splendidly, and is said to be showing a valuable body of ore. On the Gladiator, Eunice and Little Chief, Mr. Johnson is working 24 men. A tunnel which will be about 600 ft long and tap the ledge at a depth of 311 ft, is being driven on the Gladiator. Three shifts were at work recently, but were driven out by foul air. Blowers have since been procured from San Francisco, however, and an increased force will now be put on.

MAMMOTH.—Idaho *World*, Aug. 16: Wilson & Whitney are developing the Mammoth, on Summit flat, on an extensive scale. Already there has been 1,000 ft of main tunnel run, with additional cross cuts and adits of over 700 ft. The ledge varies from 2½ ft in width, and carries ore worth from $40 to $100 a ton. At present there are 25 men at work. The mill, an 8-stamp, about a mile from the mine, is kept running day and night to its fullest capacity.

MONTANA.

LEXINGTON.—*Inter-Mountain*, Aug. 18: Surveys are being made for sites for 2 mills of 40 stamps each, one on either side of the hill, where it runs to a point in the forks of Missoula gulch. While we can learn definitely nothing about the sale to the French company, yet appearances indicate that the transfer will be made in a few days, and in that event the main shaft will be sunk 1,000 ft as speedily as possible, with crosscuts run to the ledge, and ore taken from the levels at every 100 ft below the surface. The process of reduction will probably be similar to that at the Moulton. That is, the ore that goes first into crushers, then on to dryers, from which it is taken to the stamps where it is pulverized, thence to the roasting furnaces, and then to pans for amalgamation.

THE BROADWAY.—Upon inquiry, we learn that the sale of the Broadway mine to the London company, by Messrs. Chas. Dahler, E. F. Johnson, W. W. Morris, S. Hurst, W. F. Sanders and P. A. Largy, is a genuine transaction, the sum paid being nearly a quarter of a million dollars. This mine is reached from Butte via Pipestone, and is 35 miles from the city, and at the south base of Highland peak. It has an incline shaft 150 ft, with numerous drifts, from which large quantities of ore have been taken. This mills about $15 per ton in gold. A 50-stamp mill will be erected. The 10-stamp mill of Morris, Johnson & Sanders goes with the mine. It is 3 miles up the river above the mine. The 18-stamp mill of Largy & Dahler, at Iron Rod, is not included in the sale. The mine is half a mile from the Jefferson river. The purchasers are Chadburn & Richardson, formerly Californians, but now residing in London.

THE BUMMER.—The ore body in the Bummer mine holds out evenly. The north wall has been struck, but no south wall has yet been found. The vein, as far as explored, is 12 ft wide. The east drift has been driven 50 ft on the ledge, and 200 tons of ore taken out, which average 80 to 90 ounces.

THE BELL.—Large quantities of ore are being taken out and stored preparatory to the erection of a smelter, a site for which has been purchased of Wm. Gwsley, on Blacktail creek. This gives Butte her fourth set of smelters.

NEW MEXICO.

THE CIMARRON.—*News and Press*, Aug. 14: Mr. I. W. England, Cbauncey Kilmer and Prof. Austin, who visited the Rebel chief, in Ute Creek district, the property of the above company, last week have not yet decided as to their future course in regard to machinery. The Howland pulverizer was wrecked by a pick point which had been fed with the ore. Messrs. England & Kilmer have returned to New York, but Prof. Austin remains to try 5 tons of ore in the Rhodo Island stamp mill, to determine if a stamp mill shall be substituted for the Howland pulverizer.

IMPORTANT MINING SALE.—Messrs. E. G. Schree and John B. Atkinson, of Kentucky, who have been here for several days, have consummated an arrangement, in connection with parties here, by which they acquire a large interest in the copper properties near the head of the Ponil, embracing the Mayflower, Monarch and Pullman lodes, and a considerable body of adjacent territory. A company is to be formed at once by these parties and the Maxwell Land Orant Co. jointly, for the immediate development of these valuable properties upon a large scale and in the most vigorous manner. Mr. Atkinson is to have the management of the copper company, and this fact is regarded by those who know him as a strong guaranty of thorough, practical and productive work. These gentlemen do not hesitate to express a high opinion of the value of these mines.

ELIZABETHTOWN.—We are at present favored with a large supply of water for gold washing, and our enterprising miners are not slow in taking the advantage of such a favorable opportunity; old sluice boxes are now in place and every day we see the boys smiling over some large clean-up of the precious yellow, that can be found in no other place in New Mexico or the United States in such paying quantities. But little is known, outside of this camp, of the amount of gold that is taken out daily from the different gulches centering to the base of the famous Old Baldy mountain. The camp is truly a field for prospectors and capital that cannot be surpassed by any other. I regard to-day the gulch mines or placers, of which here we have thousands of acres, only now in their infancy of development and cannot be worked out in the next 5 generations. There are thousands of acres of ground here that will pay from 30 to 75 cents per square yard, that water can be put upon the ground by a small outlay of capital. We deny the fact that even one gulch in this district has ever been worked out or abandoned on account of "no pay." But little attention has been paid to the development of the rich quartz lodes that make a perfect net-work centering to Old Baldy. This camp can, with the present development on quartz lodes, produce ore sufficient to run 100 stamps, that will run from $20 to $150 per ton. The ore is free milling and is easily worked, being mostly decomposed. There have been parties here this week carefully examining our quartz lodes, and went away so well satisfied that we are promised a 20-stamp mill, to be in operation by the middle of October, in close proximity to our town.

UTAH.

CHLORIDERS MAKE A CLEAN-UP.—Silver Reef *Miner*, Aug. 13: During the week our city has been enlivened by the presence of numerous chloriders from the river. These men have been working all spring and summer in getting out ore from the various mines in the vicinity of the Stormont mill, and have at least succeeded in having it worked. We are informed that the result has been highly satisfactory to the men in almost every instance. The pressure of these men contributed to materially enliven the town, and must have considerably increased the coin reserve of many of our merchants. The men have mostly returned to the scene of their labors, and we shall not expect them back until there is another "clean-up."

SILVER REEF.—A trip to the various mines during the week revealed the fact that the work of development and progress moves on with satisfactory results.

THE CHRISTY CO.—The lateral drift north in the California is being advanced rapidly to connect with the upper workings of the Maggie, and is opening up in good shape. The north-end mines of this company, embracing the Tecumsah, Silver Flat and Manhattan, are all showing as well as at any time previous.

THE BARBER & WALKER.—The ore bodies recently encountered in the north workings of the mine continue to improve.

THE STORMONT CO.—Work continues uninterrupted in the north and south drifts at the bottom of the Savage vertical shaft, both faces being in fair grade ore.

THE STORMONT.—Preparatory work has begun upon this mine by the lessees, and within a few days the pumps will be in motion. It requires about 3 weeks' time to dry the mine sufficiently to begin underground work.

THE MILLS.—The stamps of the district are all busy—with the exception of the Leeds, which is about to undergo repairs—and the steady bullion output and express report of shipments is a sufficient indication of their successful operation. We expect to be able to report a round $150,000 for this month's product, with a decided improvement in the near future.

Copper in Arizona.

Cost and Profits of Production.

Now that the eastern alarm respecting the price of copper, seeme to have subsided in a measure, and a reaction has already commenced, it is, perhaps, a fitting occasion to take up the question of the influence of our copper mines on the eupply of this metal, and ask ourselves, what the proepects are for thie Territory and especially of this district, in contrihuting to the output of the conntry, and what future and permanent effect it may have on the price of this commodity. Our statistics show that the consumption of this metal in the United States, has arisen to ahout 30,000 tons per annum, ehowing an increase of ahout 50% within the past 10 yeers. This amount is produced from our own mines exclusively and notably hy thoee of Lake Superior; The Calumet and Hecla alone yielding fully one-half this amount. In fact, we already produce more than we consume, and in epite of our high protective tariff which prevente us from importing the article, we are shipping several thousande of tons annually to Enrope, to relieve our own market; the company referred to having recently contracted to ship 4,000 tons to England, at a price considerably below the lowest quotatione for the current year. As the supply increases, they must continue to increase their shipmente in order to maintain the price, unless an increasing consnmption keeps pace with the increased eupply.

It is self evident that if it were not for our tariff, the price ruling could not he eustained, and to snetain it, we must continne to ship our eurplus abroad.

Now, let us see the effects of this state of things, on the future of the copper market, and the position of Arizona as one of the sources of enpply. It is conceded hy those who have visited thie district, that our copper mines here give promise of being important factors in the copper problem. In fact, it is acknowledged that some of our oree are richer than any found either in this or any other country. This heing the case, it is not improhahle that we may, at no dietant day, regulate in a great measure the supply and price of this metal. True it is, that tbe developments are comparatively recent, but this ie not singular when we consider how remote we have heen, and still are from the great highway whieh lead to the markets for this metal. This difficulty, however, has bsen in a measnre overcome hy the completion of the Sonthern Paoific railway the last year, and is likely to he still further overcome hy the construction of a hranch connecting ne with the main road at nd distant day.

But how does the case etand at present, as regards the cost at whicb we can turn out copper, and the effect it may have on othsr mines, producing low grade ores?

It ie said that the cost of copper from the Calumet and Hecla mines is ahout 12½ cents per pound, laid down in New York or Boston. If this is the case, the cost from several of the other Superior mines must he greater. hoth beoause the ore is still lower grade and the facilities for economical working not so great. It is therefore apparent that if any of our mines can produce copper and place it in the market at less than the cost to others, eome of the Superior minee finding it unprofitable to work, will shnt down, and this will he an offset to the increased production in other quarters; or they will endeavor to maintain the price hy sending ahroad a larger ehare of their product; meanwhile, the growing consumption will help to eustain the price, hut if it ie not sufficient, then eimulteneously with a decline comee the cessation of production in certain quarters, and many of the Snperior minee which are swelling the volume of copper production have never paid dividende (except in the form of assessments,) even though prices have averaged frequently much higher than at preeent. The conclusion is, that if pricee do not go up, some of tbese companies will go down, ae assessments are not a popular form of dividends, especially when there is a check to advance in prices, resulting from a cheaper source of supply.

Let us suppose then that some of our ores, as sbown hy various average assays of the Old Dominion mines (for we have not heen favored with the assaye of any of our other copper properties) yield 33⅓%, or one ton of copper to three tons of rock. As these ores are known to smelt freely, it ie not probahle that the cost of emelting can he greater than that of stamping and harreling the Lake Superior mineral.

The expense of mining and fuel will he somewbat greater, hut this is of small consequence, ae compared with the contrast hetween oree yielding 5%, so that we are led to the conclusion that, deepite the question of coet of mining and transportation, we have a decided advantage over our competitors. If we take 25%, ae a hasie of yield (which eeems moderate, in view of what we know ae to the Old Dominion aseaye, ae well as the ore emelted from open cute made on the eurface of these minee, eome two or three yeare since) with miner'e wagee at $4 per day, and charcoal coeting $20 to $25 per ton, it doee not eeem poeeihle that with the facilities theee minee offer for economical working, the coet of copper ought to exceed three to four cente per lb. To transport this to the Eastern market will coet, eay two and a half cente per lb., or $50 psr ton; and we ought to he ahle to lay it down there within eeven centa per lb. In fact, it would not eurprise ue to find that in the caee of oree yielding 25%, the coet would be coneiderably less than tbis, as it is difficult to see how the expense can he as great as we have estimated, for our calculation is hased on the enormous cost of $5 per ton for mining and delivering at smelters. On one ton of charcoal for one ton of copper (or four tons of ore), and $20 per ton of copper additional to cover contingencies, even this only reaches three cents per lb. as the cost of production here.

Now, it may strike eome of our friende bere, tbat it ie not in their interest, or that of the public, to puhlish sucb data, less it may affect the market unfavorahly in proportion to the publicity given to such figures. We, however, view it quite differently and ignoring, (as we are hound to do, in diecussing matters of such general and widespread intereet) the personal notions, and prejndicee of individuals, we take the hroad ground that the interests of the district are hest enheerved hy stating what appeare to he plain facts, ae far as present indications can guide us, and we firmly helieve that neither the district nor personal interests will euffer hy giving them cnrrency.

As to the effect sucb a cost of prodnction might have on the price of coppsr, we do not helieve (for the reasons already given at the outset) that even when we tnrn out here as we hope to soon, from 50 to 100 tons of copper daily, it will affect the price any more, if as mnch, as it wae affected a few weeke since, by tho operatione of copper epeculators in the East, who donhtless mede use of the remarkahle developmente here to depress the price, for their own ende, and having accomplished it, the price is returning to its normal figure, which always is, and always will he, governed hy the law of eupply and demand, except when temporarily influenced hy etock operators who always take advantage of any paseing circumetance to carry out tbeir manipulations, whether it be in merchandise or stocks.

Our friende who are interested in copper mines, need have no feare, for if we can turn out copper cheaper than cen he done elsewhere, the Leke Superior men themselves will wish to take a hand with us for their protection, as it is clear they cannot compete with ue when our smelters hegin, as they will very eoon, to turn out a fair amount of copper bullion.—*Globe Chronicle.*

Progress in Mining.

Since mining men have introduced improved machinery, there has heen a very noticeahle progress in mining. The rapidity with which numerous prospects bave been developed to extraordinary depths, and oftentimee to pay, has astonished those who are not familiar with the varions kinde of machinery used so advantageously in mining. It is a good eign when a district discards ae much as possihle the primitive methods, and adopts those which are more modern. A good power engine and hoister, with an industriove force of practical miners, will accomplish more in one week's time than the same force would do in a month hy the other method. As eoon ae a miner ie confident that hie location is upon mineral, and few will care to lahor anywhere elee, he should use every endeavor to facilitate the work hy introduoing machinery. In this no time ehould he wasted. Success in mining is attained, other things heing equal, hy adapting means to ends. It ie not so much a game of chance as in using good business judgment. The calling is just ae legitimate and is far more likely than many other branchee in which men engage. The sooner miners get over the idea that the fickle gods preside over their fate—that luck has more to do in making locatione than developing—the sooner they will he rewarded. In entirely new districts, where snow ie on the ground, or where nothing has heen learned of the succesive formations, it might be granted that fortune has something to do with it, hut it is a poor thing to he guided hy, and ie seldom attended with the success whicb is desired hy miners. The hest men in mining camps are those who go about the work legitimately, and who use mnch the same forethought which is found in any otber business. These win the highest succese soonest, and use their so-called good fortune to hetter advantage when it is secured.—*Leadville Democrat.*

Refuse at the Mints.—The skill and precision with which the operatione of the United States minte are conducted are well illustrated by the yearly decrease in the percentage of waste for which an allowance is made hy the Government. Mr. McGinnis, Chief Engineer of the Philadelphia mint, hae just had cleaned a small sewer which carriee off the drainage from the roof and hoilere. The filth which it contained wae firet dried, then pulverized, then put through the waehing machinee, and finally the gold and silver were removed from it hy mercury. The amount of bullion thue recovered ie worth only $143.85, whereas when the eame eewer was cleaned, 19 yeare ago, gold and eilver waete worth $21,000 wae found in it. The precious particlee escaps from the furnace etacks, and falling upon the roof, are washed hy the rain into the eewer.

All claime of any value in Cooper district, east of Ward, were relocated the first part of the week. The locators think the railroad will come near enough to make minea in that district valuahle.

The total population of Weaverville, Trinity county, ie 1,358. Of theee there are 859 whites, five hlacka and 494 Chinese.

Tell the Story!

Yes, tell the story, and show the devil, thonght we, as we read the lateet of rnm'e doings in "our own" city:

"Sure, she hasn't as much clothes to her hack, the dear lady, as I'd take to lift a hot saucepan from the fire." This distressing condition of affairs was yesterday related to a *Call* reporter of the widow of Capt. James Jules Sanderson Jewshury, niece of the late Sir William Hamilton, of H. B. M. Consulate service. Mrs. Ann McManus, of No. 27 Minna street, the reporter's informant and landlady of the scantily-clothed widow of a British officer, made this statement, and without waiting for the reporter to recover, supplemented it with the further announcement: "Yes, and she hasn't even that, for she can't leave her hed for the want of a gown, at all." Mrs. Jewsbury, the reporter learned, had another reason for not leaving her hed, and that reason will continue sufficient to keep her there until she has recovered from the effects of a severe heating said to have been administered to her hy her brother, James Leslie, ahout a week ago.

In any considerable number of people have the same kind of an opinion regarding Leslie that Mrs. McManus has, he is indeed an unfortunate man.

"The hig hrute," remarked Mrs. McManus, in one of her calmer moments, "for him to strike and heat the poor lady, and she his own sister, just because she wanted him to pay me part of their and his children's board hill owing me, and me a one woman. 'Give me, Mr. Mac some of the money, won't you, James?' she says so gentle and ladylike. 'I'll hreak your face in,' he answered, and with that he hit her across the face, and made it as hlack as your hat.

He took the Money

And got drunk with it, as he always does, and the money helongs to her. It comes every month—$75—to her from her agent, and Leslie makes her sign the money over to him, and he spends it. Not a cent does she get, and he'd kill her if she didn't sign the paper over to him. They have been with me four months, and she a prisoner all the time, because she hasn't a dress to put on and go out with. She had a lot of heautiful dresses, hut he drank them all up, and her jewelry, too. He has three children hy a wife who committed suicide two years ago, and no wonder she did, poor soul. One of the children is in the country, and two of them here. The four of them stay in one room, he and a child in one hed, and she and a child in another hed. He has been treating her shameful ever since she came to him to take care of his children, hut the last month it got too had for anyone to stand. He'd knock her down and take hold of her ankles with hoth hands, and twist them. Oh! but he's a brute! So at last me and Bridget Whalen, another roomer in the house, complained, and the British Consul told the police officers, and now he is arrested and there is a chance for the poor lady to he protected. Won't you come up and see her?"

The reporter accepted the invitation, and found Mrs. Jewsbury in one of two single heds in a scantily furnished front room. The landlady assumed a hustling, good-natured authority that gave the invalid no opportunity to ask for explanation or the reporter to offer excuses. When Leslie's name was mentioned, his sister said, "Oh, I am sorry this disgrace has come upon him. I am afraid that when he has been given the net above he will go down very fast. I was just thinking of writing him a note and telling him not to be despondent. He never meant to do me any harm, I am sure. He is only hasty."

This speech seemed to give Mrs. McManus the keenest anguish, and it was plainly hy a great effort alone that she kept from interrupting with vehement objections. At its conclusion she eyed the speaker hopelessly for a while, and then appealing to the reporter, said: "Now, look at that, will you! Just hear her talk! He's hasty, is he? And he ain't down to the hottom of the hill yet, eh? Look here, will you," and, notwithstanding a feehle resistance, the landlady had the sister's left arm hared and tenderly held it up for inspection. The arm was shockingly hruised and discolored from the shoulder to the wrist.

"That's only where he twisted her arm when she dared to say something about his doing something for his children," said Mrs. McManus, evidently greatly relieved that she had shown the reporter what brother James' thoughtless haste resulted in.

Mrs. Jewshury is a woman less than 30 years of age, and was undoubtedly a very heautiful woman hefore she endured the suffering she brought upon herself when, with intended kindness, she came to her widowed brother to take care of his children. She speaks like a woman of refinement and culture, but appears to be

Utterly Broken in Spirit

By her disheartening situation. She was born in Scotland, she says, married an officer in the British army, and as a young widow went to live with her uncle, Sir William Hamilton, British Consul at Boulogne-sur-Mer, France. "Mamma," she said, "wanted me to be with her brother, dear Uncle William, in his old age. I was with him only six months, the first time, when I was recalled to Scotland hy a cablegram, and went home to see my mother and sister die. Six months after I returned to Uncle William he died, on his 88th hirthday. Seven of my family and my husband's family died within two years, and so I came to Canada here. I found him very much changed, though. I expect some money in addition to my annuity, with which he promised to go into business. He is hasty, that is all, and changed some, hut he never meant me any harm."

"No harrun, except to drive you to Lone Mountain, poor dear," said Mrs. McManus quickly, to drown the sound of the excuses for brother James.

James Leslie was visited in the City Prison, and found to be, like most prisoners, tearfully unable to understand why he should he arrested, of all people. "I chiefly regret my confinement here hecause my sister is in very poor health and requires constant attention. I have not been in business lately, owing to my anxiety for her health, which has kept me close by her side. She is expecting from her husband's estate £375 sterling, with which I intended to go into business. Her income from investments left to her by her husband is £15 a month.

Leslie is a plain, rather pleasant-looking, middle-aged man, whoee wife, a few months before his sister'e arrival, was found hanging lifeless to a gas fixture in her room on Mission street. He is a nephew of Sir William Pemherton. He was found guilty of two charges of aesault and hattery, on one of which he was fined $5, and on the other was sent to the House of Correction for three months.

"Lateral Support" in Mines.—The Supreme Court hes affirmed the decision of the lower court in the case of W. C. Hendricke againet the Spring Valley Mining and Irrigating Company. Plaintiff and defendant owned adjoining mining claims in Butte county. The claims were what are known as "deep diggings," and such as are worked by the hydraulic process. In mining ite own ground the defendant washed away the gravel to points where the hank was deep, and the result was that it caved; and in doing eo a portion of the surface of the plaintiffe claim gave way and fell on the ground of the defendant. Thie portion contained a emall amount of gold-hearing gravel, hut the value of the gold extracted therefrom was much lees than the cost of extracting it. Some time after large portione of the surface of plaintiff's claim caved and fell upon the adjoining ground of the defendant. All the caving wae caused hy the mining done by the defendent. The queetion in the case wae whether the doctrine of lateral eupport appliee to casee like this. The Snpreme Court saye in its decision: "We think not. To apply the doctrine contended for hy the appellant to gronnd of this character would to a great extent defeat the very purpoee for which it was located. Defendant would he liahle for the amount of gold taken from the gravel that fell from the plaintiff'a claim hut for the fact that its value was lesa than the cost of extracting it."

Silk Exhibits at the Mechanics' Fair.

In view of tbe new life whicb eilk culture ie assuming in tbis State, and it ie worthy of note that the exhihits of silk, winding appliances and silk products are very rich in this year'e Mechanics' fair. First are the handsome and well-filled casee of Joseph Neumann, a pioneer in California eilk culture and manufacture. His position is on the main floor, near the musiciane' stand. His exhibit ie an unusually large one, occupying one elevated glass stand and a glass case. Both in variety and quantity of cocoons and raw silk, the dieplay ie remarkably good, and reflecte great credit upon the exhibitor for the care, perseverance and expense he has gone to in endavoring to build up this industry in California. Several pyramids representing the silkworms spinning their cocoons are ehown, hesides over 20 cases of cocoons, all raised in this State. These latter represent many different varieties, from the smallest up to the full size of the French Annual. The specimene of raw silk exhibited are very fine, and estahlish, ae clearly as it is possihle to do, in tbat the silk manufactured from the worm bred in thie State is, in its raw condition, equal to that of any country in the world. Mr. Neumann, through hie own unaided individual efforts, has done much to ostahlish this, and he is deserving of every praise for it. Interspersed among his exhibite are the different medals (nine in all) that have been awarded his exhihits in other placee and countries, the whole constituting a well-arranged display of silkworm productions and the marks of appreciation extended toward them hy others.

The two other exhihits of silk may be fonnd adjoining each other in tbe east gallery. One of these is hy the California Silk Culture Association, which is the name ohosen hy a large number of energetic and puhlic-spirited ladies for their society, which is now the most active agency in awaking new interest in eilk culture. The society hes already enlisted a large number of ladies in different parts of the State in sericultnral experiments, and the resnlts thns far obtained are very encouraging. The exhibit of the Silk Culture Association is very comprehensive. It contains first, a collection of wild silkworm moths from India and China, as also a numher of the ordinary kinds. Tbey are the property of Dr. Behr, of this city. In cocoons, the finest exhihit ie that made hy Mrs. S. A. Sellers, of Antioch. It ie made under the auspices of the association, and comprises the following different varieties, all of California growth: French Annual, Japanese Annual and Bivoltines. The French Annual cocoone are considered the best, for manufacture, heing also the largeet. The Bivoltines, or, as the name eignifies, hi-annnals, are tbe smellest varieties. In addition to the cocoons, Mrs. Sellers exhibits a lot in different colore of reeled raw and floss silk, together with a numher of eilkworm eggs and moths. The display is a very complete one, occupying one entire large case, and would do credit to any exhihition in the world. The other exhibitors in the stall of the California Silk Culture Association are Mrs. Keeney and Mrs. McLean, of San Rafael, Mrs. Dodson, of Red Bluff, Mrs. James G. Whitney, San Francisco, Mrs. F. Dennis, Sutter Creek, and Mr. Bettleheim, of Antioch. The newly invented frame for silkworme to wind cocoons, the idea of Felix Gillett, of Nevada City, ie worthy of notice, as are two very fine specimene of the California wild silkworm moth. It is stated that a very similar kind of moth to the California one is found in some portions of Tartary, and that the psople make from it a rough silk cloth that gives unending wear. Garments made from it have been handed down hy tbe Tartars from generation to generation, from time immemorial. Mrs. T. H. Hittell, the indefatigahle Secretary of the California Silk Culture Association, has some interesting old German illustrated worke treating of the eilkworm and silk culture, and Miss Mary Wackenreuder, of San Bruno, hae a very pretty imitation in wax of the mulherry tree, and the silkworms feeding. The operation of reeling the eilk from the cocoone may he seen on Wednesday and Saturday afternoons.

One of the most striking displaye in the pavilion is that of the California Silk Manufacturing Co., of this city. It consists of a large upright glass case filled with eilk manufactures, chiefly spool silk. There is an architectural method of showing this spool silk, which shows much skill, and presents a charming effect. An excellent imitation of the State Capitol, at Sacramento, and the stepe approaching thereto, and the lawns approaching it are all made of silk manufacture. The hnilding is wholly of spools of selected colors, and embracing all kiuds of silk thread. This exhibit should be eought for hy all who visit the fair.

Silver Reef's hullion ehipmente are gradually increasing, and we may soon expect to eee dividende resumed in many of the propertiee which suspended early in the epring hy reason of the striking miners. There is no reaeon why the Reef should not again occupy the prond poeition it held a year ago as one of the leading hullion producing campe on the Pacific coeet. Silver eandetonee have certainly not lost their grit and grip.

The grose yield of the Ontario up to the month of Auguet, wae $8,750,358. It hae paid 65 dividends and is good for aa many more. In fact the great mine ie said to he only in ite infancy.

Grazing throughout Arizona is the finest ever known.

Assaying Argentiferous Galena.

Take ont tho front grate of an ordinary cooking stove with a good grate space and draft, and pnt in a piece of thin earthen drain pipe about nine inches in length and three inches inside diameter, supporting it on hits of brick so that it rests about two and a half or three inches above the grate. The tnbe should be heated in an oven or otherwise as hot as possible before settiag it, so that when a fire is built under and around it, it will not enap or hreak into fragments. Build tho fire so that tho air may pass through the tnbo from front to hack and escape through the fire without danger of the coals falling into it. Let the fire gradually increase until the greater part of the tube is at a bright red heat, the front of the tnbe being loosely stopped with a piece of fire-brick trimmed to fit.

Weigh ont on apothecary's balance ahont one-tenth of an ounce of the ore reduced to a fine powder hy grinding it in a mortar; also, two separate lots of one-half ounce each of granulated lead free from silver. Mix one part of the lead with the ore in the bottom of a small scorifier; cover the mixture with the rest of the lead, put the scorifier into the extemporized muffle. Close the month of the muffle until the load has melted, then partly open it to let the air llow in. If the muffle is hot enongh the lead will soon hegin to ecorify the liquefied lithargo formed collecting as a ring around the sides of the vessel and gradnally increasing in quantity, nntil the whole surface of the melted metal is covered. It is well to add to the contents of the scorifier two or three pieces of borax glass (borax that has been melted in a crucible and poured out on a piece of iron to cool) the size of peas, if any of the gangue of the powdered ore remains on the top of the metal and is not slagged and absorbed hy the litharge. As soon as the ring of slag closes over the metal, remove the scorifier; let it get cold, then hreak it, and hy pounding separate the slag from the button of metal.

Pnt a dry hone-ash cupel, weighing ahont the same as tho hntton of metal obtained from the scorification, in the muffle, let it get red-hot, then drop in the clean hntton and close the muffle nntil the metal is liquefied, then open it partly.

Lead nnder saoh treatment slags off into litharge, the latter carrying with it all the hase metals and impurities. It is absorbed almost as soon as formed (if the muffle is properly heated) into the porous houe-ash cupel. Tho button gradnally decreases in size, and as it gets small it must be watched, so that when the last of the lead passes off into slag, and the silver (if any is present) hrightens or assumes the color or luster of the pure metal, the cupel may be removed to avoid loss hy volatilization. If the ore contained any silver a small head of that metal will he found in the cupel; if none, the cupel will he empty. Sometimes, in poor ores, the head will he almost microscopic, so that the cupel must he carefnlly examined before setting aside. Weigh the head, if fonnd, on a fine balance, and multiply the weight in grains hy 291,600, tho result being grains of silver (with possihly a little gold) in a ton of ore. Error may arise from the presence of silver in the test lead, so that it is always hest to test it for that metal (hy scorification and cupellation, as above). If it is fonnd to contain silver, and a purer sample cannot he readily procured, determine hy dnplicate tests as accnrately as possible the amonnt present, and make proper allowance for this in calculating other assays in which the lead is used.

Good scorifiers and cupels can be obtained from any dealer in chemical apparatus, etc. In some instances a large French olay or even Hessian cruoible, with a hole knocked in the hottom, can he made to serve as a good muffle for such tests, instead of the clay pipe. In this case the side of the orucible becomes the bottom of the muffle, and if a little dry sand or bone-ash is spread over it, it can be made level enough to support the scorifier without tipping.

Under favorable conditions such tests can he made in an hour or an hour and a half.

Mining a Stable Industry.—Mining is as solid, suhstantial and profitahle an indnstry as any in the world. Year after year, as appliances for the cheap reduction of ores get nearer perfection, mining becomes a more stable interest, and investments in that line become more certain of good retnrns. The wonderful snccesses that crowned the efforts of so many of the placer miners of California acted against the qnartz mining interests of the coast. The rich pay dirt of Tuolumne county, Cal., with its $50 to $1,000 a cart load, was something that captivated the puhlio fancy, and it could not get down to such a thing as sinking hnndreds of feet throngh hard rock after a possihility. In the "early days" a string of sluice hoxes, a rocker, or a pan, was ahout all the plant needed; quartz mining reqnired expensive machinery. The puhlic did not care for any of it. Gradually, however, the industry has worked its way along, till it stands among the first in magnitnde and profit. Quartz mining, great as it has hecome, is still in its early stages of development, and every year will add to the volume of money invested in it, and increase the profits accruing from it.

The Virginia *Chronicle* denies a rumor that the force of miners in the Bonanza mines is to be increased. It says there is nothing underground to warrant their working more than they have at present.

Useful Information.

How to Detect Imitation Diamonds.

Imitation diamonds, usually known as "paste diamonds," are simply glass of great purity. The Providence *Journal*, which is published in the immediate vioinity of the locality where most of the cheap jewelry of the country is produced, furnishes the following information, which may he useful to the unskilled, who may have occasion to purchase cheap diamond jewelry:

"When imitation diamonds were introduced, it was found that to cut glass precisely like a diamond did not produce the sparkle characteristio of the diamond, therefore to secure this the flat surface on the top of the diamond was made pyramidal on the imitation, and, of course, ended in a point. By certain laws of light this pyramidal snrmounting of the glass provided for the required distribution of ray snrface to produce the diamond sparkle, or something akin to it. A real diamond is never cut with the pointed apex, and hence it was possihle always to distinguish the real from the epurious. But after a time the huying pnhlio learned this little circumstance ahont the cutting process, and other means were resorted to. The glass was cut precisely like the diamond, and the sparkle was given to or provided for it hy a coating of white foil appliod to the lower side of the glass. The setting of many diamonds is arranged in such a way that the bnyer may see the nnder side of the gem. This was overcome by arranging the setting so as to prevent inspection of this kind, which could not be done nnless the stone was dismounted, if we may use that term.

"With these facts known to the huyer of diamonds, he need not be deceived except in the latter case, where the setting hides the under snrface, and if he has any douht ahout that he can let it alone. But the object of imitation diamonds is not to deceive buyers; if it was they would not he offered for two dollars. No one, however deficient in diamond criticism, need be deceived in buying diamonds. No dealer of any repute ever attempts to sell imitation for real diamonds. No reputable man ever thought of it. His reputation and occnpation would soon be gone. There are very few persons who huy trinkets who do not test their wares at other than the huying place, particularly if the gem is a costly one, and it is certain no one was ever presented with jewelry of presumahle worth who did not set out at once to learn its purity and valne, and very disappointing it has douhtless heen to find in some cases that the gold or diamond was only hrass or glass."

How to Tell a Good Potato.

Everyone knows there is a great difference in the quality of potatoes, and any person can tell a good from a poor one after it is cooked; hut how to distinguish them in the sack is a secret to the great majority of people, and one well worth knowing. To distinguish a good from a poor potato, take a sound one, pay no attention to its outward appearance, hut divide it into two parts with a sharp knife, and examine the exposed inner surfaces. If there is so much water or "juice" that a slight pressure would seemingly cause it to fall off in drops, you may he assured that it will he "soggy" after it is hoiled. That is evidence of a poor potato—and don't yon huy it.

The following are the requisite qualities of a good potato: When cut in two the color should he yellowish white; if it is a deep yellow it will not cook well. There must be a considerahle amonnt of moisture, though not enough to collect in drops and fall off, even with moderate pressure. Rnh the two pieces together and, if it is good, a white froth will appear aronnd the edges and also upon the two snrfaces, after they are separated. This signifies the presence of a proper quantity of starch. The more froth the more starch, and consequently the hetter the potato; while the less there is the poorer it will cook. The qnantity of the starchy element may also he judged hy the more or less ready adherence of the two parts. If the adherence is sufficient for one piece to hold the other up, that fact is evidence of a good article. These are the experiments nsually made hy experts when huying potatoes, and are the hest tests that can he given short of hoiling; hut even they are hy no means infallihle.

Wool Oil.—The term "wool oil" carries little meaning to those outside the business. Before wool is run throngh the carding and spinning machines, it mnst he well oiled in order to hold the fiber and prevent its flying ahout. For this purpose an oil must he used that can easily he removed after the operation, and that will do no injury to the wool. It must therefore contain no acid. Many individuals have heen for years experimenting to obtain just the kind of oil needed, hut we are not aware that anyone has yet produced an article that gives nniversal satisfaction.

Bands of Music are forhidden to play on most of the large iron hridges of the world. A constant succession of sound-waves, especially such as come from the playing of a good hand, will excite the wire vihrations. At first the vihrations are very slight, hut they will increase as the sound-waves continue to come.

Animal Vaccination.

Prof. Pasteur recently gave an address in London, Eng., on animal vaccination, in which he reviewed his experimeats and researches in that direction. This suhject appears to be creating deep interest in Englaad and on the continent, and is certainly one of the highest importance to all interested in any business which involves the risk of animal life, hecause of the prospect which it affords of reducing cattle diseases to a minimum.

After the conclusion of the address, Sir John Paget, in the name the of Medical Congress, hefore whom it had heen delivered, thanked the professor for his effort and for his great work of doing for the lower animals what Jenner had done for the human race. "France," says Prof. Pasteur, "loses every year hy splenic fever animals to the value of $4,000,000." In the course of his remarks he said: "Fifty sheep were placed at my disposal, of which 20 were vacciaated. A fortnight afterwards 50 sheep were inoculated with the most virulent athracoid microhe. The 25 vaccinated sheep resisted the infection. The 25 nnvaccinated died of splenic fever within 50 hours. Since that time my energies were taxed to meet the demands of farmers for snpplies of this vaccine. In the space of 25 days we have vaccinated in the departments surrounding Paris more than 20,000 sheep and a large nnmher of cattle and horses."

Smoky Chimneys.—Who is there that has not, time and agaio, heen botherod, almost to death, by volnmes of smoke pouring out of the wrong end of his chimney or stove-pipe? In this connection it would he well to heed the advice of Dr. Franklin: "Should the chimoey of a house, for want of previous cooideration, he fouod to smoke, no afterthought will compensate this want of forethought. And he who has hegun in this manoer can only expect to have the ill-construction of a chimney to comhat with, which is ofteo impossihle to alter." There is no greater mistake than supposing that smoky chimneys were nnknown hefore our times, and that the unsightly contrivances on their tops—frequeotly ahortive—are the notahle inventions of the present day. From the first iotroduction of flues, smoky chimneys have heen always proverbial nuisances, although from ohvious causes such complaiots were infinitely fewer than they are now. Smoke often returns into a room of a morning when the fire is first lighted, not from a fault of the chimney, hut from the cold air in the flue, which prevents the smoke gettiog up till the chimoey is warmed, and the air in it rarefied.

Good Health.

Medical Advice.

The St. Louis *Globe-Democrat* happily hits off "the suggestions of the doctors" as to the best means of avoiding sunstroke:

AS TO DRINKING.

Dr. Smith's Advice.	*Dr. Brown's Advice.*
Stick to cold drinks; they keep the skin moist.	Avoid cold drinks; they suppress perspiration.
Iced tea is especially wholesome.	Iced tea is dangerous.
Milk is heating.	Milk is a delightful summer drink.
Beer is a natural summer laxative.	Beer is bad in summer.
The light wines are heating.	The light wines are cooling.

AS TO EATING.

Dr. Smith's Advice.	*Dr. Brown's Advice.*
Eat all the meat you can.	Avoid meats.
Eat all the vegetables you can.	Vegetables are dangerous.
Avoid pastry as you would death.	Pastry is good summer food.

AS TO WEARING.

Dr. Bliss' View.	*Dr. Barnes' Assurance.*
Stick to your flannels.	The wearing of flannels is a fatal delusion.
Woolen clothing should be worn in sufficient quantities to keep a uniform temperature.	Wear only linen and light fabrics.

THE HEAT.

Dr. Hammond's Advice.	*Dr. Baird's Injunction.*
Never mind the sun while you have a wet cabbage leaf in your hat.	Keep out of the sun; otherwise you will encounter great danger.

The Cause of Somnambulism.

Various theories have heen putforth to account for the phenomenal state known as "somnamhulism." A writer in the *Phrenological Journal* says that it is due to incomplete sleep. That in complete sleep the hrain is in a quiescent state as a whole, hut in somnamhulism it is a sleep only in parts, and in other parts active or awake. Dr. W. A. Hammond, a medical writer of some note, says that somnamhulism is "analogous to sleep." He says of a person asleep: "If this quiescent state of the hrain is accompanied, as it often is with nervous and excitahle persons, hy an exalted condition of the spinal cord, we have the higher order of somnamhulistic phenomena produced, such as walking or the performance of complex and apparently systematic movements," etc.

The *Journal* differs with the Doctor. He says that if the brain is at rest and the spinal cord active, it would he as if the hrain of the person was entirely removed, so far as the actions performed are concerned. If the hrain is removed, or what is equivalent, perfectly quiescent, there is nothing to cause aotion in the spinal cord, which is not self-acting.

The editor states his opinion of the cause of the phenomena substantially as follows: The hrain, in somnamhulism, is only a sleep *in part*—a portion of the hrain is asleep and another portion is awake, and in a state of intense activity. From these exoited portions of the brain the stimuli pass to the motor mechanism of the spinal oord, through which, in their turn, the muscles are set in action, which produce the motions and acts of the somnambulist.

Enough is known of the mechanism and working of the hrain, especially in the singular peculiarities in its hlood supply, to render it quite certain that the phenomenal condition referred to, of a partial quiescence of the hrain, is a possihle thing.

May we not also infer that all dreaming is due to the same cause. In perfect sleep there is no dreaming, no action of the muscles whatever.

Hygienic Value of Mirth.

Mirth has an hygienic value that can hardly he overrated while our social life remains what the slavery of vices and dogmas has made it. Joy has been called the sunshine of the heart, yet the same sun that calls forth the flowers of a plant is also needed to expand its leaves and ripen its fruits; and without the stimulus of exhilarating pastimes perfect bodily health is as impossihle as moral and mental vigor. And, as sure as a succession of uniform crops will exhaust the hest soil, the daily repetition of a monotonous occnpation will wear out the best man. Body and miad require an occasional change of employment, or else a liheral supply of fertilizing recreations, and this requirement is a factor whose omission often foils the arithmetic of our political economists.

To the creatures of the wilderness affliction comes generally in the form of impending danger—famine or persistent persecution; and under such circumstances the modifications of the vital process seem to operate against its long continuance; well-wishing nature sees her purpose defeated, and the vital energy flags, the sap of life runs to seed. On the same principle an existence of joyless drudgery seems to drain the springs of health, even at an age when they can draw upon the largest inner resources; hope, too often hafiled, at last withdraws her aid; the tongue may be attuned to canting hymns of consolation, hut the heart can not ho deceived, and with its sinking pulse the strength of life ehhs away. Nine-tenths of our city children are literally starving for lack of recreation; not the means of life, hnt its object civilization has defranded them of; they feel a want which hread can only aggravate, for only hunger helps them to forget the misery of *ennui*. Their pallor is the shallow hue of a cellar-plant; they would be healthier if they were happier. I would undertake to cure a sickly child with fun and rye-hread sooner than with tidhits and tedium.—*Dr. Oswald, in Popular Science Monthly.*

The Sunbeam in the Sick-Room.—Only a little glimmering, dancing ray of light, hnt on its golden wings what hlessings did it not hear. It came to the window of the room where all through the long dreary night the weary snfferer had restlessly tossed to and fro. The hired nurse had carefully closed the shutters, to exclude the light of the early morn, and availing herself of a few moments' rest, had fallen asleep in her chair. But notwithstanding all her precaution, the little sunbeam found one crack where it could peep through, and throw all its soft shimmering hrightness full npon the face of the invalid. The sick woman gave a start of glad surprise, for it had been many weary days since even one ray of the glorious sunlight had fallen npon her vision. She spread out her thin, almost transparant hands to catch the genial glow, and a faint smile passed over her emaciated face. Silently she feasted npon the golden hrightness, as it whispered to her of the great hlue arch above, and the earth with its carpet of green, awaking to new life and heanty at its tonch; forgetting her pain, she sank into a quiet slumher. And when the physician came, a smile of satisfaction wreathed his lips, as he saw the improved state of his patient. Ah! Doctor, what all yoar drugs failed to do, that little golden messenger from heaven accomplished, for it wooed sweet sleep to the eyes that hefore had refused to close.—*Phrenological Journal.*

Remedy for Poison Oak.—Dr. S. A. Brown, U. S. N., states in the *Medical Record* that he has fonnd a specific to the troublesome eruption produced hy the poison oak or poison ivy so common in our woods and along old fences. This specific he finds in hromine, which he has used with nnvarying success in at least 40 cases. He uses the drug dissolved in olive oil, cosmoline, or glycerine, in the strength of from 10 to 20 drops of hromine to the ounce of oil, and rubs the mixture gently on the affected parts three or four times a day. The bromine is so volatile that the solution should he renewed every 24 hours. The ernption never extends after the first thorough application, and it promptly disappears within 24 hours if the application is persisted in.

Tobacco Deafness.—A few days ago a Cincinnati law student suddenly found himself deprived of hearing. Calling upon an aurist, he was told that the habit of smoking cigarettes, in which he had long indulged, had occasioned an obstruction of the Eustachian tubes, ducts which lead from the throat to the ear. This is a very frequent cause of deafness in smokers. Tobacco occasions destruction of the sense of sight, of taste, and of smell, as well as of hearing, and not infrequently occasions paralysis of the whole nervous system. Why will our young men destroy their senses by its use?

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Pan Amalgamation; Foundry Notes; Rock Drill and Wilbraham Rotary Pump, 129. Passing Events; Sand; Silver in Auriferous Rocks; The Chlorination Works at the Plumas National Mine, 136. Gold Nuggets; At the University; A Monocycle, 137. Noticee of Recent Patents, 140.
ILLUSTRATIONS.—The Victor Rock Drill; Rotary Pump to Run by Belt; Wilbraham Rotary Pump with Engine, 129. The American Center Velocipede, 137.
CORRESPONDENCE.—San Diego Mines, 130.
MECHANICAL PROGRESS.—Cutting Tools and their Uses; Belting Material; Carbon in Steel; A Mechanical Cotton Picker; A Four-Cylinder Engine, 131.
SCIENTIFIC PROGRESS.—Prof. Winchell on Evolution; Ozone; Muscular Activity and the Decomposition of Matter; Another Prehistoric Man; Water and Its Impurities; Parasitic Worms; The Astronomer Royal; Water in Gems, 131.
MINING STOCK MARKET.—Sales at the San Francisco Stock Boards, Noticee of Assessments, Meetings and Divideuds, 132.
MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Dakota, Idaho, Montana, New Mexico and Utah, 132-33.
USEFUL INFORMATION.—How to Detect Imitation Diamonds; How to Tell a Good Potato; Wool Oil; Animal Vaclnation; Smoky Chimneye, 135.
GOOD HEALTH.—Medical Advice; The Cauee of Somnambulism; Hygienic Value of Mirth; The Sunbeam in the Sick-room; Remedy for Poison Oak; Tobacco Deafness, 135.
MISCELLANEOUS.—First Gold in California; New Mill at Sawtooth; Subterranean Heat; Educating Indians; The Mining Regions of California; Middle Portion of the Cometock, 130. Assaying Argentiferous Galena, 135. Make Public Your Development, 138.
NEWS IN BRIEF, on page 140 and other pages.

Business Announcements.

Passing Events.

Tho latest news from Washington regarding the condition of the President is very disconraging, and it seems very douhtful if he will ever recover. The people throughout the country have been extremely anxious for days past, and have watched the telegrams carefully in hopes of seeing more encouraging signs. But at this writing (Thursday) there seems small hope of his recovery.

In another column we give the account of the death of several prominent mining men, among them George Daly, well known all over the coast. It looks as if some rigorous measures ought to be immediately taken hy the Government to prevent the Apache raids in Arizona and New Mexico, and to establish a more peaceable state of affairs along our borders. The Indians do not seem to have much respect for the prowess of our soliedrs. Another General Custer is needed down that way.

An event of more than ordinary importance chronicled this week, is the inauguration of a new President of the State University. The inaugural address marks President Reid as a man with the "coursge of his opinions," and one who will maintain vigorous administration.

Mining news, as will be seen hy our summary, continues favorable from nearly all points. The hig hydraulic pump on the Comstock is performing its duty well now, and has been doing this long enough to show that it will continue to he effective. But no honanzas have yet come to light up there.

THE hydraulic pumps of the C. N. S. shaft were running at the rate of 10 strokes a minute last Saturday.

Silver from Argentiferous Copper.

Ths process of extracting silver from argsntiferous coppsr hy liquation is still employed in soms localities, although it has hssn now gsnerally snpplanted hy the cheaper and more efficisnt systsm hy the wst way. The liquation process is based on the circnmstance that when copper containing silver is alloyed with a certain proportion of lead, and afterward heated above the malting point of ths lattsr metal, hut helow the tsmperature at which coppsr entsrs into fusion, the lead hecomes liquid and drains or sweats out, carrying with it the grsater portion of ths silver, whilst impure copper remains hshind in a cavernous or spongy form.

It has heen found hy experience, according to J. Arthnr Phillips, that to conduct this operation successfully, the lead should he present on the alloy formed, in the proportion of 11 parts of that metal to three of copper, and that for every part of silver present, ahout 500 parts of lead should he employed.

In the Hartz, according to Lamhorn, hlack copper containing one-sixth per cent. of silver can he treated with advantage hy liquation; hnt when only one-eighth per cent. of this metal is present, its extraction does not pay the expenses incident to the operation.

This process is not, however, generally applicahle to the extraction of silver from ores in which that metal forms the most valuahle and important constituent; and since it has often heen described with much detail in various German and other treatises on metallurgy, we refer those who desire information on this subject to the authors in question. The prooess of liquation will he found described in the works of Villefosse, Kerl, and others.

Sand.

At the last meeting of the San Francisco Microscopical Society, Mr. Chas. H. Dsnnison read a very interesting paper on the formation, composition, uses and valne of sand. He showed 46 varieties of sands from all parts of the glohe in small vials, and the same mounted on slides for the use of the microscope. The formation he claimed was due to the aotion or various forces of watsr npon rocks, the crushing and grinding of rocks hy glaciers, then carried hy the streams to the sea, and to the effect of heat and moisture. He claimed and calls attention to the fact that rocks whsn heated and thrown into, or water thrown upon them, decrepitated, or were broken in pieces. He named a place where angular and sharp-pointed sand was found in position where it was made, and showed samples of it. The power, steam or gas that pushed the hill or rock ahove the surrsnnding hills, has escapsd through the rock and reduced it to sand. He showed hy statistics that in 30 years past ordinary sand for huilding and mannfactnring nurposes amonnted to ahont $3,000,000,000, and that all the golden sands, hydraulio and quartz gold found in California for 30 years amounted only to $1,400,000,000, so that the ordinary sand of commerce had heen the most valuahle. The action of water upon quartz sand had heen shown hy experiment, that in 60 years rolling upon a heach hy the waves, sand one-fiftieth of an inch in diameter was angular and not worn, showing not a particle of ahrasion. Mr. Davison supposed the opalized sand on the Pescadero heach had heen rolled hy the water a vast cycle of time, and mentioned a hnndred thousand years as the time it might take to wear that sand into its heautiful and perfect shape.

Our Extra Edition.

We had intended this week to publish an extra douhle sheet edition of the MINING AND SCIENTIFIC PRESS, hnt find it desirahle to puhlish more engravings which take further time for preparation, so we have to postpone the douhle sheet until next week. A feature will hs a complete catalogue of all the exhihits in the Mechanics' fair. Another will he a history and description of the wire rope cahle railroad system, which has heen so successfnl in this city. We shall of course have the usual varied mining aud metallurgical articles, several of which will he of universal interest. We shall print a very large edition of the issue of Septemher 3d.

HOW TO FIND THE NEW COMET.—An Eastern authority furnishes the following directions for finding the new comet, now ahout coming within the vision of the naked eye: Look in the northeast sky shortly hefore snnrise and see near the horizon a hright morning star, Alpha Auriga. Just helow this, to the left, see another dimmer star, Beta Auriga. Then with your opera-glass see helow Beta, and almost in a line with it and Alpha, the new comet. This comet will soon pass into the constellation of the Lynx and then into the Great Bear, when it will he hrightest. It will then pass through Virgo and disappear south of the eqnator. When nearest the sun it will also he nearest the earth, and, fortunately, the moon at that time will he absent.

THE *Lyon County Times* says there is a marked improvement in the manner in which the Sntro tnnnel has heen rnn of late.

The Chlorination Works at the Plumas National Mine.

[Written for the MINING AND SCIENTIFIC PRESS by C. H. AARON.]

It was decided to try a Brunton furnace. This is a horizontal, hrick-lined, rotating iron cylindroid, the diameter at the centsr heing greater than at the ends, and that at the fire end grsater than at the rear end. It rsvolvss npon heavy flanged rollsrs, and the motion is imparted hy traction, two of the rollers, on the ascending side, hsing connectsd hy a strong shaft, on one end of which is a worm-whssl, driven hy a screw on a transverse shaft.

This mode of driving the furnace is open to one ohjection. If, from inaccuracy in the setting, or from unequal snhsidence of the foundation, the furnace should he out of level in the direction of its length, it must he adjusted hy lessening the distance hetween the rollers at the end which requires to he raised. Bnt if one of these rollers is connected hy a shaft with one at the other end of the furnace, this adjustment cannot he made without throwing the furnace out of line with the rollers. Hence the furnace should he driven hy gearing, which is indepsndent of the rollers. In the case in question, however, no inconvenience arose from this cause.

The furnace was lined with common hricks, placed on edge, with the greater dimension transversely to the axis of the cylinder. This gave a good bevel, an important point, as the diameter of the shell was 6 ft. 8 inches in the middle zone, and the result was that none of the hricks fell out. In the end linings the hricks were placed on their sides, radially around the central opening, through which the flames from the fixed fire-hox entered, and the smoke, etc., escaped. These openings were furnished with necks, lined with fire-hricks, that at the fire end ahntting (without lap) against the cast rim of the corresponding opening in the fire-hox, whioh was of the same diameter, also lined with fire-hrick.

At first some trouhle arose from the end thrust on the transverse screw-shaft, whioh should have had a step, cast solid with the hed-plate, hut this was overcome hy a stont collar, four inches long, with two steel cupped set-screws at a right angle to each other.

The furnace was driven hy a small vertical engine, admitting of some variation of speed, hut the slowest attainahle was one revolution in three minntes, which was too fast.

The length of the furnace was 12 ft., and it would have contained ahout six tons of concentrated sulphurets from the Frue machines, hut the largest charge put in was ahout 3 tons, as it was found that the time occupied in roasting was nearly proportional to the charge, so that it was not advisahle to run the risk of a breakdown. There was no arrangement for lifting or moving the ore, other than the rotation of the furnace itself.

Uuder these conditions the roasting proceeded with extreme slowness, not averaging more than half a ton of sulphurets in 24 honrs. By inserting a wooden rod through the "peep-hole" in the wall of the transverse flue, and passing it into the rear end of the furnace, it was ascertained that the slowness of the roasting was not due to any deficiency of oxygen (air), as the end of tbe stick hurned readily in the nppor current, hut was almost extinguished when depressed into the snlphur vapor hy which the lower part of the furnace was filled.

It was also observed that when the ore near the rear end of the furnace was well roasted, as ascertained from samples taken hy means of a long spoon, there still remained, in the more capacious middle zone, a large qnantity of unroasted ore. On this account the sampling test was ahandoned, and the progress of the work was ascertained hy closing the damper (in the stack) snfficiently to cause fumes to issne from the peep-hole, when the reqnlred information was afforded hy the smell.

After several experiments it was clear that something must he done to accelerate the roasting. As matters stood it was like putting the ore into a hole in the ground, and causing the flames to pass over while stirring it. Against pntting in lifters there were two objections; firstly, it would increase the dusting; secondly, it would infringe a patent.

In order to hring the ore and the air into more intimate association, and to avoid the interposing dense cloud of sulphurous vapor, a hint was taken from the action of the reverberatory furnace, in which the air, entering hy the open working door, can he seen to pass under the flames, and directly in contact with the glowing ore. Air of equal temperature is lighter than sulphurous anhydride, consequently, heated air which passes through the fire rises to the top of the furnace, while the heavier snlphurous vapors remains, to a great extent, resting upon the ore; hnt cool air is heavier than hot sulphurous anhydride, and is transparent to radiant heat, hence, if introduced hetween the flame and the ore, it not only does not impede the action of the heat, hnt it enahles the sulphur in the ore to hurn, the hot product, sulphurous anhydride, rising, and admitting a fresh snpply of air in contact with the ore.

To attain this condition in the Brunton furnace, the lining of the necks was removed, thns enlarging the diameters of the openings. The throat lining of the firehox was modified so as to make the opening wider, and of the form of a little more than a semicircle. The firehox was also raised, so that the top of the throat shonld coincide with the top of the enlarged opening in the end of the furnaos.

This left a portion of the circular opening in the end of the furnace uncovered hy the slightly projecting neck of the firebox, forming a crescent-shaped aperture throngh which cool air, undilutsd hy the gasses and smoke of the fire, could entsr helow the flames. A piece of sheet-iron was adapted to closs this apsrture when reqnired. The resnlt was most gratifying. The time reqnired to roast a charge of ors was reduced to little more than half, and the fusl in still larger ratio.

A set of experimsntal lifters, made of sheet-iron was then put in. They were holted through the hricks to the shell of the furnace, and withstood the heat and the sulphur much hetter than was expected. They were not allowed to extend within three ft. of the rear end of the furnace, in order that not too mnch dnst might he carried out, and they were arranged in a slightly spiral manner, to screw the ore toward the fire from the helly of the furnace. This effected a still further improvement, and when the writer left the works, the furnace was roasting two tons of clean sulphurets from the Frue machines, or three tons from other concentrators, which were not so clean, in 24 hours, with a consumption of half a cord of wood to the ton.

The working capacity could prohably he douhled hy connecting the rotating furnace with a reverheratory, in which the ore could he partially roasted hy the waste heat, after which it could he pushed into the rotary furnace through the opening at the rear end, hy means of the hoe, and a suitably arranged chute.

The snlphurets of this mine contain a large qnantity of talcose matter, which cannot be separated hy washing. In consequence, it is necessary to add from 4% to 5% of salt in the roasting. Another result of this impurity is, that the nsnal manner of precipitating the gold ohtained hy the chlorination process, namely, with solution of iron protosulphate, does not answer, as the gold settles slowly and imperfectly, heing also very mnch contaminated. Hydrogen sulphide was therefore used with satisfactory results.

The cost of working the sulphurets at this mine need not exceed $10 per ton working two tons per day, and would he less with the reverheratory attachment to the furnace. The material contains from $25 to $60 in gold per ton, of which 80% is extracted. The chlorination works may therefore be called successful.

If this class of furnaces is to he used for the roasting of auriferous sulphurets the following conditions should he observed, which are ores:

also applicable to heavily sulphureted silver

1st. The furnace should he connected with an auxilliary reverheratory furnace in which the wash heat may he utilised for the partial roasting of the ore.

2nd. Each of the four rollers should he independently adjnstahle, as in the older style of Bruckner furnace.

3d. Some arrangement should he provided for lifting and shifting the ore, such as Bruckner's diaphragm, or White's "grooves, oavities or projections." The latter may be formed of hricks suitably arranged in the lining, or if arsenio and antimony are absent, of cast iron, holted to the shell.

4th. The openings in the end of the furnace should he larger than they are usually made, by a difference of 8 or 10 inches in the diameter. No neck or throat lining is necessary, hut simply a cast-iron rim to form a flush face to abut against the neck of the fire-hox.

5th. The neck of the fire-hox should he short and in the form of a muffle, of which the circular part should he, when lined with fire-hricks, of an inch less radius than the opening in the end of the furnace. This form will leave the lower portion of the opening in the furnace uncovered to admit air. In order that this opening may be closed when required, more or less, a movahle cast-iron lip, pivoted at one end, shonld he attached to the flat hottom of the fire-hox neck.

Thus arranged, a Brunton or Bruckner furnace, with auxilliary reverheratory, may he relied on to roast thoroughly five tons of clean pyrites daily. The omission of the neck and its lining in the furnace saves iron and fire-hrick. A neck is more useful at the rear end of the furnace, in order to make proper connection with the flue, or auxilliary furnace, hut this may he made of heavy sheet iron and needs no hrick lining.

To those who are accustomed to the rapid destruotion of iron implements in the roasting of refractory silver ore, it is astonishing to see how long iron can withstand the effect of sulphur in the treatment of clean pyrites, when a sufficiency of air is admitted.

The writer is not aware of an instance in which the continuously acting cylindrical furnaces of the White and Howell-White pattern has heen used for the roasting of auriferous pyritss for chlorination, hut is of the opinion that, with the aid of some special arrangements and proper management, excellent results might he got with great economy.

AT the Eureka Con., Eureka, Nev., new shaft the large hoisting works are heginning to assume shape. The machinery will he placed in position after the completion of the hnilding.

Gold Nuggets.

(Written for the PRESS by HENRY G. HANKS, State Mineralogist.)

The valna of gold can only bs measured hy the labor expended in its production. If gold was as plentiful and as easily obtained as iron, it would hava no greatsr valno.

By common conseat ths world has sccepted the theory, that gold must possess a fixed standard valae, and that the value of everything must be measured hy it, while in reality, gold fluctuates in valno like all other commodities, beiag govarned by ths sams lsw of supply aad demaad. When tha supply increases, as when naw fields like those of California and Australia are discovered, everything elso rises in prico, which is eqnivaleat to a fall in gold. Chevalier, of Paris, who wrote a remarkable work on the precious metals about the date of the discovsry of the gold fields of Australia, predicted a fall in the value of gold, which actually occurred. Jacobs, another colsbrated writer on ths sams snbject, has shown, that in every case of the discovery of aow gold fields, or rich aad productive mines of silver recorded in history, the prices of all other thiags have risca in exact proportion.

Dr. Trask, first Stats Geologist of California, publishod a statemeat, which is quoted by Chevalier, to the effect that the average value of the gold collected by a California miner in the year 1854 wss $3.35 psr diem, while the laborer who washed ths saads of the Rhine in the same year conld only collect the value of 28 cents per day, and that it was for this reason and no other, that wages were higher in California than in Germany.

By far the greater part of the gold found in placer mines occnrs in smsll graias, or "gold dust," as it is called. It is one of the peculiarities of tha precious metal that no great masses have ever hsen found, the largest beiag small as compared with known masses of copper, iron and silver.

The following is a partial list of the most celebrated gold nuggets of modern times:

Foreign Gold Nuggets Weighing More Than 100 Ounces.

1. A mass of gold was exhibited at ths World's fair, at London, which is said to have been 3 hundredweight. It is stated that this specimen was hronght up from a deep mine on the back of a man. If the English hnndredweight is meant, it would be 336 lbs. avoirdupois, or 4,899.89 ozs. Troy. It was brought from Chile.

2. With the exception of the Chile nugget the largest mass of gold on record was found at Ballarat, Victoria, Australia, in 1859, and known as the "Sarah Sands." Its weight wss 2,688 ozs. Of all the great Australian nuggets those from Victoria were the largest and most plentiful.

3. Another found at Ballarat, Victoria, Australia, weighed 2,217 Troy ozs., or about 185 lbs. Troy.

4. The Welcome nugget, also fonnd at Ballarat, Victoria, in 1858, weighed 2,195 ozs., Troy. A sample of this magnificent specimen may be seen in the State Museum of California.

5. The Blanch Barkly nugget, which was exhibited at London, weighed 146 lbs. Troy, or 1,752 Troy ozs.

6. The "precions" found at Berlin, Victoria, Australia, weighed 1,621 Troy ozs.

7. In July, 1851, a very large nugget was found in a pile of quartz at Meroo cresk, or Louisa creek, river Turon, 50 miles from Bathnrst, and 29 miles from Mudgee, New South Wales. It was in three pieces, hut is considered to he of the same origin, and is reckoned as one mass. It was found hy a native hoy who saw the glitter of some exposed portion. The total weight of the three pieces was 106 lbs. Troy, or 1,272 Troy ozs.

8. A mass of gold mixed with qusrtz and mundio was found in 1858 at Burrandong, near Orange, New South Wales. After the quartz and snlphide of iron were removed by hammering, the gold weighed 120 lbs., which heing melted at the Sidney Mint yielded a little over 1,182 ozs. of gold, 874 fine, and valued at £4,389 8s 10d.

9. The "Ural" nugget, found, in 1842, in the valley of Tasohku Targunka, near Miaok, Rassia, is now preserved in the Museum of Miniag Eagineers at St. Petershurg. Several others were found near the same locality of less size. A model of this heantifnl nngget, whioh weighed 96 lbs. Troy, or 1,152 Troy ozs., may he seen in the California State Museum.

10. The "Viconnt Canterhury," fonnd at Berlin, Victoria, Australia, weighed 1,105 Troy ozs.

11. The "Vicountes Canterbury," also found at Berlin, Victoria, weighed 884 Troy ozs.

12. There is said to be a mass of gold in the Mnsenm of St. Petershurg weighing 70 lbs., hnt this is probably the Ural nugget (No. 9) wrongly described; weight, 840 Troy ozs.

13. The "Knm-Ton" nngget, found in Victoria, Australia, weighed 718 Troy ozs.

14. The "Sehlem" nngget, found at Dunolly, in Victoria, Australia, weighed 478 Troy ozs.

15. A mass of gold, found in Kiandra, Snowy river, New Sonth Wales, in 1860, weighed 400 ozs.

16. The "Platypus," found at Sandhurst, weighed 377 Troy ozs.

17. A nugget found at Forrest Creek diggings, Monnt Alexander, weighed 336 (?) ozs. Troy.

18. The Brenan nngget, found in Msroo creek, Turon river, New South Wales, in 1851, imbedded in clay, weighed 364 Troy ozs.; valne, £1,156 sterling.

19. The Beauty, fonnd at Sandhnrst, Victoria, weighed 248 Troy ozs.

20. The "Needful," fouad at Berlin, Victoria, Australia, weighed 246 ozs.

21. A gold nugget found at New Chnm hill, Kiandra, Saowy river, N. S. W., in 1861, weighed 200 Troy ozs.

22. Ths crescent found st Berlin, Victoria, Australia, weighed 176 Troy ozs.

23. A golden augget found at Kiandra, Saowy river, N. S. W., in 1860, weighed 160 Troy ozs.

Specimens of Nntive Gold.

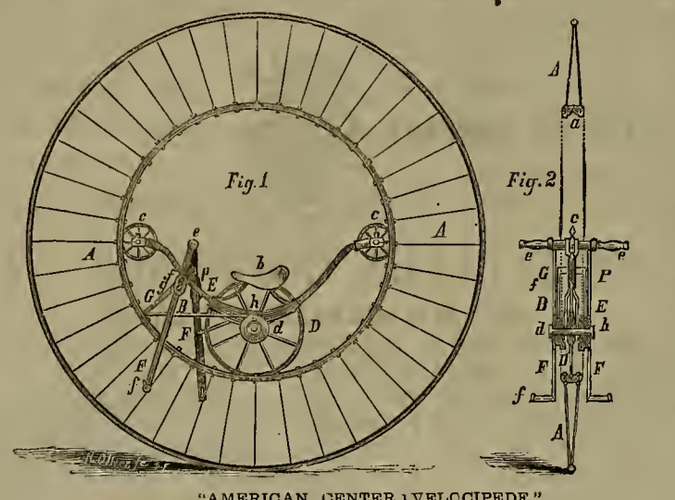
24. One fonad in 1852, st Msroo Creek, Turon river, N. S. W., called "the kiag of the water-worn auggets," weighed 157 Troy ozs.

25. Ths largest nugget found in Australia in a quartz vein, was taken from Old Qnartz Hill, Castlemaine, Victoria, Australia. It weighed 13 lbs. Troy, 156 Troy ozs.

26. A nngget was fouad in 1860, at the Tooloom diggings, N. S. W., which wss nearly solid gold. It woighed 140 Troy ozs.

A Monocycle.

Whea people see the daring bicyclist perched precsriously on top of his two-wheeled steed, those who csnnot ride imsgine he is performing some wonderful feat. He hss two wheels, however, even if they are ia a row; hut whst shall we say of a man who rides one wheel only? There is really a one-wheeled velocipsde, which is exhibited by G. H. Strong, in connection with Dewey & Co.'s Patent Agency at the Mechanics' fair, and the greatest peculiarity of it is that the rider is safer from a capsize than ho is on two wheels.



"AMERICAN CENTER VELOCIPEDE."

The wheel shown in the pavilion and illustrated in the engraving is seven and a half ft. in diameter and has what may he called an open center hub, the central part of the wheel heing snfficiently open for a man to sit where the hub would be in an ordinary wheel. An annular flange is formed on the innsr edge for the grooved driving and guide wheels. The carriage carrying the saddle for the rider is formed of right angled bars having grooved guide wheels on their ends, and a centrally placed bearing wheel immediately under the saddle.

The shaft of the central hearing wheel is extended throngh both sides, and outside its bearing on each side is placed a clutch, arranged to engage with the shaft on the forward stroke of the levers and allow the shaft to revolve independently when the power is relieved.

On the forward bar of the carriage is a short standard carrying a hand bar, which forms the pivot for the levers, which are provided with treadles. To the lower ends of the operating levers are attached the cords which encircle and operate the friction clutches.

To operato the monocycle the rider mounts the saddle, places his feet on the treadle and the hands on the bar. He is then on the center of the wheel, with the center of gravity below the actual center of the wheel. By moving the left foot forward, the lever, hy its cord and connecting clutch, rotates the shaft and central hearing wheel, thus moving the carriage with its rider forward of the center of gravity of the hig wheel, and causing the wheel to rotate and hegin a forward motion. As the pressure of the foot on the lever is released and the lever comes hack for its next stroke, the spring of the clntch rotates the clutch backwards and winds np the cord ready for the next stroke. Meantime the rider has pushed the right lover forward, which acts in the same manner, and, hy working the levers alternately, the carriage is kept forward of the center of gravity and the wheal caused to keep up a continuous revolution, carrying the rider with it. The grooved central and guide wheels revolve on a flange so they cannot he displaced, the guide wheels serving to steady the carriage on which the rider is snpported.

The wheel is guided in its forward motion hy the movement of the hody of the ridsr, who directs the oourse by swaying his weight to one side or ths other. The wsight of ths rider heiag always below ths centsr of gravity of ths wheel makes it run steadily when once in motion from well-known natural laws.

A velocipede of this form is not so difficult to ride as the ordinary oaes, owing to ths rider's weight heing below iastead of ahovs the center of gravity. A very large wheel csn be nssd, as the diameter of whasl is not regulated ia proportion to length of limb as in bicycles. With ths large wheel, and ths rider sittiag below ths center of gravity, a slow motion may he maiatained and tho effort to propel it need not nscessarily hs great. To stop the whesl, the trasdls motion is stopped, when the saddls carriags will roll back of the center of gravity and stop the wheel. This maohins is the iaveation of two citizens of San Francisco, Frederick Langmask aad Peter Strieff.

In the sagravings here shown of thia wheel, which its inventor calls the "Americsn Center Velocipede," *E* represents ths large wheel, *B* is the csrriags carrying its saddle *b*, *C C* ars the guids wheels, *D* is the central bearing wheel. *E* is the standsrd carryiag the haad bar. *e* wheel forms the pivot for the foot levers, *F*, haviag treadles, *f*. The levers, *G*, form parts of compound levers with the levers *F*, but in the mschine at the fair only single levers are used.

Death of Geo. Daly and Others.

George Daly, well known in mining circles on this ooast, was killed hy Indians in New Mexico on ths 18th inst. Daly fignred extensively in a controversy with the Typographical Union in this oity years ago, while in the *Alta* office. He went to Virginia City in 1873, and was for some time engaged as foreman there. He was also Superintendent of the Florida and one or two other mines, in 1876. The Virginia *Enterprise* says: "In Dscember, 1878, he went to Aurora and took charge of the Rsal del Monte mine as Superintendent, afterward taking charge of the Mono and Jupiter mines, and running all three for some time. He came back to this city in Octoher, 1879, and sold his interest in the joh office to Mr. Sutherland, and left, Novemher 1st, for Leadville, Colorado, where he became Snperintendent of the Little Chief. While in Colorado he was Snperintendent of four or five mines, and was Superintsndent of the Chrysolite at the time of the riot. Afterward he for a timo had charge of Gov. Robinson's mines. He then went to New York, and was sent to New Mexico by Geo. D. Roberts to look after certain mines in that region. Mr. Daly was interested with Mr. Roberts in the mines in New Mexico.

"George Daly was a very wide-awake and enterprising man, a stannch and true friead, and a hitter but not unreasonable enemy. He had nothing of the desperado nor even of the desperate man ahout him. On several occasions, while in charge of mining properties, he was involved in troubles where there was hloodshed, bnt he was always sure that he had the law on his side in every move he made. No doubt he was a man heartily hated by many persons, hnt through all he has had the respsct of the really hrave among his enemies, and such will regret to learn that the fearless little man has fallen a victim to the murderous Apsches."

The Indians attacked the outskirts of the settlement and massacred a number of women and children. Daly led a charge of volnntesrs in conjunction with a company of soldiers. Daly, in company with Lieut. Smith, 17 soldiers and some citizsns, followed the Indians. George and the Lieutenant took the lead, and about 15 miles from the mines they ran onto the Indians, who had caused their horses to pass through a small canyon, and they took to the hills. George and the Lieutenant coming np, rushed through the canyon, and were killed almost instantly hy the Indiaas, who were upon the hills.

General George S. Dodge died in Oakland on Wednesday. He was for years a leader in mining ciroles on this coast. No soheme was too colossal for him to handle, and prominent capitalists of this city wers always rsady to stake moaey and credit on his skill, jndgmeat and snterprise. Mining camps in all the Ststes and Territories on this ooast are indehted to his easrgy and capital for development. Hs was taksn ill abont four years sgo, and for thres yesrs has been helplessly invalid.

Capt. W. H. Gillespie, a California and Nevada pioneer, and aa old prospector, was fonnd dead on the desert 30 miles from Darwin, Inyo Co., on the 14th inst.

At the University.

Tuesday was a memorahle day at the Universsity. The occasion wss the insngnration of the newly elected President, W. F. Rsid, the dedication of the Baoon Art Buildiag and the expression of thsnks to seversl publio spirited citizsns who havs made snbstantial contributions to ths fnads and fscilities of the Uaiversity. There was a large attendance of the friends of the institution from different parts of ths State. The character of the exercises and the spirit of ths occasion were gratifying to all. Governor Perkins prssided at the meeting, whioh was held in the Harmon Gymnssium huildiag, sad made an eloquent address, setting forth the high position snd usefulaess of the University and urgiag npon all the dnty of msintsining and advaacing its character and its efficienoy. He then eatrusted to tas new President the insignia of his office.

President Reid accepted the charge in a few well-chosen words, snd then delivered his inaugural address, was which eminently practical in its character and its suggestions. Chas. H. Outman, of the Ssnior Class, followed Mr. Reid's address with an address on behalf of the students. He was snceeeded by John R. Jarhoe, who delivered an excellent oration, dedicating the Art Library bnilding and acknowledging the gifts of the late M. Reese, the late L. A. Pioche, Chas. Mayne, A. K. P. Harmon, and the recent gift of D. O. Mills. Henry D. Bacon, the donor of the Art and Library Fund, closed the literary exercises with an address reviewing the stsps which led to his gift to the University for the pnrpose of securing a center of art npon this coast, from which might emanate correct standards of taste and true views of beanty.

We havs not space for the lengthy address of President Reid, hut take the following remarks he made concerning the colleges of mechanics and mining: I had intended to speak also of our colleges of mechanics and mining, and I conld speak with pleasure of all of our colleges of science, hut fortunately for them they are alresdy rsgarded with a fair share of public favor. Although our colleges of mechanics and mining, representing, as they do, and proposing the solution of so many of the great industrial prohlems of this coast, are regarded with great publio favor, yet until very recently they have received little or no encouragemsnt and as little support. Within the last three years, however, they have received at the hands of the State a recognition from which we may hope for the most gratifying results. I am sorry, however, to believe that by maay they aro too much regarded as a short way to remunerative employment, in which not much work need he done, and in whioh the hands be little soiled. Their purpose is more serious, and I trust that their efficiency may be so increased that the entire industries of this coast may with safety be placed in the hands of our own sons, educated in our own University.

Upon the whole the meeting was one calculated to do the institntion good, to eucourage its friends and stimulate its forces to grester efforts for its prosperous future.

MINERS SHOULD READ THE LOCAL PAPERS.—It is a well-established fact that the recent gigantic legal battle between the Alhion and Richmond companies at Eureka was decided in favor of the latter through a pateat hsing secured to ground on which there had been an older clsim, and that that claim was good and valid until other parties secured a patent to the gronnd without a protest from the original claimants. It is more than probable that the older locaters never read the local papers and consequently missed seeing the patent advertised which covered their ground. This shonld tsach mining men the valne of suhscribiag for and reading their local papers.—*True Fissure.*

MANUFACTURE OF SALT.—John Kinney informs the Battle Mountain *Messenger* that he is very busy nowadays at the salt mill prepariag the article for the market; that his sales average from 100,000 to 150,000 lbs. per month; that the last month he has shipped to Lewis alone, 60,000 lbs. The salt business there, when they get all the mills operating, will be very lucrative.

THE Black Bear quartz mine, Siskiyon county, is said to he paying better than ever of late, from opsrations in the old levels where there is an ahundance of good paying quartz. The mill is now run up to its full capacity of 32 stamps. The same company has also completed their 4-stamp steam mill on Kasch ledge, in the vicinity of the Last Chance mine.

THE five-stamp mill of the May Lundy, Moao county, is bsing doubled in capacity, all the maohinery beiag now on the road, and the new battery will he in working order before the olose of the present month.

Make Public Your Developments.

The following very sensible article from the Salt Lake *Tribune* will apply to mining camps everywhere, so we publish it: There is one great lack in the Utah mining camps to which we have from time to time directed earnest attention. That is the failure of the mining men to publicly make known their doings and the results of their operations. In some of the camps, indeed, the feeling goes even to the length of a positive effort to prevent such information being made public. This latter is excused on the pretense that there is a mining ring in Salt Lake City which interferes to prevent independent sales, and which attempts to hold down deserving mining properties and binder their merits being made known, to the end that when the time comes they may pick up all the best of them for a song. And further, that if public announcement were made of contemplated transactions, this ring would interfere to stop them, or blackmail the owners. We think, however, that the suspicion of this assumed ring is much exaggerated; that while there may have been from time to time a disposition shown by operators here, analagous to the much-talked-of "courtesy of the Senate," which prevented them interfering with each other's transactions or bidding against each other for ores or properties, that courtesy, miscalled collusion, has not been so universal or general as presumed by those who complain of it. But even if such a ring existed, and even it Salt Lake were the small provincial town that theory assumes it to be, the way to cure the evils is certainly not to keep quiet about the mines and mining camps, and to fail to make public the developments and prospects of the different localities. The direct contrary is the way to induce independent and untrammeled capital to come in, to buy these promising claims, and to open up the country. With far less real wealth and prospect of lasting and steady bullion output, other portions of the mining regions are talked of all over the civilized world; the surplus wealth of the globe is attracted to them, and they are being developed by it into the bonanzas nature has made them. But in Utah there is little talk, and nothing like a steady report of what is doing. With a bullion output of six to eight millions a year reported, there is much not publicly known, or that is credited elsewhere. We venture to say that there was more written and published about Lendville in the first year of its glory than there has been said and written about the mines of Utah in ten years. The Ontario shipments are reported regularly, but the developments of the mine, the new works contemplated, the quality of ore taken out from week to week, the quantity of it, the reserve ore bodies, all matters of high interest to mining men are not published. The Horn Silver, which should figure hugely in public estimation, and be a pillar of fire to guide hither the capitalist who has more money than he can profitably employ elsewhere, is scarcely mentioned: and the public knows little of what is doing except a brief statement of bullion shipment from time to time. These large properties should be a benefit to the countries in which they are. in the way of inducing investments in other properties, that more paying mines might be developed, as they undoubtedly would be if properly explored. There is no use trying to evade the fact that the mining country which is most talked about, and whose merits are substantial and the best presented to the public attention, is the region where mining capital will go. This capital, in turn, will open up the country and make a fact out of what was before but a promise. By reason of the lethargy of mining men in Utah about giving the public such facts as would draw here the attention of the world, the mining boom is likely to come here the last of all; when other camps of less permanence have been exhausted, and when the merits of the country will absolutely force themselves upon public attention. We advise, therefore, the smothering of jealousies and suspicions, and a united effort all along the line to truthfully set forth the great richness and probable permanence of the mines of Utah; the developments made from week to week or from month to month; the mining sales negotiated or in progress and the net result of the combined mining industry, at least once a month, from the mills and smelters. We can conceive of nothing which would so quickly bring Utah into its proper place in the public mind as a faithful carrying out of those suggestions, and adherence to them.

To this we may add, incidentally, that there is nothing like aggregation for these presentations to have their combined and appropriate effect. To this end we proffer the use of the columns of the *Tribune* for the purpose herein advocated. This is the great mining journal of the interior. To it men naturally turn to get the information they desire about the mining industries of the inner mountains. A proper showing massed in its columns, such as mining men might make at no cost to themselves and with very little trouble, would form a record which would surprise the world. Suppose you try it, gentlemen.

IMITATION GROUND GLASS.—A very useful kind of varnish is made known by Leon Vidal, which is excellent for producing imitation of ground glass, and will doubtless be found available for other purposes. The formula is: Sandarac, 18 parts; mastic, 4 parts: ether, 200 parts; benzol, 80 to 100 parts.

MONTANA expects to ship 2,000,000 lbs. of wool down the Missouri river this year.

Interior view of Dewey & Co's Office. 202 Sansome St., S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons, and our success and business are constantly increasing.

The ablest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

BOILER COVERINGS.

Plastic Cement and Hair Felt, with or without the Patent "AIR SPACE" Method. Cement ready for use by the barrel.

G. C. FOWLER, No. 413 Pacific St., S. F.

PATENT ADJUSTABLE FIRE GRATE.

It surpasses all other Grates for convenience and economy in use of fuel. No stove complete without one. It will pay for itself in one week. Manufactured by

KEARNS & CALDWELL, 901 Shotwell St., S. F.

HUNTINGTON'S

Oscillating Stamp Mill

It has no Stems, Cams, or Tappets, and Adjusts Itself to the Wear of the Shoes and Dies.

For Simplicity, Economy, Durability and Effective Working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power.

Awarded First Premium and Medal at Mechanics' Fair, San Francisco, 1880.

MANUFACTURED BY

F. A. HUNTINGTON, 220 Fremont Street., S. F. California. | FRASER & CHALMERS, 145 Fulton Street, Chicago, Illinois.

Improved Patent Grinding and Amalgamating Pans, Concentrators and Gold Amalgamators; also, Steam Engines and Mining Machinery of all kinds.

Send for Circulars.

F. A. HUNTINGTON,

220 Fremont Street, San Francisco.

SIEGLER SPRINGS HOTEL,

Lake County, California.

JOHN SPAULDING - - Proprietor.

GOOD HUNTING AND FISHING

Right at hand for the accommodation of invalids. Baths of any desired temperature.

The Seigler Springs stage will connect with the stage from Calistoga at Lower Lake on Monday, Wednesday and Friday; at Glenbrook on Tuesday, Thursday and Saturday. Time from San Francisco, 12 hours.

These Springs have no equal in the State for speedily and permanently curing Rheumatism, Gout, Stiff Joints, Dropsy, Scrofula, Skin Diseases, Gravel, Diabetes, Female Diseases, Dyspepsia, Catarrh, Chronic Dysentery, Chills and Fever, Lead Poisoning, Painters' Colic, Constipation of the Bowels, and all Diseases of the Stomach and Liver, Bright's Disease of the Kidneys, and Impurities of the Blood.

The Hotel will be kept open summer and winter, the water proving equally efficacious the year round.

Address all communications to "Siegler Springs," Lake County, Cal. W. T. GARRATT, Manager.

ST. DAVID'S,

A FIRST-CLASS LODGING HOUSE

CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from $2.50 upwards

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

ANDERSON'S SPRINGS,

LAKE COUNTY, CAL.,

Nineteen Miles from Calistoga.

Hot Sulphur Water for Rheumatism, Paralysis, etc. Cold Sulphurs for Diseases of the Bowels and Stomach Climate Beautiful; Scenery Magnificent; Abundance of Trout Fishing; Good Cooking. Board, $10 to $12 per week.

ANDERSON & PATRIQUIN, Proprietors.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

245,755.—WAGON BRAKE—J. C. Walker, Helena, Montana Ter.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

AIR-COOLING AND PURIFYING APPARATUS.—Hugh J. Dykes, assignor one-half to Frank Shay, San Francisco. Dated Aug. 16, 1881. No. 245,614. This invention is intended for cooling and purifying air, to be used in sick rooms or in sleeping rooms. It consists in the employment of a rotating cylinder mounted upon suitable supporting rollers and having its interior subdivided so that one compartment may be filled with a refrigerating compound, while air may driven through the other part so as to pass over the cold surfaces and thus have its heat abstracted. It may pass over or through lime, lime water, or other material, by which it will be freed from its carbonic acid and other impurities, and it may be returned into the room to be used over again. The air is caused to circulate by the movement of a rotary fan blower or other air forcing apparatus, which is driven by means of a clock work or other mechanism, and draws the air into the room, passes it through the cylinder, and returns it to the room again. An apparatus of this kind would have been useful in the room of President Garfield during the late hot weather.

VALVE MOTION AND GOVERNOR.—W. L. B. Collins and L. L. Barrett, Vacaville, Solano county, Cal. Dated August 9, 1881. No. 245,351. This invention relates to certain improvements in valve motions and governors for steam engines; and it consists in the employment of peculiar double balance valve and cut-off in combination with a governor which regulates the action of the cut-off valve, while the main valve is actuated directly from the engine shaft. This cut-off valve is connected with the main valve by springs so as to move with it when not acted upon by the governor. The governor moves a cam, and through a connecting lever intercepts the cut-off valve stem at the point where the main valve opens so as to admit steam to the cylinder during a part of the stroke of the piston, which will be determined by the action of the governor and cam. At the proper time the cut-off valve will be released and the springs act to throw it forward and instantly close the port.

FLANGE CONNECTION.—Irving M. Scott, S. F. Dated, Aug. 9, 1881. No. 245,403. This invention relates to an improved flange connection for joining the ends of pipes, and it consists in providing the ends of the pipes with peculiarly-shaped flanges and securing them with peculiarly-formed bolts. Pipes are ordinarily connected by bolts driven through simple flanges, and the bolt holes on each have to correspond. This is inconvenient when a length of pipe has to be connected with one already in place, because its position may render it impossible to make the bolt holes correspond. The object of Mr. Scott's invention is to provide such an intermediate connection as will permit the pipes to be easily joined in whatever position desirable.

BED BOTTOM.—B. F. Farrar, San Francisco. Dated Aug. 16, 1881. No. 245,709. This invention relates to certain improvements in that class of bed bottoms which are comprised of combined springs and longitudinal slats. The improvement consists in the combination of certain devices by which the bed bottom and side bars are united by a continuous web, and the bed bottom adapted to be taken apart for the purposes of transportation.

AUTOMATIC STOCK FEEDER.—Isaac L. Deas, Petaluma, Cal. No. 245,795. Dated Aug. 16, 1881. This invention relates to a novel device for watering and feeding stock at stated intervals whereby, without the intermediate supervision of anyone, the required amount of food and water will be deposited in the manger. It consists of a peculiarly constructed receptacle, having a bottom or door in two parts, each secured by peculiar latches, said latches being connected with two alarm mechanisms of a clock, so that at the desired time the latches may be tripped and the feed deposited in the manger. It consists further in the employment of appropriate mechanism, operated by the bottom of the box in its fall, and connected with a receptacle or tank for water alongside of the manger, in which tank a common floating ball operates to regulate and close the flow of water.

HEADER ATTACHMENT FOR HARVESTERS.—Franklin R. Allen, Modesto. Dated, Aug. 9, 1881. No. 245,337. Mr. Allen's invention relates to an attachment for a combined header and thresher; and it consists in the construction, hinging and balancing of the frame which carries the sickle and main draper, in such a manner as to permit it to be easily raised or lowered for high or low grain, the movement of the attachment being made independent of the main frame. It is specially adapted to be attached to such a combined harvester and thresher as was patented in U. S. patent, No. 198,522, on which the heavy frame of the header is not moved with the hinged frame, the latter being moved alone.

PICK.—Thos. Williams, White River, Tulare county, Cal. Dated Aug. 16, 1881. No. 245,684. This improvement in picks consists in a novel means of securing and adjusting the points within the head, and in a peculiar construction of said heads for the reception of the points.

News in Brief.

THE mania for gambling in grain is spreading in the East.

ALBUQUERQUE, N. M., is to be supplied with coal from Arizona.

THE Colton cannery pays out $5,000 a week for fruit and wages.

THE Central Pacific railroad is replacing its iron rails by steel ones.

THE estimated surplus grain for export this season will reach 300,000 tons.

AT Seattle, W. T., the run of salmon has begun, and promises to be very large.

THE duty on the railroad iron brought to San Diego by the *Trafalgar* a few days ago was $71,800.

THE Chinese at Modesto have organized among themselves what they claim to be a Lodge of Freemasons.

THE subscriptions to the public monument to Beaconsfield amount to only £5,000, which disappoints the committee.

JOHN EVERETT MILLAIS has been appointed a trustee of the National Portrait Gallery, in place of the late Dean Stanley.

THE Almaden Mining Co. are storing 2,700 tons of English stone coal. A number of teams are engaged in hauling it from San Jose.

THE worst water famine ever known in Richmond, Va., now prevails. The workshops are closing, and even residents are without water.

A GIGANTIC acid tank was set in place at the Lyon Mill and Mining Co's. works last week. It holds 2,780 gallons, and took 2,780 pounds of lead to line it.

ENGLAND still watches actively the movements of North Africa. The prompt action of the ship *Monarch* respecting the outrage on the Susa is much approved.

A BASKET left at the Midland railway station, in London, by two men who immediately decamped, was found to contain a large quantity of gunpowder and cartridges.

THE pine, oak and cedar forest of Northern Arizona are very extensive, and if placed together they would cover a tract of land 350 miles long by 60 miles in width.

THIRTY-FIVE hundred men are at work on the line of railroad between The Dallee and the Cascades, and it is expected the line will be completed by the end of September.

A VIENNA dispatch says the excessive rains in the last few days have damaged the harvest in many places, and in the districts of Laibach and Corinthia it is entirely destroyed.

THE military authorities have been ordered to prepare flying detachments to proceed to different parts of Limerick county at a moment's notice, as disturbances are anticipated.

A DRUNKEN man at Buffalo fooled with two of the "brushes" in an electric light generator and was picked up dead. Fully a dozen men have been killed about electric lights in the past year.

SINCE the Eureka and Colorado railroad has become a fixed fact, property along the proposed route has advanced enormously in price. Ranchos that could have been purchased for $5,000 and $10,000, two weeks ago, are now valued at $100,000.

THE New York brewers, among their answers to the interrogatione of the Temperance Society about the modes of manufacturing beer, admit that they often use instead of barley malt, such substitutes as cornmeal, cornstarch, rice, grapes, sugar and glucose. They added: "We will discontinue the use of these so soon as your society shall show them to be deleterious."

THE *Leader* has information that a movement is progressing in official circles to have Vennor of Canada supersede Hazen as chief of the Signal Service. Prominent military men and scientists are said to be interested.

THE business portion of the town of Sebastopol, Sonoma county, was burned Sunday night. The fire originated in S. B. Berry's livery stable, and destroyed nearly all the buildings on the east side of Main street, and several on the west side.

THE recent heavy rain storms and washouts have somewhat delayed the extension of the Southern Pacific railroad toward Galveston, but work is being pushed forward with great activity in spite of the elements and unfriendly litigation.

SOME very important coal discoveries have recently been made in King county, W. T. Two different parties have discovered anthracite coal, the veins being clearly defined and the coal of fine quality.

EGYPT drifts toward a military despotism. The worst kind of insubordination on the part of the soldiers is stimulated by the Khedive for his own purpose. England has already intervened in this matter.

AFTER the students' "rush" at Berkeley on Wednesday, a number of the students adjourned to a beer saloon of a man named Bachman, and indulged very freely. President Reid quickly made his appearance on the scene and dispersed the gathering, and then proceeded to swear out a warrant against Bachman for violating the law, which forbids liquor to be sold within two miles of the University.

MINING AGENCY.—Mr. James A. Mars, who for many years was manager of the California Assay Office, has established a very comprehensive agency for the purchase and sale of mining properties, having branch offices in the principal cities of the Atlantic States and in Europe. Mr. Mars' familiarity with our mining interests, has been acquired by long experience and personal examination. As will be seen by Mr. Mars' card, which appears in our advertising columns, his name receives the endorsement of leading mining men, capitalists and banks; and these names will be sufficient guarantee to those who know them that Mr. Mars' capacity and probity must be unquestioned to receive their sanction. This also indicates that his promises to purchasers or owners will be fulfilled. The attention of those having mines for sale is called to the card. One of the commendable features of this enterprise is, that the investor shall have his mines examined by experts of his own selection.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. F. OSBORNE—San Francisco.
G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Yuba and Sutter counties.
D. W. KELLEHER—San Mateo and Santa Clara counties.
C. E. WETMORE—Alameda county.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct, or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F.D., at this office.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We will send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

$40 RIFLE FOR ONLY $15.—The Evans 20-shot Sporting Rifle, advertised by E. G. Rideout & Co, 10 Barclay street, is a great bargain We are positively assured that the retail price of these Rifles was $40 each; any one can get the same Rifle now by sending to the above named firm only $15. They offer to refund the money sent if the Rifle is not as represented. Read their large advertisement in this issue.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

BY TELEPHONE.—Subscribers, advertisers and other patrons of this office can address orders, or make appointments with the proprietors or agents by telephone, as we are connected with the central system in San Francisco.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

DIVIDEND NOTICE.

OFFICE OF THE

Eureka Consolidated Mining Company,

Nevada Block, Room 37, San Francisco, Aug. 15, 1881.

At a meeting of the Board of Directors of the above named Company, held this day, a dividend (No. 70) of Fifty (50) Cents per share was declared, payable on Saturday, August Twenty-seventh (27), 1881. Transfer books closed until the Twenty-ninth (29) inst.

W. W. TRAYLOR, Sec'y.

Consolidated Virginia Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given that, at a meeting of the Board of Trustees, held on the twenty-second (22d) day of August, 1881, an assessment, (No. 16) of Thirty (30) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, 309 Montgomery street, Room 26 (Nevada Block), San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth (24th) day of September, 1881, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on Saturday, the twenty-second (22d) day of October, 1881, at the hour of eleven (11) o'clock A. M., at the office of the Company, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. W. HAVENS, Sec'y.

OFFICE—Room 25, No. 309 Montgomery street (Nevada Block), San Francisco, Cal.

The Oxford Beta Tunnel and Mining Company.

Location of principal place of business, San Francisco, Cal. Location of works, Aurora, Esmeralda County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the Twentyseixth (26) day of August, 1881, an assessment, No. Twenty-nine (29), of Twenty (20) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Rooms of Dr. Knowles, 118 Dupont street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the Twenty-sixth (25) day of September, 1881, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the Seventeenth day of October, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A $40 Twenty-Six Shot Sporting Rifle for $15

AN EXTRAORDINARY BARGAIN.

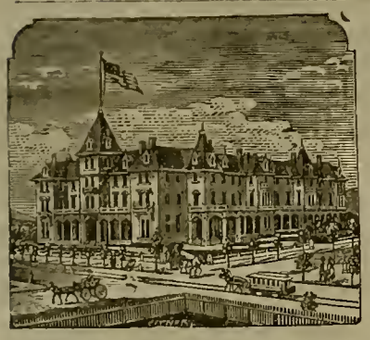
THE EVANS TWENTY-SIX SHOT MAGAZINE SPORTING RIFLE.

SHOOTS 26 SHOTS IN 60 SECONDS WITHOUT REMOVING FROM THE SHOULDER.

No hammer in the way. Throwing down the guard EJECTS LOADS and COCKS. THE EVANS is without exception the most accurate, longest ranged, easiest loaded, quickest fired, best constructed, simplest and most perfect breech-loading Rifle in the World. The new model and latest Improved EVANS MAGAZINE SPORTING RIFLE is exactly as represented in above cut. It is .44 Calibre, centre fire, 28 & 30 inch barrel, engraved black walnut stock, and sighted with graduated sights up to 1200 yards, at which distance it is more accurate than any Rifle in the world. The magazine which is located in the stock as shown in Cut Number 2, Contains 26 shots, or more than double the number of any other Repeating Rifle in the world. The working parts are ALL STEEL of the finest quality, case hardened and blued and the New Patent Locking Device makes it POSITIVELY SAFE TO CARRY when loaded. THE EVANS is a great favorite with sportsmen on account of the rapidity with which it can be fired, as well as for its accuracy at any distance from 100 TO 1200 yards. Owing to the failure of the Evans Rifle Co. we were enabled to purchase their entire stock of $50,000 worth of perfect Rifles for less than one-third the cost of manufacture, and as these beautiful and expensive Rifles cannot be made cheap enough to compete with cheaper Rifles, they will not be made again. This will be your last chance to secure one at the low Price of $15 and we pledge our business reputation that they cost to manufacture double what we ask for them.

UNTILL FURTHER NOTICE we will send one new model Rifle as above described carefully boxed for only $15 and when cash accompanies the order, will send a box of reloodable Metallic Cartridges and samples of the new phœnix 3 ball cartridge, a great invention in amunition with which three balls can be shot into a target incring at 50 yards. SEND MONEY by P. O. order or Registered Letter at our risk, or we will send the Rifle C. O. D. (collect on delivery) with privilege of examination before paying, upon receipt of $2.00; or your express agent's written guarantee that the Rifle will be returned free if you do not take it, but we do not send the Cartridges if sent C. O. D., as this is an extra inducement to those who send Cash With Order. WHAT IS SAID OF THE EVANS! UNSOLICITED TESTIMONIALS! "The Evans has been my constant companion for two years. I have shot 60 Buffaloes at one run, and pennies from between my wife's fingers, at 40 paces."—Kit Carson, Jr. "The Evans is simply immense. I am proud of it."—Joseph Arnold, Vice-president First Nat. Bank, Lockport, N.Y. "I have used the Evans in competition with the Sharp, Winchester, and Ballard, it beats them all."—J. Frank Locke, Burnamsville, Minn. "It shoots like a house a fire! I can clean out a whole band of Indians alone with it. I shall recommend them wherever I go."—Texas Jack. "It is the Strongest Shooting Gun I ever put to my shoulder, and as for accuracy it can't be beat. I know it to be the best Rifle in the market."—J. A. Boyd, of Yates' Sharp shooters. We guarantee every Rifle Perfect in every Respect.

THE EVANS SADDLE RIFLE, similar to the above, except a trifle lighter and 22 inch barrel, price $14, including swivels and straps. THE EVANS can be used as a single shot breech-loader and the magazine held in reserve if desired. Price of reloading tools for reloading shells, $4.00, former price $6.00. Evans cartridges can be reloaded many times. ORDER NOW, even if you have no use for a Rifle for some time to come. You will never get another such bargain and you can readily sell it for $30 to 40, and we hereby agree if the rifle is not exactly as represented to refund the money in every instance and pay you $5.00 for your trouble. SPECIAL OFFER.—Any one getting up a Club and sending us $80 will receive seven rifles. We refer to any Bank, Mercantile Agency, Express Company, or Newspaper Publisher in this City. ADDRESS E. C. RIDEOUT & CO., 10 Barclay St. N.Y.



TUBBS HOTEL,

East Oakland,

Having been Thoroughly Refitted and Refurnished, Painted and Frescoed, is now Open for the Reception of Guests. Rooms can now be secured at the Hotel.

IS. I. KELLOGG, PROPRIETOR.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,

SAN FRANCISCO, CAL.

Sanderson Bros. & Co.'s

BEST REFINED CAST-STEEL,

WARRANTED MOST SUPERIOR FOR DRILLS, HAMMERS, ETC.

A full and complete stock of this reliable and well-known brand of Steel, for mining and other uses, now in stock, and for sale at

4 to 6 Fremont Street, S. F. - H. D. Morris, Agent.

BOOKS, Relating to Casting and Founding, Electricity, Electric Light, Engineering, Drawing, Manufacture of Gas, Heat, Indicator Diagram, Link Motion, Mechanics, Screw Cutting, Steam Boilers, Steam Engines, Steel Turning Wire Gauge, Workshop Receipts. Descriptive Catalogue sent on application.

COKE. PATENT. COKE.
This COKE is exclusively used by Prof. Thomas Price, in his assay office, by the Selby Smelting and Lead Co., Prescott, Scott & Co, Risdon Iron and Locomotive Works and others in this city. Large supplies are regularly forwarded to consumers in Salt Lake and Nevada, to the Copper Queen Mining Co., Longfellow Copper Mining Co. and other consumers in Arizona.
The undersigned are in receipt of regular supplies from Cardiff, Wales, and offer the COKE for sale in quantities to suit purchasers.
BALFOUR, GUTHRIE & CO.,
316 California St., San Francisco.

VULCAN BLASTING POWDER.
—THE MOST ECONOMICAL AND BEST—
Nitro-Glycerine Explosive in the Market.
In the suit of the Giant Powder Co. against the Vulcan Powder Co. for *alleged* infringement of Patent, it was held that the Giant Powder Patent was INVALID.
Nos. 1, 2 and 3 Vulcan,
Each grade superior to like numbers of any other Nitro-Glycerine Powder in the market.
VULCAN B. B.,
Superior to Black, Judson or any low grade Powder for Bank Blasts, Railroad work, or any work where Black Powder has been heretofore employed.
TRIPLE FORCE CAPS AND ALL GRADES OF FUSE.
The CONSUMER'S COMPANY sell the best Powder at the lowest rates.
Office—218 California St., San Francisco.

Pacific Iron Works.
Established in 1850.
RANKIN, BRAYTON & CO.
Office—127 First Street, San Francisco, Cal.
Builders of Engines, Boilers, all Classes of Machinery.
PLANTS FOR GOLD AND SILVER MILLS,
Embracing the latest and most Improved Machinery and Processes for Base and Free Ores.
WATER JACKET SMELTING FURNACES,
For both Galena and Copper Ores of the Most Improved Construction.
Having Built nearly every successful working Furnace on the Coast, we are prepared to guarantee the best results attainable in all classes of Ores.
HOISTING AND PUMPING MACHINERY,
Embracing all Known Improvements.
WHEELOCK'S AUTOMATIC CUT-OFF ENGINE,
Beyond Question the most economical and perfect working Engine now made.
WALKER'S COMPOUND STEAM PUMPS,
The best in use. W work with thirty per cent. less steam than any other Pump in the market.
Sole Agents for HOWELL'S IMPROVED WHITE FURNACE.
The only successful Chloridizing Furnace made. Over fifty of them in use on this Coast.
Parties Wanting any kind of Mining Machinery are requested to send for Illustrated Circular.

William Hawkins,
(SUCCESSOR TO HAWKINS & CANTRELL).
MACHINE WORKS,
210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.
Manufacturer of
IMPROVED PORTABLE HOISTING ENGINES,
FOR MINING AND OTHER PURPOSES.
Also of the HAWKINS' PATENT ELEVATOR HOIST, for Hotels, Warehouses and Public Buildings.
Steam Engines and all Kinds of Mill and Mining Machinery.

L. C. MARSHUTZ. T. O. CANTRELL.
National Iron Works.
Northwest Cor. Main and Howard Sts., San Francisco.
MANUFACTURERS OF
IMPROVED PORTABLE HOISTING ENGINES.
Stationary and Compound Engines, Quartz Crushing and Amalgamating Machines, Flour, Sugar and Saw Mills.
SOLE MANUFACTURERS OF
Kendall's Patent Quartz Mill, National Ore Feeder & Concentrator.
CASTINGS AND FORGINGS OF EVERY DESCRIPTION.

THE RISDON IRON AND Locomotive Works
Corner Beale and Howard Sts.,
SAN FRANCISCO, CAL.
W. H. TAYLOR, Pres't. JOSEPH MOORE, Sup't
Builders of Steam Machinery
IN ALL ITS BRANCHES,
Steamboat, Steamship, Land
Engines and Boilers,
HIGH PRESSURE OR COMPOUND.
STEAM VESSELS, of all kinds, built complete with Hulls of Wood, Iron or Composite.
ORDINARY ENGINES compounded when advisable.
STEAM LAUNCHES, Barges and Steam Tugs constructed with reference to the Trade in which they are to be employed. Speed, tonnage and draft of water guaranteed.
STEAM BOILERS. Particular attention given the quality of the material and workmanship, and none but first-class work produced.
SUGAR MILLS AND SUGAR-MAKING MACHINERY made after the most approved plans. Also, all Boiler Iron Work connected therewith.
WATER PIPE, of Boiler or Sheet Iron, of any size made in suitable lengths for connecting together, sheets rolled, punched, and packed for shipment ready to be riveted on the ground.
HYDRAULIC RIVETING. Boiler Work and Water Pipe made by this establishment, riveted by Hydraulic Riveting Machinery, that quality of work being far superior to hand work.
SHIP WORK. Ship and Steam Capstans, Steam Winches, Air and Circulating Pumps, made after the most approved plans.
PUMPS. Direct Acting Pumps, for Irrigation or City Water Works purposes, built with the celebrated Davy Valve Motion, superior to any other Pump.

CALIFORNIA
Electric Light Company.
Owners of the Brush System of Electric Lighting for the Pacific Coast.
Apparatus for sale for Mines, Mills, Manufactories, etc.
Plating Machines and Machines for testing Ore manufactured to order.
Electric Light furnished on all the principal streets of the city.
Office—No. 119 O'Farrell Street,
SAN FRANCISCO, CAL.

QUICKSILVER.
THE CELEBRATED A BRAND, SHIPPED
DIRECT FROM THE
NEW ALMADEN MINE,
For sale in any quantity by the producers. Car Load Lots will be shipped from San Jose for Nevada, Arizona and the East, or delivered at Pacific Mail Steamship Company's Wharf, San Francisco, without charge.

Howell's Improved White Roasting Cylinders.
REVOLVING CYLINDERS AND ORE DRYERS.
Hoisting and Pumping Machinery.

THE O'HARRA
CHLORIDIZING FURNACE.
Patented in 1878.

SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

—o—

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1.10 per ton to work 40 tons in 24 hours.

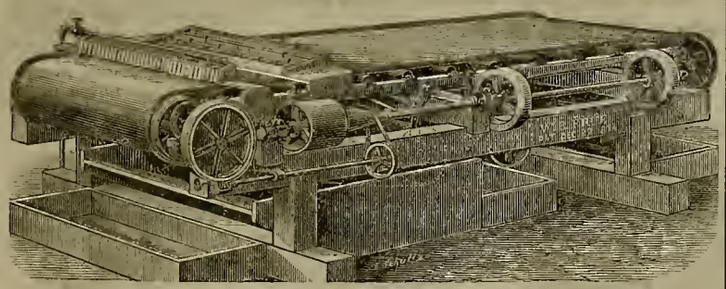
At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61½.

Lewis Chalmers, of the Isabella G. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenual sulphurate of silver up to from 84% to 95% of the assay.

SEND FOR DESCRIPTIVE CIRCULAR TO

WHITNEY, VEASEY & CO.,
Carson City, Nevada.
Agents for San Francisco, KUSTEL & CO., 318 Pine Street.

$1,000 CHALLENCE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of **$1,000** each, and we mean business.

☞A machine with all improvements can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents. Room 7 No. 109 California Street, S. F.

PATENT
LIFE-SAVING RESPIRATOR
Prevents Lead Poisoning and Salivation.

INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

Awarded First Premium at Every Fair of the Mechanics' Institute for the Last Twelve Years.

Excelsior Blasting Powder,
—MANUFACTURED BY—
THE EXCELSIOR POWDER COMPANY.

—o—

This is no NEW PATENT NON-EXPLOSIVE SAFETY POWDER, but the GENUINE STANDARD ARTICLE, and as safe to use and handle as any Nitro-Glycerine Powder manufactured. The Fumes and Gases, common in other Nitro-Glycerine Powders, are almost destroyed, and do not leave the miner with headache or nausea. Among the numerous recent testimonials the following is but a fair sample, constantly received, attesting the superiority of EXCELSIOR POWDER:

AUBURN, Cal., May 26, 1881.—EXCELSIOR POWDER CO.: I send you, per Wells, Fargo & Co., a box containing samples of country rock through which I am running our tunnel on the Conrad Mine, and through which we have now run 425 feet, 2/5 feet of it having been done with EXCELSIOR POWDER. If any one can produce harder rock I would like to see it. I here say that I can do more execution with your No. 2 Powder in this rock than I can with any No. 1 Powder of any manufacture I have ever used, and I have used every kind now manufactured here, excepting "Tonite," and I have had 20 years' experience in blasting. Respectfully yours,

E. W. ROBERTS, Superintendent.

Give this Powder a trial and you will use no other. For Strength and freedom from noxious fumes, it has no equal. Address all orders to EXCELSIOR POWDER CO., No. 330 Pine Street, Rooms 53 and 54, Academy Building, San Francisco, Cal.

THE PIONEER IN MIXED PAINTS. Is prepared ready for immediate use, and of any shade or Color desired. Any one who can handle a brush can apply it. It is impervious to our damp atmosphere, and is equally as good on Wood, Stone or Iron Work.

It does not **Crack, Chalk or Peal Off**, but retains for years that beauty of finish for which it is so justly celebrated.

Sample Cards of Colors, Testimonials and Price List furnished free, on application to

O. S. ORRICK, General Agent for Pacific Coast,
403 Market Street, - - - - - Opposite Front, San Francisco.

Miners, Attention.

With the approach of winter, the dangers which attend the handling and use of all Giant Powders (Nitro-Glycerine mixtures) are increased.

The lives annually sacrificed in thawing or using frozen cartridges, should be a warning to all to abandon Powders which freeze at 42° Fahrenheit. All Nitro-Glycerine Powders freeze at that temperature, and now for the first time Miners on this Coast have an opportunity to

AVOID THESE DANGERS.

Tonite Never Freezes!

It is Always Ready for Use, as well in the Mountains as at the Tropics.

VOLUME XLIII Number 10

Cable Railroads.

History of the Growth of a California Invention.

Description of the Wire Rope System for Street Cars.

It is not very long ago since the mode of navigation through the streets of large cities was by means of sedan chairs, and to-day the jinrikisha is the mode of locomotion through the principal cities of Japan. The street railway is a modern invention, and can be traced back to a very recent period, for, previous to 1850, street railways were not in use, and it was about that date they were first introduced in the United States, and for many years they were enjoyed only in the country, and their success, pecuniarily or otherwise, soon caused their adoption in nearly all the leading cities of Europe.

Yet the idea was not new, for tramways were in use early in the 17th century; but the tramway of that date was a very different thing to the street railway, or tramway as it is called in Europe, of the present time. There is little new under the sun, and when the Romans paved the way for the wheels of their chariots to roll on, or smooth roads were made for people to tramp on, they were but the precursors of tramways, or trampways, and long before Mr. Outram, by a singularity of connection of name and subject, suggested the practical tramway of the pre-railway period.

Yet it is unfair to say that the street railway of to-day is an old idea revamped, because some one had an idea that something of the kind might be done in some kind of a way. Break the eggshell and stand it on its end, and everybody will tell you they knew that before.

But long before

Street Railways Came into Fashion,

Stage coaches lumbered along pretty fair roads for the time, and each took the ruts of its predecessors, and thus had a tramway of its own, with a hollow rail of Mother Earth to run on. But in these days everything ran or walked on the king's highway, and it was not then the trampway as it is to-day, when tramps ruleth the road.

But long before the street railway came into practical use, much had been done in the way of thinking about it, and various contrivances were invented, more or less impracticable, to facilitate the mode of passenger traffic in streets, and to render it easy, rapid and cheap; but it was a long time before the old rumbling omnibus was supplanted by the horse cars of to-day, which have in their turn been, to a threatening extent, supplanted in New York city by the elevated railroads, and in San Francisco, 3,500 miles west, by the cable railroads.

It is the Cable Railroads,

More particularly, that we are now interested in, and which threaten to revolutionize the street railroad system, and to abolish the horse cars, and to the history of this invention we now propose briefly to turn our attention, and look back a little to see what had been done in this particular previous to the conception of the first cable road in this city—the Clay street hill railroad—by Mr. A. S. Hallidie.

Without wire ropes it would be difficult to work these cable roads economically and successfully. Wire rope was the invention of Mr. Andrew Smith, a native of Scotland, who experimented with the use of metal wire for ropes in 1828, and took out his first patent in Great Britain, January 12, 1835. Since then the material from which wire is made has been improved until now steel wire is made capable of sustaining a tensile strain of 120 tons per square inch area.

Steps of Progress.

As far back as 1812, W. and E. K. Chapman of England proposed to stretch a chain along the road, made fast at both ends, and to place on the carriage to be moved a grooved wheel, around which the chain was wound, and by turning the wheel propel the carriage.

In 1834, Wm. Jaines of England proposed to employ hollow rails as receptacles for a moving chain, and to attach, by any convenient mode, carriages thereto.

In 1846, E. W. Brandling of England proposed to place on the road a rectangular box, secured to the track, under the carriage, in which were four rails on which ran four wheels. A rope was used and a prong was projected from the carriage into the box, which, by twisting, compressed two boards over the moving rope, and thus hauled the carriage along.

In 1858 E. S. Gardner, United States, proposed a tunnel with a slot along its length, with a rope running on sheaves. He does not show any mode of connecting the rope with the car, and says the mode of connection is immaterial.

In 1859, Messrs. Foster and Brown, United States, proposed to employ an endless traveling rope, supported overhead by arms attached to posts. A catch or grab is attached to the car of a street railroad; a spiral spring intervenes between the car and the catch. When it was desired to start the car, the catch takes hold of the overhead rope. This is very similar to Beauregard's patent of 1869. (See Fig. 1.)

Robert and William Hawthorn, of Great Britain, in 1863, proposed to actuate, by means of a traveling wire rope, a number of wheels placed between the tracks and the carriages. The carriages were to be provided with draw bars, which were lowered so as to come in contact with the revolving wheels, and thus move the carriages.

In 1864, Mr. A. C. Bach (now of the *Scientific American*) proposed to move street cars by a chain with peculiar links running on a grooved rail and connected to car by a simple arm. The chain had friction rollers attached. He also combined the brake with the connecting device, to insure co-operative action. (See Figs. 2 and 3.)

[CONTINUED ON PAGE 153.]

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Mineral Park Mines, Arizona.

Editors Press:—The Atlantic and Pacific R. R., now building through northern Arizona, opens to civilization and settlement a vast area of country rich in timber, coal and precious metals, and much of it well adapted to stock raising.

This region which, owing to its inaccessibility has so long remained *terra incognita*, is blessed with an incomparable climate and stands unrivaled among all the Territories for the grandeur of its scenery. But the feature which above all others recommends it to capital and enterprise, is its mines of gold, silver, copper and lead. Quartz mines everywhere require money (which the original locators seldom possess), to develop them and reduce the ores. Cheap Transportation and Quick Transit In this age of progress is a first requirement of investors. The bonanzas of Tombstone were unworked and unknown until the Southern Pacific brought capital and cheapened material. In Mohave county, the Atlantic and Pacific is destined to build up "camps," rivaling Tombstone in prosperity and importance. Passing through the coal region in northeastern Arizona, the road crosses the "Black Forest" and the pine belt of the San Francisco mountains and enters the silver district at Hackberry, 100 miles further west. Running thence down the Hualapai valley, it skirts the eastern base of Cerbat Range within 12 miles of Mineral Park, the county seat, from which point, within a radius of eight miles, there are more than 2,000 mining locations, many of them showing large bodies of ore—gold, silver, argentiferous galena, and copper carrying both silver and gold. Embraced within this area are the camps of Chloride, Cerbat, Todd Basin and Stockton, all within 15 miles of the railroad survey. Each of these camps has supported since 1871 a goodly population of

Miners Who Have Held Their Claims

Year after year with firm belief in their future value. During this time prices of provisions and material have been higher than in any other mining district in the United States, and the cost of shipping or milling ore so great that nothing less than $200 per ton left a margin to the miner. And yet, these men have lived comfortably on the product of their mines, and in many instances made a handsome surplus. None of the mines are prospected to a depth, most of the ore having been taken from the "croppings" where it could be mined at the smallest cost. To give an idea of the character of the vein formations, etc., it will be necessary to describe some of the locations in each of the above named camps. Leaving the other points for a future letter, I will close with a brief description of some of the

Stockton Mines

On the east side of the Cerbat mountains, eight miles by good road from the line of the railroad survey, and 20 miles by same road from an inexhaustible supply of fine timber. The average of all ores milled from Stockton is above $300 per ton in silver. The formation is feldspathic granite with dykes of true porphyry forming one wall of many veins. The strike of the main lodes is northwest with many smaller strata putting into them at various angles, and generally with an obverse trend. These small strata are frequently very high grade, and the difference in dip indicates that they are feeders to the large veins. The Cupel mine has 150 tons of ore on the dump worth $100 per ton. It has produced $150,000 from ore already milled. There are but 330 ft. of shafts and drifts from which, and open cuts, the ore was taken. Work just resumed, shows in bottom of 130-ft shaft 12 to 16 inches of ruby silver ore worth $400 per ton. The Franklin mine is a 30-ft. vein. The last ore from a 2-ft. pay streak milled $476 per ton silver, and 62% lead. The Little Chief has netted its owners $8 per day for all work put upon it. There are 600 ft. of shafts and drifts, and considerable stoping has been done. Value of ore from $600 to $1,500 per ton. The group of 8 mines owned by Robert and Thomas Gray are especially worthy of mention, lying within a radius of one mile and all accessible by the same road, they possess advantages for economical working as well as in quality and quantity of ore seldom equalled. Beginning with the Silver Monster, near the summit of the mountain, 1,500 ft. above the valley, we find the immense croppings of the Cincinnati mine, owned by the Fairfield Co., extending 800 ft. on this ground, and assaying from $30 to $180 per ton. A shaft 60 ft. from the north boundary shows at a depth of 50 ft. 10 ft. of fair milling ore. At 110 ft. the shaft and a crosscut now in 6 ft., is wholly in clean ore, averaging $50 to $60 per ton. The vein is perpendicular. The Miners' Hope, on the same ledge, has two shafts 20 ft. and 35 ft. deep respectively, which have produced 30 tons of ore milling from $160 to $375 per ton. The vein has an even width on this claim of 15 ft., with smooth walls of porphyrite. The casing of taloite is wholly on one side, leaving the ore on a hard wall—a good indication of permanency in an ore body. Lower down the mountain is the Blue Bell, a 12-ft. vein, with several feeders in close proximity. The deepest shaft is 40 ft., and has produced 40 tons of dressed ore, part of which sold in San Francisco for $260 per ton, 30% being gold. The ore streak averages 4 ft. in shaft, and good ore is traceable the whole length of the claim, 1,500 ft. The northwest extension, known as the Fremont and owned by a Chicago company, has produced considerable ore, milling as high as $650 per ton. The Fountain Head, belonging to the same group of mines is 15 ft. between hard, smooth walls. It carries 40% lead and shows ore for 1,000 ft. on the croppings. The average of the ore streak where opened is 2 ft., assaying, dressed, $70 in silver. The Pure Metal is an extension of the Capel mine. It is perpendicular and 4 ft. between walls, carries 50 ozs. silver and 60% lead; pay streak from 1 to 2½ ft. thick.

The Tigress is the last of the group worthy of mention. It contains only 600 linear ft., is 12 ft. wide, with an ore streak 1 to 2 ft. thick, milling, dressed, from $150 to $400—30% lead. One hundred and fifty ft. of shafts and drifts have afforded 150 tons of ore without stoping. Ruby and native silver are found on the croppings. The lead increases with depth. This vein lies flatter than any of those before mentioned. The trend is 65°; hanging wall, a gneissoid rock; footwall, porphyry. Many other locations at this point show equally as good prospects, while others that have afforded much high-grade ore have been so gouged on the surface and carelessly worked, that it is difficult to judge of the appearance of the veins.

W. M. Ewing.

Mineral Park, Arizona, Aug. 13, 1881.

Poorman's Mining District.

Editors Press:—I herewith send you some notes in the belief that there must be many mining men who are looking anxiously toward this far-off section of the State, and who no doubt believe that increased railroad facilities will stimulate prospecting and mining in the mountains bordering the great desert and on the Colorado river.

Our camp is situated 15 miles west of the Colorado river, and also 15 miles north from the Southern Pacific railroad, with perfect natural roads to both places over hard, smooth mesa country, with no hills intervening. We are five miles east from the base of the Mesquit mountains, in some low foothills, the highest being less than 100 ft. in hight. The principal locations are on the Luz ledge, which is about 25 ft. wide, cropping up through the mesa for a distance of 7,500 ft., or five full locations. The contact nature of the vein is apparent at the first glance, for to the south pure gray granite is all that is visible so far as the low hills appear above the mesa, while north all is red and yellow porphyry. The ore is mostly milling silver quartz, but also carries galena of a good smelting quality. We have assays of the galena going 29 ozs., 87 ozs., 141 ozs., 186 ozs. silver, with about 6% lead, being all averages at the different depths; and from the quartz at the various levels and cuts has gone on an average 10.2 ozs., 12.4 ozs., 36.35 ozs., and 89.40 ozs. and 145.9 ozs. silver.

We now have an incline down on the granite foot wall on the Amelia mine to the depth of 65 ft., from which we have taken some six tons of galena and quartz. On the Paymaster mine we have a straight shaft on the vein about 15 ft. deep, from which we take the same character of ore; on the Boston there is some very fine carbonate of silver and lead; on the Florence Eaton we have still the same massive quartz outcrop, but no development. Next we come to the Luz mine, from which the ledge derives its name. Here we find the most work done, there being one 50-ft shaft, one 20 ft. and two each 10 ft., all on the ledge, but none of them being on either hanging or foot wall. From this claim several tons of galena were shipped to San Francisco between 1875 and 1878, since which time the camp has been abandoned on account of lack of transportation and the expensiveness of mining in general in this remote country at that time. But now all is changed.

We can now have goods of all kinds laid down almost at our very doors at a very slight advance on city prices; we can ship ore and get returns almost immediately; we are blessed with one of the finest climates in the United States, for nine months working in the open air is a pleasure, the mercury never getting down to the freezing point, and the other three months in summer all that is necessary for outside work is a good shade. We are not troubled with water in the mines, and for that reason very little timbering is necessary. Wood for fuel is plenty around the mines—iron-wood and palo verde, and on the Colorado river hottom all the cottonwood and willow necessary for building and other purposes. For water we have large natural tanks in the hills, four and seven miles from the camp, and when they give out, we pack water from the river without trouble.

There are about 25 claims located in the district, but only five or six of them are being prospected at present. Taking into consideration the situation of the camp, the well defined contact character of the ledge, the width of the ledge and the established character of the ore, we have some of the best properties in all this lower country. Arthur H. Douglas.

Poorman's Mining District, San Diego Co., Aug. 17, 1881.

California Gold Nuggets.

Editors Press:—I see in the Press of this week an interesting article on "Gold Nuggets," which gives the locality and value of foreign nuggets. I suppose in the continuation of the articles other nuggets will be enumerated; and desiring to add to the information on the subject, I send you a list of California nuggets. Part of these I mentioned in an article in the Mining and Scientific Press some years ago, but a number of others are here given. I may add that many of these nuggets I saw myself, and I have visited all the localities mentioned and gained the particulars, being interested, so that most of my information is from personal observation.

I will now commence with the different counties in which the nuggets were found:

Siskiyou County.—In a gulch near the Klamath river, a short distance above Groot's Ferry, some years ago, a nine-pound lump of almost pure gold was found; and at various times numerous smaller ones, weighing from a few ounces upward, have been discovered.

Trinity County.—In 1870, on Little Mule creek, near Minersville, in gravel diggings, two nuggets of solid gold were found, one weighing eight pounds, avordupois, the other about eleven pounds. In 1873, on Buckeye Mountain, so-called, a dry gravel ridge, lying between Rush Creek and Stewart Fork, two nuggets of solid gold were found, one weighing three and a half pounds, avoirdupois, the other nearly ten pounds.

Shasta County.—In 1870, on Spring creek, near the town of Shasta, in gravel diggings, a nugget of almost pure gold was found, which weighed fifteen pounds four and a half ounces, valued at $3,200.

Sierra County.—At French Ravine, at various times, large nuggets have been found. In 1850, a mass of quartz and gold, weighing about 36 pounds, over half of which was gold; in 1851, a mass of quartz and gold, worth about $8,000 besides numerous smaller ones, weighing a few ounces and more; in 1855, one of quartz and gold, valued at $10,000; in 1860, one worth $1,760, and in 1866, one was found valued at $1,575.

At Smith Flat, a short distance above the last locality: In 1861, a mass of quartz and gold worth about $1,500; in 1864, one weighing about 140 ounces, and with but very little quartz; in 1866, one weighing about ten pounds, most of which was gold.

At Forrest City: In the Live Yankee claims, from 1854 to 1862, twelve nuggets, some of them very interesting specimens, were found, weighing from 30 to 170 ounces each. The Oregon Co.'s claim, adjoining the last, furnished, between 1856 and 1862, numerous nuggets weighing from 30 to 100 ounces. In other claims in the vicinity numerous large ones have been found. In the Hope & Co. claims, four miles below the Mountain House, a nugget of almost pure gold, valued at $1,770, was taken out in 1864; in 1878, a nugget of gold was taken out of Bald Mountain, weighing five and a half ounces; also, another weighing fifteen ounces.

In Minnesota, Sierra county, at various times, numerous large boulders have been found, some yielding over $5,000. In 1869, a nugget of almost pure gold, worth about $2,000, was found at the Little Grizzley diggings. The same year the Monumental Q. M. Co., at Sierra Buttes, took out a piece of quartz and gold worth some $30,000, according to reports.

Nevada County.—At Remington Hill: In 1855, a nugget of quartz and gold, worth $3,500; in 1867, one worth about $2,400; and at numerous times various pieces, weighing a few ounces and more, have been taken from the same hill.

At Lowell Hill, in 1865, a mass of quartz and gold, worth about $1,100, was found, besides numerous smaller ones at different dates.

El Dorado County.—In the vicinity of Pilot Hill, various boulders of quartz and gold have yielded large amounts; one, in 1867, yielded about $8,000.

One of the most beautiful specimens of dendritic crystallized gold which has, perhaps, ever been found in the world of its size, was discovered in El Dorado county, and you gave an engraving of it some time since from a photograph by C. E. Watkins. It was found in a seam of decomposed quartz, between the slate, at a depth of about 60 ft. from the surface, in August, 1865, at what is known as the "Grit" mining claims, in Spanish Dry Diggings, El Dorado county, Cal. It weighs about 16 lbs., and is valued at $3,500. Although much larger nuggets than the one described have been found in this State and in Australia, so far as ascertained, none have been found presenting such a remarkably beautiful appearance. The gold branches out in the form of offshoots like the branches of trees.

Strange to say, this beautiful specimen was not retained in California, but was taken to Paris. It was exhibited at the Paris International Exposition, in 1868, and was much admired and appreciated by those who had the pleasure of seeing it.

This county has produced at various times numerous smaller nuggets from a few ounces to a few pounds.

Placer County.—In 1864, on the middle fork of the American river, two miles from Michigan Bluffs, a fine large mass of almost pure gold was found, which weighed 15½ lbs.

Calaveras County.—In the quartz claims at Carson Hill, numerous masses of gold, weighing from six to seven lbs., have been found. In November, 1854, a nugget of quartz and gold was discovered in this county, which weighed 195 lbs. Troy, valued at $37,400. This is the largest piece ever found in the State.

There is no doubt but that many other large masses of gold have been found in the State, and it is to be regretted that we have no full list. What a pity for the cause of science that *facsimile* casts of these nuggets were not taken at the time, so that they could have been preserved.

C. D. Voy.

Grafting Flesh.

We take from the account in the Oakland *Tribune* the following facts concerning the remarkable cure of Frank Leavitt, the locomotive engineer, who, it will be remembered was so severely scalded by the overturning of a locomotive near Leadville, Colorado, on the Denver and Rio Grande railway. Pieces of his flesh were so scalded that they were cut off by the surgeon. One piece was cut from his thigh 10 inches in length, and four or five in breadth. To repair this three of Mr. Leavitt's friends offered themselves to the surgeon's knife, and pieces of their flesh were cut off and grafted on to the wound. Mr. Leavitt was found seated in an easy chair by the window and gazing into the street. "After the accident," said he, "I was taken to South Pueblo, which is about 10 miles from Leadville. For about four days I felt little or no pain. Then

The Scalded Places

Began to hurt frightfully, and the doctors found it necessary to cut out a large piece of my thigh. Yes, the wound in places went clear into the bone, leaving a large hole. Dr. Craven and Dr. Christie, who were attending me, said that it was necessary to graft the open wound with new flesh and skin in order to build it up. You see, a small hole will naturally fill up and skin over without help, but this was too large to get along without some help. The doctors would have taken some of the flesh of my arm and use it, but that I was in a feverish condition at the time, and three of my friends who worked with me offered to allow the doctor to use them to help me out. How was it done, eh? Well, simply enough. The surgeons just took hold of the man's arm with a pincers, and pinched up a little piece of skin and flesh, not much bigger than a dime, as you may say, and then just slit it off with a knife. How many pieces? Well, they cut off from these three men twenty-seven of these small pieces altogether, but, of course, not at the same time. No, it

Didn't Hurt the Men

Particularly. These small pieces of skin and flesh were then taken and laid on separately on the wound—each one to act as a kind of center, you know, for the new skin and flesh to build up around. Of course, they wouldn't begin to fill up the wound, but each piece acted like a graft, and began to grow out toward the others until the intervening spaces were filled up. It took quite a long time to get all the grafts on. Some five or six were put on at one time, and it took them about three days to unite. Some of them did not unite at all, but fell off at the first dressing. No, I couldn't tell exactly when the pieces became a part of me, for I couldn't touch them because of the dressing and bandage. The pieces were just laid on the wound, and bound firmly on with a bandage smeared with some healing mixture or salve. When they didn't fall off on the third day, when they came to dress the wound, there they were and there they stayed, and that was all I knew about it. The place will never be filled up quite level, but it is perfectly sound and whole now, although a little raw and sore, of course, and I am able to walk about with a crutch, and I expect to be able to go to work in about three months.

As Well as Ever.

"The company has been very good to me. I have been on full pay ever since the accident, on the 3d of last May, and they gave three months' leave of absence on full pay to the men whose arms were cut. The accident happened on the 10-mile extension of the Denver and Rio Grande railroad, near South Pueblo. The grades are quite steep there, and the curves very sharp. We were coming down at a pretty good rate, and just rounding one of the curves, when of a sudden I felt the engine moving sideways under me, and then in an instant it went plunging down the steep embankment almost upside down, but not before I had time to clap on the air-wheels and reverse. This must have saved the lives of the passengers, for none of them were hurt much, and the fireman jumped off before the engine broke loose. At the bottom, I was found lying, pinned under the boiler-head, so I couldn't get out, but not crushed. The steam was escaping and burning my back and legs terribly. I shouted to them to pull me out, and they did pull for a minute or two, and then quit, thinking they would pull my arms out of the sockets. I did not care if they did, so long as they got me out of that, and finally they did drag me out more dead than alive. Yes, sir; I was 78 days in bed."

The assessment on Con. Virginia is the 16th to be levied by that corporation. The last one previous was levied June 11th, 1873. The mine has been assessed $411,200, and has paid 53 dividends, amounting to $42,930,000. The last dividend was declared Aug. 16th, 1880. The fifteenth assessment was levied June 11th, 1873.

MECHANICAL PROGRESS.

Steam Engines for Electric Lighting.

With the adoption of the electric light a demand has arisen for engines to drive the dynamo machines by which static electricity is produced. So far as we are aware, the chief design of engineers has been directed to making engines that will perform continuously at high velocities without heating, but it seems to us that this is only one function of such machine, and not the highest. Where the dynamo only is driven directly by the engine, fluctuations in speed are not so noticeable as where it is connected indirectly by a belt and the engine has other duties, such as driving elevators or other machines about the premises.

On account of the cost of electric lights produced by steam, it is essential that their engines should have high economy, which means an early cut-off as an element, doubtless occurring at some point previous to half stroke. As they are at present constructed, during the other half stroke they will show such changes in speed as variations in the load may induce. Therefore, an electric light engine should have such an excess of power that there will be sufficient stored in the fly-wheel to carry without sensible change of speed, any sudden increase of load that may occur when the steam is working expansively. Whether under these conditions it is cheapest to have a special engine for the dynamo, or one engine for both duties, it is not our intention to discuss. We do say, however, that it may be advantageous to so design engines for dynamos, in connection with other work, that they shall be able to increase their power during the expansion period, if an increase of load occurs to render it necessary.

Suppose, for example, that instead of the governor ceasing to control the valve after the point of cut-off, it is so constructed as to control it during the whole stroke.

Thus, expansion has commenced and a sudden increase of load occurs; would it be an advantage to gear the governor so that it would again admit live steam, thus increasing its power to drive the increase of load?

This would of course add to the fuel consumption, in order to proportion the engine to its load, but fuel consumption is only one of the elements in securing commercial economy. We present this question for the consideration of engine builders.—*Mechanical Engineer.*

Relations of Oil to Power.

The function of an oil, when used to lubricate, is to lessen friction, and the more perfectly it is done, the more thoroughly is its purpose accomplished. Exactly why oil should be a lubricant any more than water or a mucilaginous or emulsive body has not yet been determined, and what its molecular condition has to do with it is not yet definitely ascertained. Oil applied between two surfaces or bearings, fills the superficial pores of the metal, and forms a film between the surfaces, and thus keeps them apart, and the particles of oil are made to move amongst themselves and keep these surfaces from absolute contact.

Too little attention is paid by users of machinery to adapting the quality of the oil to the work to be done; for instance, the cotton or woolen mill which uses lard or so-called "heavy" oil on their engine and spindles, would find the latter absorbing or destroying much of the power of the former, simply in overcoming the resistance due to the viscosity or "heaviness" of the oil itself, for we must remember that the absolute resistance of the spindle is but slight; adhesiveness due to the oil itself, would almost equal the normal resistance of the unoiled spindle. Then, again, the tendency to gum or thicken of the oil in question, adds to its undesirability, and when we see this resistance multiplied by the thousands of spindles at work, we can imagine the drain of power simply in overcoming the resistance of the oil. Paraffine oils, and other refined derivatives obtained from petroleum, are peculiarly adapted for all this work—heavy or light—for by a judicious admixture of them with animal oils for the purpose intended, an oil may be obtained suitable for any work. In this class of oils the tendency to gum or oxidize is checked, as the petroleum holds in solution the other oils, and being non-evaporative and non-oxidizing itself, it imparts those properties to the oils in combination.—*Northwestern Miller.*

A NEW STEAM BOILER.—A recent Glasgow patent is for a steam boiler composed of two cylindrical shells, united end for end, but not upon the same axial line. One of these portions is situated over the furnace, and is externally fired; the other portion contains tubes, through which the products of combustion pass. The two sections are bolted together by strong bolts, extending through from the front to the rear end. The end which is externally fired is raised sufficiently high above the axial line of the other sections to allow the production of combustion to heat the crown sheet, and then pass off through the tubes of the second section.

A USEFUL packing for steam engines, pumps, etc., is at present being made by thoroughly incorporating paper pulp with plumbago, and subsequently forming it, under strong pressure, into sheets or rolls.

American Cast Iron.

Foreign engineers often speak contemptuously of some American works, says the *Mechanical Engineer*, because the details of them are cast iron, implying by this that they are neither strong in the first instance nor serviceable in the last. If American cast iron was the same in character as foreign cast iron, the objections noted might have some force, but it is so vastly different as to be virtually another metal. It is not only stronger per square inch of section, but the limit of elasticity is higher. Cast iron in English text-books is stated to have a tensile strength of 25,000 pounds per square inch, but American iron especially ordnance or gun metal, will stand 39,500 pounds to the square inch of section. This is of course a special mixture, but it is a result reached in cast iron.

By reason of this great strength of American cast iron, we are enabled to use it successfully in car wheels and for locomotive drivers. This is to the average English engineer an incomprehensible thing, as all, or by far the greater part, of the drivers and car wheels used there are wrought iron.

English locomotive cylinders fail much oftener by cracking than ours do, notwithstanding the fact that the nature of their road beds and uniformity of climate are vastly in favor of durability. It is possible, also, to use a greater degree of shrinkage in machine parts, so connected, with American cast iron than in English material of the same kind.

Whether the result thus obtained by American irons are due to their native purity as ores, or better processes of smelting, we do not propose to discuss here; it is the greater value of American cast iron as constructive material, compared with European cast iron, that we deem noteworthy, and as an explanation of its employment with us for important details.—*Boston Manufacturers' Gazette.*

FUSIBLE BOILER PLUGS.—At one time the safety of a boiler, so far as concerned any danger arising from low water, seemed reasonably well assured by the fusible plug. Experience has demonstrated, however, that this, like other so-called safety devices, is not to be depended upon. In some instances, the material of which the fusible portion of the plug is made seems to gradually lose its nature, or, more probably, the base of the metal gradually wastes away, its place being occupied by lime and other deposits, until it is well nigh impossible to melt it. In other instances, it becomes covered with scale and dirt, making it highly improbable that it will melt until the heat becomes dangerously high. So uncertain is it at what temperature such plugs will melt that as safety devices they are of little use.—*American Machinist.*

SCREW MANUFACTURE.—One of the most interesting of mechanical processes is the making of screws. The wire in large coils is made, by being drawn through a hole smaller than itself, the size required. It is next introduced to a machine, which at the same time cuts off the desired length and "puts a head on it." It is next put into sawdust and "rattled" and brightened. The head is then shaved down smoothly and the nick made. Now comes another "rattling" in the sawdust, after which the thread is cut by a machine, and after again "rattling" and drying the screws are assorted by hand, grossed by weight and packed for shipment. This work is sometimes performed by curiously devised automatic machinery.

IMPROVEMENTS IN ROLLING IRON.—Much ingenuity has been brought into exercise by iron workers in devising means to obviate the great exposure to heat and expense of manual strength required in handling the blooms of iron or ingots of steel between the furnace and final process of rolling into bars or rails. Mr. Chris. Lewis, formerly superintendent of the Locbiel Works, near Harrieburg, Pa., has recently invented and put in practical operation a system of automatic machinery, by the use of which the services of only one man are required to pass the heated steel ingot from the furnace through the entire series of rolls to the rail straightener.

IRON SHIP BUILDING IN AMERICA.—The *North American*, in speaking of iron ship building in America, says that, notwithstanding the business is treated lightly by New York writers, it is nevertheless making very steady progress. Every establishment on the Delaware river has been very actively employed for the year past, and the prospects ahead are quite satisfactory. Still the capacity of these establishments has never yet been fully tested, and if they all could get contracts as fast as they require them, they could easily turn out double the amount of tonnage they now do.

TO REMOVE GEAR WHEELS.—To get a gear wheel off a shaft, upon which it has been shrunk, take it to the foundry and pour some melted iron around the hub, and it will heat and expand so quickly there will be no time for the shaft to get hot, and the gear will come off easily.

THE rim of the homogeneous car wheel, as it is called, is cast from melted scrapa of wrought iron and steel. As soon as it has cooled sufficiently to "set," it is taken from the mold and placed in another, and the center piece is cast of the best wheel iron. The two metals are thus firmly welded together.

SCIENTIFIC PROGRESS.

The Tails of Comets.

Just at this time scientists are studying with much interest, and under unusually favorable circumstances, the peculiar phenomena connected with comets, and doubtless a large amount of new and valuable material in that direction will be presented at the meeting of the American Association for the Advancement of Science, now in session at Cincinnati. The most characteristic, and at the same time, the most inexplicable of all the phenomena connected with these bodies is the constitution and movements of what is known as their "tails." One of the latest and most novel theories advanced in regard to that appendage is that of Camille Flammarion in a paper recently read before the French Academy of Sciences, on the comet which has just disappeared from our view. The theory seems to come nearer to meeting all the conditions involved than, perhaps, any other hitherto put forth; yet, to accept it, we must admit that there are forces in nature of which we are yet ignorant. We copy, substantially, as follows:

In my observations on this comet I have devoted myself principally to an examination of its physical aspect. This examination appears to lead to conclusions which are different from the opinions generally adopted as to the nature of cometary tails. . . . The perfect transparency of these trains of light leads us to think they are *not material*, that they are not gases driven back into space by a repulsive solar force, but that they are an excitation—electric or otherwise—or either produced by the mysterious star, on the side opposite from the sun, we might almost say in the line of its shadow!

On the 24th of December, 1811, Piazzi observed at Palermo, through the tail of the celebrated comet of that year, the stars which, instead of being more or less obscured, were seen to be *more luminous*. . . . Apropos of these unexplained physical phenomena, let us dwell for a moment on the assuredly extraordinary circumstance which occurred last year, and which was only the renewal of one of the same kind observed already in 1843. On the 28th of January, 1880, the great comet discovered in the Southern hemisphere passed to its perhelion at 150,000 miles only from the solar surface.

The proximity was more surprising still on the 27th of February, 1843. The two celestial bodies brushed each other at 33,000 miles only—that is to say, the comet traversed the solar atmosphere at a light less than that of the corona, and even of that of the protuberances, several of which have been ascertained to measure 200,000 miles in hight. Now at these two epochs the comet was accompanied by a narrow and rectilinear train, which it carried with it always on the side away from the sun, and which stretched out 125, 150, and even 200 millions of miles in length. To make in two hours a half revolution of the sun, it rushed along with a velocity of within a fraction of 32 miles per second. Now at the distance of the earth, 95 millions of miles—a rectilinear and rigid tail must have swept space with a velocity of 3,716 miles per second. [The actual visible extremity of the tail of that comet, which extended into space many millions of miles beyond the earth's orbit, must have swept around at a rate of not less than 100,000 miles per second. An actual translation of matter at such a speed is absolutely beyond our conception, and cannot be admitted into any human philosophy.—EDS. PRESS.]

Does not this circumstance, which has presented itself to our eyes twice in 37 years, taken in connection with the perfect transparency of these trains of light, lead to the consequence that *the tails of comets cannot be material?* Is it an undulatory motion excited by the comet itself on the side opposite from the sun? We do not as yet know all the forces of nature.

Prof. Davidson's Views.

Previous to the announcement of the above, Prof. Davidson, of this city, read a lengthy paper before the California Academy of Sciences, in which the same theory as that announced by M. Flammarion was distinctly set forth. In studying the recent comet from his observatory in this city, in connection with similar phenomena previously noticed, the Professor has arrived at the following hypothesis:

"That whilst there may be matter emitted from the nucleus of a comet as necessitated by the development of the nucleus and the formation of the envelopes when the comet is approaching the sun; and that part of such matter may follow in the course of the orbit; yet the principal cause for the exhibition of the tail is this: That the light rays from the sun, in passing through the matter of the envelopes surrounding the nucleus (so intensely heated when the comet is close to the sun) become so changed in their wave-length, that the ethereal medium itself becomes luminous and visible in the prolonged line of their passage.

"In my judgment this hypothesis, or some modification of it, will account for many, and perhaps all, of the phenomena referred to, may embrace some of the phenomena of the corona of the sun, and even of the zodiacal light. It overcomes the hitherto insurmountable difficulty of the actual translation of matter at such enormous velocities."

This bold proposition opens a wide field for speculation, inasmuch as it takes the phenomenon from the scope of our terrestrial view, and gives it a cosmical breadth. Prof. Davidson is preparing a popular paper on the subject of comets, which will be looked for with much interest.

A NEW EXHILARATING SUBSTANCE.—Dr. Luton, of Rheims, calls attention in a French medical paper to the exhilarating properties of the tincture of ergot of rye when associated with phosphate of soda. The circumstances of the discovery were as follow: A woman of 62, at the infirmary of the *Maison de Retraite*, in Rheims, was receiving tincture of ergot of rye for disease in the knee. Fearing an unfavorable turn, the doctor thought to strengthen the action of that medicament with phosphate of soda, and accordingly combined a little of the two substances in a quarter of a glass of sweetened water. The patient, about three-quarters of an hour after taking this, surprised the inmates by bursting into loud laughter, without obvious reason, and this continued for more than an hour, with brief intervals. The laughter seemed to be associated with merry ideas, and to indicate a kind of intoxication. For some time after it died down the woman was in great spirits and good humor. Dr. Luton had not witnessed the scene, but the consequences to the patient being good, he administered the substance again, and a third time, observing the same effect. The experiments were further repeated on seven or eight women and girls with like results. In the case of men the action of the substance is less marked; it appears only in coloring of the face, giddiness and slight headache. The effects in question have probably a common origin, it is thought, with those from eating rye bread when, in rainy years, the cereal contains as much as 5% of ergot. A sort of intoxication is produced which the consumers by no means despise.

AN INTERESTING DISCOVERY has been made by Loew on the presence of free fluorine in fluorspar. As fluorine is the only element which, though well known through its compounds, has never yet been isolated, the matter deserves attention. A certain variety of fluorspar, of Wolsendorf, Bavaria, dark violet in color, has always been remarkable for its peculiar odor, and various theories have been advanced by scientists to account for it. Loew came to the conclusion that it might be free fluorine; and, to test his hypothesis, he ground a kilogram of Wolsendorf fluorspar with water containing ammonia, using small portions at a time, the filtrate and wash-waters from the earlier being used with the later quantities. The last filtrate was mixed with sodium carbonate, evaporated, the residue treated in a platinum capsule with sulphuric acid, and, covered with a watch glass, kept at 40 to 50 degrees for a long time. On examining the glass it was found to be very considerably corroded. Since fluorspar is not entirely insoluble in water, the experiment was repeated, using the inodorous mineral. The result was so exceedingly feeble as to dispose entirely of this objection to the former result. Since these dark radiated varieties of fluorite contain cerium, the author thinks a ceric fluoride is the source of the free fluorine, by dissociating into cerous fluoride and fluorine, analagous to the decomposition of manganese tetrachloride at ordinary temperatures.

ABSOLUTELY INSTANTANEOUS PHOTOGRAPH.—Probably nothing, since the production of the famous photographs of Watron of horses in motion, has attracted more attention in that line than an exhibition now being made in New York of a photograph taken by an army officer with Anthony's instantaneous collodion. An old army mule, condemned to death, was killed by a small charge of dynamite placed on his neck and exploded by electricity. The picture represents the mule standing with his head entirely blown off, and the rope with which he was tied to a short stake in the ground in the same position that it was in when tied to his head, as it had not time to fall to the ground. The slide of the camera was dropped by the same charge of electricity that exploded the dynamite.

BURSTING POWER OF ICE.—Ed. Hagenbach experimented, during the past severe winter, upon the bursting force exerted in the expansion of water when freezing. Two interesting experiments were made with cast-iron hand grenades. The outer diameter was 15 centimetres (5.9 inches), the inner diameter 15 centimetres (5.04 inches). The shells were filled with water, closed with a screwed iron plug, and exposed to the cold. Both shells were broken and a curved thread of ice was projected, by means of an ice column, from the upper surface. One of the plugs was evidently thrown out with great violence, and to such a distance that it could not be found. The curvature in that case was bent upward.—*Wiedmann's Annalen.*

SCIENTIFIC TRUST FUND.—When Professor Tyndall was about to leave this country he left a fund for "the assistance of needy American students in physics who should show aptitude for original study and should wish to complete their education in Germany." It is stated that the fund has now accumulated sufficiently to furnish a moderate income to two students.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Stormont (Utah), August 19th, $3,300; Northern Belle, 24th, $7,661; Bullion of Paradise, 23d, $1,425; Idaho, 23d, $13,450; Ontario, 22d, $10,975; Barbee & Walker, 23d, $2,069; Frisco, 23d, $15,000; Mammoth, 23d, $5,177; Germania, 23d, $4,840; Hanauer, 23d, $2,140; Wood River, 23d, $2,570; Stormont, 23d, $3,305; Ontario, 24th, $10,905; Barbee & Walker, 24th, $1,981; Germania, 24th, $2,050; Mayflower, 24th, $4,300; Ontario, 25th, $7,660; Frisco, 25th, $1,700; Hananer, 25th, $2,155; Germania, 25th, $1,540; Stormont, 25th, $2,216; Barbee & Walker, 26th, $1,647; Hanauer, 26th, $2,140; Germania, 26th, $1,350; Great Basin, 26th, $5,500: Frisco, 27th, $17,500; Bullionville, 27th, $2,358; Western, 27th, $17,267.

SHOULD hydraulic mining be stopped, many hundreds of people who are not directly connected with it, would find their business ceasing to be profitable, and would be compelled to seek their livelihood in other lands.

MINING SHAREHOLDERS' DIRECTORY.

The Mining Share Market.

The market for mining shares is not particularly active just now, nor has it been for some little time. Up on the Comstock the situation is unchanged. The *Enterprise* says: Although no points have been reached in regard to which much can be said, yet work is making good progress in the lower levels of all the leading mines. This work must soon be productive of results that will claim special attention and cause a demand for stocks at points where new ground is being opened and explored. The indications at the north end are that the water will soon be drained off sufficiently to allow of the resumption of drifting on the 2700 level of the Union Consolidated. The pressure is now so small that the water is allowed to flow ont at its own gait from the drill holes in the east drift from the Union shaft, the pumps easily handling all that comes to them. In the middle mines they will soon be able to resume prospecting operations on the 2400 level without fear of water. The main south drift through the Chollar and Potosi ground will be cleaned out and repaired next week, when the next work in order will be crosscutting. At the Savage they will also be able to act on the aggressive next week. The hydraulic pump continues to work well, even when run up to 13 strokes per minute, and no reason can now be seen why it should not continue to so run, barring accidents liable to occur to any kind of machinery when in motion.

Although rumors current on the street, the Virginia *Chronicle* said: It was reported that the drills on the 2700 level of the Sierra Nevada had run into ore. Mr. Patton told a *Chronicle* reporter to-day that no developments had been made in the mine, and that he would be only too happy to show up ore if the same could be found. He added that he had still faith in the north end, and that if there were ore in any of the mines under his direction, he proposed to find it and let the people see it without delay. He positively assured the reporter that there would be no hiding developments, and that there had been none.

A New Safety Clutch.

The Palmer safety clutch for elevators—the latest device for preventing accidents on elevators—has attracted a great deal of attention at the fair, where the inventor has an elevator in operation with the new clutch attached. The clutch is placed under the platform of the elevator on timbers especially arranged for it. In fact, the clutches proper are attached to a skeleton platform under the main one, but independent of it. This is balanced by a weight, the rope of which goes over the same pulley as that which raises and lowers the elevator. Therefore, the platform carrying the clutch will rise and fall with the elevator, and yet be independent of it. If now the rope carrying the elevator should break and the elevator drop, it will only drop an inch or two, and will then strike the dogs of the clutch, these holding the lower platform and preventing further descent. This action is instantaneous and positive, no spring weights or anything being required. The cage is caught before any momentum is given it. The platform underneath supports all the weight, instead of suspending it. The greater the weight on the elevator, the quicker the catch and lighter the fall. The dogs jam towards each other, one pair on each side, and do not, therefore, tend to spread the guides, as most clutches do. The cage is caught instantly. We shall shortly illustrate this new device, which is the simplest form of clutch made.

THE Helena (Montana) *Independent* reports the sale of the famous Broadway mine, with its associate, the Mntual Agreement, to English capitalists, together with the mill connected with the mine, for $225,000. One hundred and twenty-five thousand is deposited with the Kountze Bros., of New York, and another $100,000 is to be paid within six months.

CERRO GORDO, the old stand-by mining camp of Utah, is on the turn for happier days. There are three companies at work there now.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

BUDDLES.—Amador *Ledger*, Aug. 27: Buddles have been put in the Zeilo mill, for the purpose of saving the sulphurets which escape the Fruo concentrators. P. Cramer, an experienced man with buddles, is in charge of them at present.

VOLCANO ITEMS.—There is scarcely anything going on in mining matters around Volcano, owing to the scarcity of water. The water supply has been unusually scant this season. It requires all the water in the Volcano ditch for the cleaning-up operations at the Grass Valley gravel claim. At the Grass Valley hydraulic claim a strong force of men are employed cleaning up. A satisfactory yield is expected. The Downs mine is idle, as far as the extraction of rock is concerned. The mill has closed down for want of water. The ore dump has plenty of rock on hand. The shaft is being thoroughly repaired and retimbered. Nothing is doing at the Volcano tunnel. A contractor was on the ground lately, sent up by the company to estimate the cost of so controlling the water of the south branch of Sutter creek as to prevent it flowing through the tunnel. It is feared that if both streams are permitted to flow through the tunnel, it will be seriously damaged, if not ruined, in flood time. Hence the idea of diverting the south branch.

BUTTE.

GOOD PAN.—*Mercury*, Aug. 26: A pan of dirt taken from a mine at Centerville, in this county, the other day, yielded $21.

BIG BEND.—Mr. Waldemar Allstrom, of the Monte Cristo mine, arrived in this city Sunday evening. He is managing the Big Bend property, and stated that work would be commenced on the roads leading to Big Bend this fall. He also stated most positively that the tunnel would be in full operation at the beginning of next year.

RIVER BED.—It has been a well-known fact for years that the river bed from the head of the Cape claim down below Hamilton Bend is very rich. This is also known to the Chinamen, who, when summer sets in and the river runs low, go out on the points of the bars running into the river and mine there with rockers, getting all the way from 10 to 15 cents to the pan. There is one point about a quarter of a mile from the lava beds that has prospected unexceptionally rich. The river runs over a bar composed of gravel and heavy rocks, and in summer it afforded a good crossing for stock. A number of years ago a small wing-dam was built in the river, and although the men were only able to work a few days, they took out $1,500 to the man. Since then several attempts have been made to wing-dam it, but have been unsuccessful. About two years ago, Henry Bird and T. W. Reece concluded that they would make an attempt to work the ground, but did not complete all their arrangements until this summer. On the 1st instant, they commenced the work. There was considerable water running in the river, and the current ran close to the south shore, so that it made it very difficult work. They made large boxes of heavy lumber and commenced sinking them from the shore filling them with sand. Both Mr. Bird and Mr. Reece worked a large portion of the time in water up to their waists, but they finally completed the dam, which forms a curve running out from the bank to a point beyond the middle of the river and joins on to a long bar coming out from this side. The entire length of the dam is 600 ft. The water is now being pumped out of the claim, the motive power being a wheel 16 ft long and 10 ft in diameter. On the end of the wheel is a six-foot drum which carries a belt to a three-foot drum, and this carries a belt to the drum that the pump travels. A large flume 160 ft long is being put in position, and as soon as the water in the dam is pumped out, a gang of Chinamen will shovel the gravel into the boxes. The ground prospects very rich, and Chinamen seeing the head of the bar which projects into the dam, gradually appearing, would go into the claim moonlight nights and rock until morning. But this was finally stopped. There is no doubt but that the gentlemen will make a very handsome thing out of it, for the ground has never been worked to any extent.

RICH DIRT.—*Butte Record*, Aug. 27: Some of the Centerville mines are still yielding well. One pan of dirt produced $21 the other day. It was taken from a ravine that has yielded as high as $53 to the pan. The Butte creek country will prove a bonanza yet.

CALAVERAS.

CLEAN-UP.—*Calaveras Chronicle*, Aug. 21: A partial clean-up has been made in the McCann & Rigney gravel mine on Tunnel Ridge. The gravel paid well, in fact better than the proprietors expected. Work is progressing actively in the mine, and pay gravel is being taken out. Owing to the scarcity of water in the ditch it will be quite a while before a thorough clean-up can be made, but when that time arrives the yield will astonish some of the croakers who are continually harping about "old played out Calaveras."

WORK TO BE RESUMED.—Active operations are soon to be commenced on the well-known Hoosier and Horsethief quartz mines, situated in the Jesus Maria district. The mines have been idle for quite awhile owing to the litigation. The mines have been well developed by the present proprietors. A shaft has been sunk on the lead to the depth of 140 ft, and levels run north and south over 60 ft, uncovering a splendid body of quartz. A tunnel has also been run on the lead for a distance of 250 ft, the rock averaging $12 per ton the entire distance, the lead showing over four ft in width. The proprietors—Messrs. Boyle, Harper and Farr—took out over $16,000 from the mine while running the tunnel and sinking the shaft for the purpose of developing it, working unassorted rock with an arastra. There are now some 8,000 tons of rock in sight, some of it being high-grade ore, but all of which would yield remarkably well if put under the stamps. The natural facilities for a mill are good, the proprietors having a free water right, taking the water from Jesus Maria creek in two large ditches.

EL DORADO.

THE ARCTIC QUARTZ MILL.—*Mountain Democrat*, Aug. 27: John M. McLaughlin came down from Grizzly Flat last Thursday, and reports that Dan Wickham had just completed the new 10-stamp mill at the Arctic mine, and when McLaughlin left they were just about to slip on the belt and set the machinery in motion.

GOPHER-BOWLDER.—Lively work is being done at the Gopher and Bowlder mines. The new 20-stamp mill is being kept in constant operation on ore from the main Bowlder tunnel, and is crushing from 20 to 25 tons per day. The ore is of the same character as the experimental 500 and odd tons from the same locality that was some time ago crushed at the Chaparral mill, and the appearance of the plates indicates that the returns in this will be fully as favorable as in the former case, which will be highly satisfactory, as the transportation of the ore cost $1.50 a ton in that case, which will be saved now and added to the profits. A clean-up will be made about the 15th or 18th of Sept.

TWENTY-STAMP MILL CONTRACTED FOR.—Messrs. Solkedt & Eckhardt have closed a contract for the immediate erection of a 20-stamp quartz mill at the Mount Pleasant mine, Grizzly Flat. They commenced work last Monday, and are increasing their working force as opportunity offers. They expect to have the mill running within six weeks.

THE CHAPPARAL MINE.—Work has been resumed at the Chapparal mine on the ore body that was opened up from the shaft last spring, and from which they were driven out by the water at that time, but which is now drained and in good workable condition. It is calculated that within two or three weeks enough ore will have been taken out to justify starting up the mill again. In the

meantime the tunnel is being driven from Kelsey canyon toward the shaft. This tunnel is 300 to 400 ft lower than the present workings at the bottom of the shaft, and henceforward no interruptions on account of water are apprehended.

SALE OF A MINE.—A Mr. Lyon has purchased of Messrs. Orcutt, Pierce and Buckingham their recent quartz discovery near Pleasant valley. The purchase price is said to have been $22,500; $5,000 down, and the balance in deferred payments. It is reported that he will immediately commence active operations on his new purchase. May success reward his enterprise.

EUREKA.—Georgetown *Gazette*, Aug. 26: The body of ore just opened up on the lower level of the Eureka, prospects well in free gold across the entire ledge, a distance of 40 ft. A large force is now engaged in drifting north on this immense face of ore. The Eureka is most assuredly a success.

A fine specimen nugget and some smaller pieces, amounting to $565, was found by George Sharon on Tuesday, the 15 instant, in his mine on the Greenwood seam belt, west side American canyon.

MINING ENTERPRISE.—*Mountain Democrat*, Aug. 27: Mr. O. H. Spencer was in town this week, awaiting the arrival of a 60-horse-power holler and engine, which he has recently purchased and is having transported to the Morey Co's. claim—the old Grouse gulch mine—near Grizzly Flat. This mine was opened many years ago, and worked with flattering prospects by a company in which E. R. Morey, of Grizzly Flat, and Hon. Geo. O. Blanchard, of this city, were members, by whom it was transferred to a company in which Mr. Spencer is the principal stockholder. The heavy machinery above referred to is being forwarded for the purpose of erecting substantial hoisting works, with the intention of sinking the shaft, which is now down 100 ft. 500 to 1,000 ft deeper. The ledge, which was about 20 to 24 inches wide at the surface, has gradually widened until now, at the bottom of the shaft, it is over 5 ft. Mr. Spencer has determined to open and work this mine on strict business principles, for what there is in it, and not for speculative purposes, and will superintend its working in person. This fall he expects to put up a 10-stamp mill, for which the engine and boiler now on the way will furnish abundant power, as well as for the pump and hoisting works.

MARIPOSA.

BREEN QUARTZ MINE.—*Gazette*, Aug. 27: This mine, which lies contiguous to the Diltz, like many others in the same vicinity, has acquired no great amount of notoriety, although labor has been done sufficient to satisfy anyone that this vein of auriferous ore possesses inducements for development. We have now before us some specimens of the ore taken direct from this vein by Colonel Swadley and others, who visited the mine on Monday last. It required no magnifying glass to observe the jettings of free gold cropping out in pyramidical forms from the solid quartz. The extent of the richness of this body of ore is of course unknown, but sufficient has been exposed to give assurance of its permanency. Negotiations have been made with the owners for the mine by Colonel Swadley, and will form an important adjunct to the Diltz mining property, which has also been bonded to Colonel Swadley, who represents an Eastern syndicate formed for mining purposes.

NEVADA.

NEW PUMPS.—*Transcript*, Aug. 25: The eight-inch pump in the Nevada City mine, which has recently been found incapable of handling the water, is to be replaced next week by a ten-inch plunger.

PEABODY.—The company sinking on the Peabody mine at Grass Valley for an interest therein had nearly finished their contract when the water began to come in so fast, that the pump could not handle it. Sinking has been temporarily suspended in order that a larger and more powerful wheel can be substituted for the one heretofore in use.

MOUNTAINEER.—The Mountaineer mining company, operating on Deer creek above the Merrifield, finding that the supply of water from the Excelsior ditch is not regular enough during the dry season, are connecting with Snow Mountain ditch on the other side of the creek. The new arrangement requires that 1,200 ft of pipe be laid. In the meantime the mill, which depends upon water for motive power, is idle.

LUDDINGTON.—W. T., S. M., Thomas and John Shurtleff, all of this city, who, with Geo. Flint, have for 1½ years been developing the Luddington ground, which is the second claim below the Godfrey drift mine at Alta Hill, are of late meeting with very favorable indications. Altogether they have run about 2,000 ft of tunnel, being misled until recently by a bar in the channel. For a week past they have been passing along the northeast rim of what is evidently the main lead, and the gravel encountered shows considerable gold. Their bond on the ground has 1½ years to run, and before that time has elapsed they hope to have opened up a first-class drift mine. The Godfrey, which was for a long time under very discouraging conditions, is said to now be paying largely.

ROBERT CRYER has been appointed superintendent of the Peabody mine at Grass Valley.

MINE SOLD.—*Foothill Tidings*, Aug. 27: The Buckeye mine, situated between Sweetland and Birchville, has been sold to Sweetland men. This mine was originally purchased by an English company from Oen. O. Evans, John S. Stidger, Thomas Clarke, Dan. Rourke, P. Purcell and John Taylor. These gentlemen sold out to an English company in 1870 for something over $200,000. After working this claim for some years and realizing an enormous profit therefrom, Geo. D. McLean, then the superintendent of the mine, and Mr. Geo. E. Yates, purchased it from the English company. The mine was successfully worked for a number of years by McLean and Yates, and was recently sold by them to Messrs. Rourke (one of the original owners), James O'Farrell, Martin Burt, and others, for the small sum of $6,000. Mr. Rourke is now back in the old business of extracting the lucre from the shining sands. We understand the mine will be worked by drift process.

A CORRESPONDENT writing from North Bloomfield gives us some items of interest from that region: Things are kind of dull here lately, but are picking up considerably just now. The Derbec mine is improving at the present, and the management is putting on an additional force of men. The gravel in the mine is looking well. The new shaft, having had many set-backs, has progressed slowly, but is now doing better. Sushay's quartz mill is grinding away on ore night and day.

PLUMAS.

ELIZABETHTOWN.—Plumas *National*, Aug. 23: Corbin & Manson have commenced moving the machinery from the Meylert & Hughes shaft to their new shaft at the lower end of the Loring & Leavitt claim. This shaft is down 40 ft, and will have to go 40 ft more to get bottom. They intend to put on heavy machinery at the lower end of the O'Neill ranch, and work the whole flat from a shaft at that point. Mr. Manson tells us that a man has been employed for some time in going over the bedrock which paid so richly in the Loring & Leavitt, and his average pay has been $35 per day. They will push the work rapidly in these claims, and employ all the men they can make profitable.

MORE "BIG SLUGS."—The Western gravel claims, at Newtown Flat, owned by Bell Bros. & Co., are attracting considerable notice just at present, for the reason that they are turning out some huge pay in the shape of heavy lead gold, with indications that the strike is a permanent one. For the past 8 weeks, with one man taking out pay dirt, the result has been $1,050. We were shown the gold, and it has the regular old-fashioned appearance, indicating that the owners are on the right track. Among the nuggets were pieces weighing $65, $55, $51, $45, $26, and numerous smaller pieces running from $1 to $10. The clean-up for Tuesday was $120. Water is very scarce at the present time, and it is difficult to get enough to wash up what little pay grit is being taken out, but the owners intend to have the mine thoroughly open by the time that water comes, and with a full force of miners will make business lively. The Western claim was worked some 20 years ago, and the ground easily reached was panned out, since which time it has been idle. Lewis Bell has always kept possession of the claims, however, with the idea that they would prove valuable, and the present work is certainly proving that his judgment was sound.

INDIAN VALLEY MINE.—Greenville *Bulletin*, Aug. 20: New hoisting and pumping machinery is to be put up at the Blood shaft. The framing is now ready and will be raised to-day. This shaft is 700 ft deep, going 300 ft deeper than the tunnel leading to the mill. As soon as the pumps are ready the bottom part of the shaft will be pumped out and work resumed upon the lower level; this will not be much of a job, as the amount of water in the mine is but little. From the top of the shaft a way is graded to the upper tunnels; from these the ore will be run out and dumped down the shaft 400 ft, to the inner end of the tunnel. The space left by the old stopes gives room for chutes at which the cars will be loaded for the mill. The upper tunnels are being cleaned out and timbered so that ore can be taken from them as wanted. In the old condition of the mine no system could be discerned; now there is a comprehensive plan, connecting all these tunnels and the shaft in one design. The arrangement is so good that all ore containing over $2 per ton in gold can be worked at a profit.

GRANITE BASIN.—From a correspondent we learn the following: The 20-stamp mill for the Morning Star and Trenton mines has been coming for the past week, and with teams hauling lumber for the building, give activity and bustle in camp. The mill is to be placed in the canyon below the mines. The grading of the road leading to it, which has been in progress for the past 2 months or more, is now finished. The work was found very heavy by the presence of hard rock not expected. The same trouble is met in grading for the mill, and it may take another 2 weeks getting ready to erect the machinery.

TRINITY.

GOOD PROSPECTS.—*Journal*, Aug. 27: Capt. O. H. Atkins informs us that he recently visited the East Fork and found that Harrington & Montgomery were about opening a new mine in a high bar on that stream, which prospects quite well. Capt. Atkins showed us some gold which he panned out, and which is regarded as a fair drift prospect. With a good hydraulic rig on the ground, it is thought the claim will pay splendidly.

FIFTEEN UP.—Miners here and elsewhere in this county are busily engaged in getting their claims ready for next winter's work. Of course it will be a wet season.

YUBA.

QUARTZ MINING AT TIMBUCTOO.—*Foothill Tidings*, Aug. 27: Last Monday the builders completed a new quartz mill at Timbuctoo, in Yuba county. The mill will be used for the reduction of ore from the Marc Antony mine. The mill and mine are owned by Mr. M. T. Brewer, of Sacramento, and Mr. R. G. Hart, of Grass Valley. The ledge of the Marc Antony averages about 4 ft in thickness, and shows well. It is heavily charged with gold bearing sulphurets. The rock runs from $8 to $10 per ton by mill process, which yield fully justifies the owners in erecting the mill. At the mine there is a shaft down 105 ft, and a tunnel is in 100 ft to the ledge; then following on the ledge about 200 ft. This makes the inner end of the tunnel about 130 ft from the surface of the ground. The ledge has constantly improved from the surface to the depth to which it has been worked. On the dump there are about 300 tons of ore, and the mill is now crushing that as rapidly as possible. The mill is a 10-stamper and is run by a 40-ft overshot wheel, with a 5-ft breast. Fourteen men are at present employed about the mill and mine. Mr. Hart will superintend the working of the mine and mill. He says that the prospects are very flattering, so much so that he and Mr. Brewer purchased the entire property. Water for all purposes at the mill is obtained from the Excelsior Water Co.

NEVADA.

WASHOE DISTRICT.

CON. VIRGINIA.—*Enterprise*, Aug. 28: The joint Best & Belcher crosscut on the 2500 level has been extended 25 ft. The joint California winze, on the same level, has been sunk and timbered 8 ft, and have commenced setting the hoisting engine.

OPHIR.—The joint Mexican east drift from the 2900 station of the joint winze has been extended 20 ft.

MEXICAN.—At the joint Union Con. east winze the tank station at the 2600 level has been completed—the tank placed in position and the winze sunk and timbered 8 ft.

CALIFORNIA.—During the week 69 tons and 600 lbs of ore have been extracted from the 2000 level.

SIERRA NEVADA.—The tank pit at the 2700 station in the joint Union Con. east winze has been completed and the tank placed in position.

UNION CON.—The tank pit at the 2700 station of the joint Sierra Nevada east winze has been completed, and the tank placed in position. The tank pit at the 2600 station of the joint Mexican winze has been completed—the tank placed in position and the winze sunk and timbered 8 ft.

KENTUCK.—On 240 level have breasted out 2 square sets, put in 5 sets on track floor, and 4 sets on second floor. Are compelled to work some poor ground. During the week have assorted and sent to the mill 10 tons of low-grade ore per day. Usual work on top.

YELLOW JACKET.—The north lateral drift on the 3000 level has been run 30 ft during the past week, making the present length of the same 100 ft from the switch. The ground continues very hard and dry.

NEW WELLS-FARGO.—Are now starting a south lateral drift east of the vein on the 500 level. When this drift has reached a sufficient distance south, a crosscut will be run to the west across the vein. The face of the main west drift is still in good looking vein matter, and giving low assays.

ALTA.—Are cutting out for pump station at 2150 level. About 4 or 5 days more will finish it, when the pumps will be placed there.

CRABB DISTRICT.

FLATTERING.—Esmeralda *Herald*, Aug. 26: A meeting of the miners of Crabb Mining district was held August 13th at S. Y. Crabb's camp. Local laws governing the district were adopted, and except that locators are allowed 300 ft on each side of the lode line, the laws do not differ in the main from those of Esmeralda district. A. Davidson was elected Recorder for the term of one year. The reports from the district are very flattering, and the prospects for a live camp there in the near future are good. A quantity of rock was brought to Aurora and "horned," showing exceedingly rich in coarse gold, going high up in the hundreds of dollars per ton. The rock is quite soft, and would pay big even in an arastra. The ledges that have been opened to any extent show well defined foot and hanging walls, and vary from 2 to 10 ft in width. Work is being done on several of the claims. There have been 20 locations made already, and the number will no doubt be doubled in a short time, as the district is receiving considerable attention. The mines are not more than 2 miles in a direct line from the East Walker river, which affords the finest chance in the world for running an unlimited number of stamps with water power. We are assured that ore could be mined and milled at an expense not exceeding $5 per ton.

ESMERALDA DISTRICT.

PROGRESS.—Esmeralda *Herald*, Aug. 26: The prospects of Esmeralda mining district are certainly brightening up a little, and there is a better feeling existing at present toward our mines than for many months previous. A number of transfers of valuable mining properties have been made of late. There is, beyond a doubt, the finest opening for capital, right here, of any mining region on the Pacific coast. There are millions of tons of ore in sight, and even lying on the dumps made here in early days, that will pay a reasonable profit for milling, while there is now uncovered in the Cortez, Centennial Humboldt West, Silver Lining, New Esmeralda and other mines, ore that would pay handsome dividends if we had milling facilities.

THE CORTEZ.—We are pleased to see that, on the 22d inst., the Cortez mining company purchased, for $1,000, the Bonanza tunnel, formerly owned by Silas B. Smith. The purchase includes both the Smith and Goodrich title. This tunnel extends from Willow gulch into Silver hill 602 ft. The work in this tunnel will be pushed forward at an early day, until it reaches the Cortez ledge, which it is thought it will do in running about 150 ft. When this shall have been done it will afford a splendid and economical means of ingress and egress to and from the lowest point now attained in the mine, giving excellent drainage, thorough ventilation and means of supply, and greatly reduce the expense of hauling lumber, etc., to the mine. The ore body struck on the southwest drift, on the level with the tunnel now in use, is looking well, and is enlarging. Exceedingly high assays could be obtained from this body, which was reached only one week since.

THE HUMBOLDT WEST.—Work has been confined to the south drift, which has been driven several ft during the week. The same good quality of ore has been encountered in the drift that was found in crosscutting the ledge on the same level—thus 100. This immense ore body can be easily mined, and at a trifling cost put into a mill at the base of Humboldt hill, on which the mine is located.

THE CENTENNIAL.—Work in this mine is progressing very satisfactorily. The rock in the bottom of the incline is looking better than at any other point, and a superior grade of ore is being extracted.

SAFFORD DISTRICT.

VERY POOR ORE.—Eureka *Sentinel*, Aug. 26: We had high hopes of the new district near Pallsade. We wished the new mines to prove a grand success. They are splendidly located near the Humboldt river and the railroad, and the great mass of high-grade ore reported in sight caused us to hope and believe that a second magnificent mining locality had been discovered within the limits of Eureka county. We now fear that all of these bright anticipations are to be doomed to disappointment. We have known for 3 days that assays made here were not satisfactory, but we thought best to await developments and further proofs. We hesitated to condemn without first being doubly assured of the correctness of our position. There seems now little room for doubt. The outlook of the new discovery is not as bright as it was. The assays have not held up. A dozen or more samples brought hither within the last few days have failed to show any value worth recording. Indeed, many pieces have not shown as much as a trace of either of the precious metals. The evidence is overwhelming that the great mass of the rock is comparatively valueless. Under this state of affairs it becomes the duty of the *Sentinel* to make public the facts. There is evidently a very rich streak in the Onondaga mine, but the great mass of the ledge matter does not pan out. Possibly this rich streak may lead to something good, but that remains to be demonstrated. Capt. Foster and others have brought up average samples, which, on being assayed, were found to contain next to nothing. There is a chance for the heavy mass of black iron to give way to the yellow carbonate ore at depth, and this we hope may be the result, but until it does, the principal mine cannot yield in paying quantities. The finding of any high-grade ore at all is of course an encouraging feature, and one worth following up.

WALKER DISTRICT.

PROSPECTING LIVELY.—Eureka *Sentinel*, Aug. 23: A gentleman who arrived on the Comstock last week from the Walker river country says prospecting is very lively out that way. Copper ores are being looked after quite as assiduously as are those of the more precious metals, as it has now been demonstrated that they can be made to pay well, even when shipped to Dayton. Much good copper ore is found on and near the surface. Some very promising mines, containing gold and silver, are being opened, and the owners of some of these are already shipping ore to the reduction works at Dayton.

ARIZONA.

BORVIA COPPER MINING CO.—Globe *Chronicle*, Aug. 25: Noticing in the New York papers the organization of another copper mining company bearing the above title, a representative of the *Chronicle* visited the property a day or two since and found that it consisted of 4 copper locations—Borvia, Cuban, Sunrise and Sunset. Each of these are full claims of 1,500 by 600 ft, situated on Cactus hill, some 3 miles from Globe and within half a mile of the Old Dominion mines.

MACK MORRIS.—The ore shutes are full to overflowing, and Mr. West, the foreman, has been compelled to stack ore in the head of drifts on the 3d level in order to give room for working. It is estimated that fully 250 tons of ore is in this manner piled away in the mine ready to bring to the surface.

EMBLINE.—This property keeps up its excellent showing of high-grade ore, which is down 91 ft. The dump contains about 200 tons. It has been found necessary to procure air pipes for the winze before any further sinking is done.

MINERAL HILL DISTRICT.—*Enterprise*, Aug. 26: The Never-Give-Up, Hard Cash, Rough and Ready, and the Baby are located about 4½ miles due north of the Gila river and ¾ of a mile from the wagon road now building from the Silver Belle quartz mine to the river. The owners propose to commence work on them as soon as the rainy season passes, and will show them up in good style before they cease operations.

COLORADO.

SALE OF THE HIDDEN TREASURE.—Breckinridge *Journal*, Aug. 26: The great excitement in Summit county mining circles during the last week was the sale of the Hidden Treasure mining property—the extension of the St. Johns property near Montezuma—for $40,000.

NEW MACHINERY OF THE R. E. LEE.—Leadville *Herald*, Aug. 26: The new plant of machinery being put up by the Robt. E. Lee company is of importance to the mining interest of Leadville, however far more than the results directly to be derived from the mine itself. The drainage furnished by this pump and machinery will enable scores of properties beyond to resume operations, which have for months past been unable to continue work. The Little Silver, American, Tip-Top, Bang Kok, Enterprise mining company and dozens of others will be directly benefited.

BONANZA.—Cor. Denver *Tribune*, Aug. 27: Our mining district, though but a little over one year old, has located within its boundaries over 5,000 claims. The strikes of the past season pale away into nothingness in comparison with those of the present. Each day's development goes to show that our camp will at no very distant day rank with Colorado's chief and world-famed ore producers. Many men are making fortunes here by developing their prospects, and provlug them to be mines of no inferior quality. Capital is drifting in from all quarters. Each day we hear of new sales being consummated.

DAKOTA.

OOON CLEAN-UP.—Black Hills *Times*, Aug. 27: The Gustin mill, in Blacktail, cleaned up on Saturday—a semi-monthly clean up. The retort is a good one, weighing 640 ounces, and valued at something over $11,000. The Gustin mine and mills are owned by Nimrod Lancaster & Co., and have operated since the fall of 1877. The mine is a deposit or blanket formation, and is without exception the best one ever discovered in the Hills. There has been no petering of the ore body, but on the contrary it has increased in quantity and quality since the first pick was stuck into it until to day. There is now enough ore in sight to warrant the erection of a 60-stamp mill in addition to the 45 now running.

CARBONATE NOTES.—The new camp is progressing favorably, a large amount of work being done, and more doing, although there is not that rustling spirit manifested by all the first locators we should like to see. Quite a number of them are at work all the time, noticeably among whom are the Jefferson, Adelphia, Richmond, Frank Norton and Frank Bryant companies, Watson, Dolloff and crowd, Craig, Ellis and outfit, Pat O'Brien and a few others, and to offset these there are a great many who develop their claims just as a local editor fights, very cautiously.

IDAHO.

WOOD RIVER ORE.—Wood River *Times*, Aug. 24: During the months of June and July over 2,000,000 lbs of ore, averaging $200 per ton, were shipped from the Wood River mines. This is exclusive of the bullion, of which there were only 4 carloads shipped, the only smelter on the river not having got fairly started. The smelter now produces a carload of 10 tons of good grade bullion every 48 hours.

THE FIRST STEAM WHISTLE IN BULLION.—The Bullion hoisting works were started up last Sunday, and the whistle "tooted" for the first time.

ORE AND BULLION SHIPMENTS.—From Bullion, during the 2 weeks ending to-day, 863 sacks of Bullion ore and 818 sacks of Mayflower ore were shipped. From Hailey, during the week ending this morning, Cliff & McKay shipped to Kelton 500 sacks of Wood River and 335 sacks of Mayflower ore. C. B. Fox shipped last week 65 sacks of Idaho ore. About 25 tons more were shipped direct from the mine. The sacks average 130 lbs. From the smelter, during the week ending yesterday, the Wood River smelting company shipped 160 tons of base bullion and high-grade ore. The ore was shipped because more was offered for sale than the smelter could work. The utmost capacity of the furnace is 20 tons per day.

THE SMELTER AT KETCHUM.—The foundations for the sampling, smelting and separating works at Ketchum are up, the turbine wheel is set, and the work is being pushed actively. They are expected to be ready to start up by the 1st of October at latest.

WOOD RIVER NOTES.—*Times*, Aug. 24: Times have been very dull on Wood River during the past 30 days, and the dullness has been felt to a greater extent because of the exceeding liveliness of all branches of business during the preceding 90 days, when the rush of new-comers was at its height. Several causes will contribute to the gradual improvement. The mines are opening up splendidly, and men of means are coming in on every stage to look for bargains. Again, the various reduction works will soon begin to buy and work ores. At Sawtooth a 20-stamp mill is being erected, and 10 stamps, with a daily capacity of at least 20 tons per day, will be ready to start by the 1st of October. The other 10 will follow soon after.

MONTANA.

BULLION SHIPMENTS.—Butte *Miner*, Aug. 23: The shipments of silver bullion bars by the Pacific Express Co. through their office in Butte for the week ending Saturday, August 21st, footed up 4,717 lbs, valued at $6,372. This weekly shipment, if kept up, would aggregate $4,118,254 for the year.

MOULTON.—The Moulton mine still maintains its steady development. The main 3-compartment shaft had reached a depth yesterday of 464 ft. Exceedingly rich ore is coming out of the Moulton. In drifts No 7 and 8 one of the finest bodies of ore that has been uncovered in this district has been found. These samples gave the following results: $990 07, $1,014 04 and $1,304 52 to the ton of ore. This rich developing looks as though the Moulton will rank as the bonanza of the camp. Crosscutting at the 400 level is pushed, both north and south, with great vigor. The north cut is run to tap the north vein, which at 300 ft deep is proven to be rich, and the south cut is running for the vein, which at the 300 level is producing $1,000 ore.

BELLE OF BUTTE.—The Belle of Butte mine is looking first-rate. The drifts now being driven on the ore vein, both to the east and west, are developing a large vein of first-class ore. From these levels and the stopes in the levels nearly 30 tons of ore are extracted daily. The character of the ore is for the most part free milling.

LEXINGTON.—The new company has taken possession of the mine, and the operations will be conducted hereafter under the new management. It will take some little time to complete station-cutting work at the 200 level after which the main shaft will be sunk deeper. A new Knowles' double-plunge pump has arrived. At the old incline shaft a winze is going down, and it has reached a depth of about 70 ft below the old level. The ore raised from the winze is partially free-milling, but is growing of a baser character as the winze attains depth. The company will, for the present, run the Lexington 10-stamp mill on tailings, and will clean up the ore on dump piles for milling. The construction of the Lexington 40-stamp mill will be commenced immediately. The old 10-stamp mill is, we understand, to be remodeled to some extent and turned into a tailings mill.

ALICE.—Of the Alice mine there is nothing unusual to report. The mine is showing up well in all its workings. In all the openings of the mine the appearances of the ore-bodies are flattering. Daily ore is taken from all the levels, from the 100 down to the 700 level. The quantity extracted per diem remains at the old standard, which may be reported as averaging 75 tons per diem. Both mills are running regularly and smoothly. The Bruckner furnace has arrived, and will be set up immediately.

MAGNA CHARTA.—The sinking of the main shaft at the Magna Charta mine to a greater depth than 300 ft has not commenced yet. Yesterday a good quality of ore was being raised from the levels and stopes of the mine. From the long tunnel there is considerable high-grade ore coming out daily.

NEW MEXICO.

IVANHOE.—*New Mexican Mining News*, Aug. 22: The owners or managers of the Ivanhoe mine in the Black Range are very particular about letting people go into the mine, and very few persons can gain admittance. This is because there is an inconvenient habit on the part of the people of slipping pieces of ore into their pockets, and the amount that would be carried off in that way during a month would be worth some thousands of dollars. Ore with free gold projecting from all sides is worth something a pound, and it is not very pleasant to have much of it lugged off in the pockets of one's visitors. A number of persons have been turned away from the mine and made very angry thereby. The managers are inexorable, however, and enforce the rule.

THE BLACK RANGE miners are confining their labors to a close proximity to the camps of the range. Since the Indians have appeared in such force in that part of the Territory they do not venture out in the mountains very far unless in considerable numbers and well armed. Even under these conditions it is not worth while to go out, as the men cannot work and be perpetually on the look out for Apaches, and ready for an attack. Consequently they keep near home and are waiting for the excitement to blow over. They believe the Indians will soon leave the country as the troops and citizens are making it uncomfortable for them down there now, and they will be likely to seek a safe and more retired section.

OREGON.

CLEANING UP.—*Democratic Times*, Aug. 26: The Sterling company has several men engaged in cleaning up, whose labors will end before many days. The results of the season's run, although not apparent, are known to be very good. Wimer & Simmons, of Josephine county, have finished cleaning up. We learn that they took out 100 ounces of gold the last day, and that their mine yielded about $30,000 during the past season. Jas. and A. C. Manning on upper Grave creek are preparing to work with M. W. Hale the coming winter. Zach. Cameron informs us that most of the miners on Applegate are getting ready for winter. We learn that negotiations are pending for the transfer of Yaudes, Saltmarsh & Co's. extensive mines on Sterling creek, to Ankeny & Co.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

WHITE CHIEF G. M. CO.—Aug. 31. Location, Arizona. Capital stock, $10,000,000. Directors—S. Belden, J. A. Crabtree, J. Fleming, T. Fowler and G. Shultz.

BLUE MOUNTAIN G. M. CO.—Aug. 31. Location, Arizona. Capital stock, $10,000,000. Directors—Wm. Shea, F. Stolle, J. Moore, D. Murray, J. F. Mahoney.

HOMESTAKE M. CO., NEV.—Capital stock, $10,000,000. Directors—Frederick Nauart, Maurice Newburg, Hermau F. Schlerhold, Chas. W. Lamar and Louis Osterreleber.

A New Wet Process of Extracting Silver.

According to the London *Mining Journal*, an important advance has been made upon the methods of Augnstin & Ziervogel for the extraction of silver hy the wet process. It is the process of J. F. N. Macay, of Charapoto, Ecuador, which the *Journal* pronounces to be much more effective than the older methods.

"His process relates to the nse of cupric chloride and sodic chloride in solution, for extracting the silver, lead and copper from ores containing all or any of these metals in chemical combination with sulphur, or, in the case of eilver, with chlorine us well as snlphur, or in the case of copper, with chloride and oxygen (cnpric oxychloride), whether these sulphides (or chloride, or oxychloride) may he chemically oombined or mechanically mixed with other mineral in a simple or complex matrix. When cupric chloride csnnot be obtained to commence the proocss with, it may be prepared by mixing together in solution 1,000 parts by weight of cuprio snlphate crystalized, and 469 parts by weight of sodic chloride. The chemical reaction which takes place yields cupric chloride and sodic sulphate; or cupric chloride may be msde by digesting black cnpric protoxide and sodic chloride in sulphuric acid, whereby cupric chloride and sodic and sulphate are formed. Also, hy digesting blsck cupric oxide in hydrochloric acid, whereby water and cupric chloride are formed. The cupric chloride may be made by either of the ahove methods, or by any other method, either in the presence of the ore to be treated or separately, hut hé prefers to make it separately. He also makes it in the presence of the ore when he treats atacamite, or instead of atacamite he uses pure cupric oxychloride, and treats it in the same way, according to the process for making colcothar and cupric chloride, which he has likewise patented.

It is explained that when lead ores are to be treated, and cupric chloride has been prepared by either of the first two ways mentioned, the sodio sulphate formed must be decomposed hy adding a solution of calcic chloride, whereby calcic sulphate and sodic chloride are formed. The calcic sulphate heing insoluhle is separated hy decantation, or by filtering off the liqnid. Thus a solution of cupric chloride and sodic chloride can be obtained free from any sulphate. In treating any other ores the sodic sulphate does not interfere with the process, although he still prefers to decompose it and separate the calcic sulphate which is produced. Rain water should he used for the solutions of the salts of copper and sodium, and for washing the residues. Where rain water cannot be obtained, water acidulated with a little hydrochloric acid may be used, care heing taken when treating silver ore to remove all traces of acid from the residue before treating it with the sodic hyposnlphite solntion. For milling purposes, he uses a kind of arastra or tahona, so constrncted that no metallic part shall he exposed to the action of the cupric chloride, and consisting of a circular base plate of granite or other hard stone cemented togetber and enoircled by a water tight rim, stone mullers being made to rotate upon the base plate.

"According to the first method, the ore is ground and passed through n sieve, having by preference 120 meshes to the linear inch; it is then covered with a strong solntion of cupric chlorlde and sodic chloride in an iron pot glazed iuside. The mixture is concentrated to a pulp by heat. Ahout five parts of onpric chloride are used to one part of sodic chloride. The thick pulp is ground in the arustra (for so it may be called), which is kept heated hy live steam blown iu. This operatiou continues ahout two hours, after which the pnlp is transferred into a leaching wooden vat provided with a wooden stirrer, and is suhmitted to a distinct process, according as the ores under treatment are silver, copper, lead or complex ores. Silver ores treated hy this proces for the silver only generally occurs in nature as sulphide or as chloride of silver, pure, or mixed with native silver or gangue. When sulphide of ores are under treatment, two molecules of cupric chloride, hy giving two atoms of its chlorine to the sulphide of silver, forming silver chloride will have heen converted into cupreous chloride, the sulphur hecoming liherated. The cuperous chloride and some of the silver chloride are kept in solution by the cupric and sodio chlorides in solution. In the leaching vat the liquid of the pulp is filtered off, and the residue is washed two or more times with a solution of sodic chloride, in order to carry off the cupreons chloride left with the residue after the first filtratiou. Then the washing of the residue is continued with hot acidulated water until no more copper salts romain iu solution (which ie ascertaioed by testiug with ammonia), and afterwards with plain water to remove all free acid. After tbe residue has been washed, as stated ahove, and when entirely cold, he proceede, as in Von Patera's prooess—that is, treating the reeidue with a cold dilute eolution of sodic hyposulphite, in order to entirely diseolve the eilver chloride whicb has been left with the residue. The stirrer ehould he kept iu motion during the whole of the ahove operations. After all the chloride of silver has been diesolved, the hyposulphite eolution ie filtered off, and tbe reeidne is repeatedly washed with cold water, until all traces of the eodic hyposulphite (which holde the eilver chloride in eolution) have been extracted from the residue, wbich contains sulphur and the gangue or matrix.

"The silver chloride held iu solution by the sodio hyposulphite solution is transferred into an earthenware or iron pot glazed inside and boiled with pulverized sulpbur in the proportion of about seven parts of sulphur to one part of silver, nntil all the silver of the silver chloride has been precipitated as silver sulphide, leaving in solution the sodio hyposnlphite unchanged and ready, after being dilnted, to he used again. Mr. Macay ascertains when all the silver chloride has been converted into sulphide by a simple process of testing which he describes. The sodio hyposulphite is then separated from the silver sulphide by filtration, and the insoluhle silver sulphide washed. The silver chloride held in solutiou hy the sodic hyposulphite can also be precipitated hy any soln·hle sulphide, as, for example, sodic sulphide instead of with sulphur, whereby silver sulphide and sodic chlorides are produced. The sodic hyphosnlphite is filtered off, and he proceeds to wash the residue, composed of silver sulphide, as before stated. Wheu the silver is precipitated from the hyposulphite solntion in this way by any soluhle sulphide, care must be taken not to put an excess of this last reagent or to neutralize this excess, because if an excess he present, the sodic hyposulphite solution will not be fit for use again until it has been freed from any soluble sulphide, whicb can be readily done by putting more silver chloride into the solution to exhaust the excess of the soluble sulphide. As an alternative process, the residue from the leaching vat, instead of being treated with a cold dilute solntion of hyposulphite of sodium, as in Von Patera's process as already mentioned, may he treated, as in Ziervogel's process, with strong hot brine, in order to dissolve the silver chloride, from which solution the silver instead of heing precipitated in the form of sulphide, may be precipitated in the metallic state by metallic iron, whereby ferrous chloride is at the same time formed.

"The final step is the reduction of the silver sulphide to the metallio state which is thus effected: When sufficient silver sulphide has been collected, it is boiled with cuprid chloride and sodic c·loride, evaporated and in some cases ground in the arastra; the silver chloride produced by this re·action, after being freed of all copper salts, is next dissolved in a hot saturated solution of sodic chloride, which ie separated from the sulphur hy filtration. The sulphnr is dried and pulverized to he used again, and the silver chloride in solution is precipitated hy metallic iron, whereby metallic silver and ferrous chloride are produced. The metallic eilver (cement silver), so formed, is melted into ingots, and the ferrous ohloride is kept for producing colcothar and cuprid oxychloride according to another inventiou. With regard to the treatment of the filtrate from the leaching vat residue, Mr. Macay explains that the filtrate from the leaching vat and the two following brine washings are collected together and hoiled with the metallic copper to decompose the chloride of silver which is held in solution therein and precipitated in the metallic state.

"When all the silver has been precipitated, the liquid is filtered off, and treated as hereafter mentioned, and the precipitate is washed first with hot brine and afterward with very weak acidulated water, to free it from any copper salt, and this precipitated cement silver is then melted into ingots as usnal. As to the last mentioned filtrate the excess of metallic copper remaining after the silver is precipitated is removed from the liquid, which is to he sufficiently diluted with the acidulated water washings that have been used in the leaching vat to precipitate the cuprous chloride, whicb comes down in the form of a white crystalline powder, leaving in solntion cupric chloride (when this salt has been used to excess) and chloride of sodium, which are filtered off from the cuprous chloride, and are ready to be used again for treating fresh ore. The other washings of the leaching vat, which contain very dilute cnpric chloride (when this salt has been used) in excess and chloride of sodium, are concentrated hy any economical means, and used again for the chlorination process. As regards the cuprons chloride precipitate, he first exposes it to the action of the atmosphere in a very thin layer until it has been converted in a cupric oxychloride by the oxygen of the air. He employs the cuprio oxygen so obtained in the production of coloothar, according to his special process, wherehy the cupric oxychloride is at the same time converted back into cupric chloride for nse again iu the treatment of ores. Mr. Macay mentions that silver which is found as a mineral in combination with chlorine is almost entirely soluhle in a hyposulphite solution or in brine, but it is rendered directly soluhle therein when the ore is treated accordiug to the process ahove described for silver sulphide, which process can, therefore, be equally well employed for chloride of silver ores.

"The improved process, as already mentioned, ie applicahle to the treatment of copper, lead and complex ores, as well as eilver; hut theee modificatione need not at present be referred to. Ae applied to treating silver ores, the chief novelty of Mr. Macay's process, considered as a whole, consists in treating the raw ore direct without the nse of mercury, which is very expensive. It has already been eeen that he nvoide the necessity of roaeting, and that it is a regenerative process—the reagente required in one part of the process being reproduced in another part, and Mr. Macay has now added some further improvements ip details by the use of which the filtration, hitherto very difficult, oan be done in three bours; indeed, to euch perfection has he brought this branch of the process, tbat even when the filtrates are in a state of impalpable powder, he can effect the five filtrates in three and one-half honrs. The whole process appears to have much to recommend it, and is likely to come largely, if not exclusively, into use, wherever silver ores are worked."

The Sulphurets Utilizer.

This is the name given to a metallnrgical process invented hy Dr. McGraw, of Boulder, Col. The following description of his method hy the inventor we republish from the Boulder *News and Courier:* "The sulphurets ntilizer consists of an apparatus for utilizing the scums from pulverized ore as it passes from the stamp mill, or pulverizer, to the concentrator, which scum, owing to the light specific gravity of its rich minute particles, has ever floated off upon the surface of water as waste, whioh particles being porous and their cells heing filled with air, prevents them from being precipitated until the action of water ehall have forced the air from out their cells; and it is to meet the reqnisite detention of these particles, until precipitation has taken place, that characterizes the true mechanism of my process. The machine first acts upon the ores by separating the heavy from the light, which it does in n prompt ns well as a heautiful manner, the ore entering a funnel-shaped pan through a pipe directly against the side of the pan, exactly opposite a compressed lip for the exit of the scum, the pan having at its hottom an automatic valve for the discharge of the bulk of the water and all of the heavy portions of the ore, which valve is controlled hy floats in adjacent cylinders communicating with the sides of the pan in such a manner that a constant level is preserved to secure the oonstant discharge of the scum over the depressed lip, from which the scums are thrown into a series of tanks for the settling of the light mineral. To facilitate the scumming process, the pipe that conducts the water and ore to the pan enters below its upper edge and thus curves upwardly aud outwardly so as to direct the entering stream full against the side of the pan, causing a double wave or ripple on the surfaoe of the water, one of which passes to one side of the pan and the other to the other side, so that when these two ripples meet at a diametrical point an outward or radical current is the result, which causes the lighter ores to pass over the depressed lip of the pan and into the tank below. As the light ore is thus thrown into the settling tank with a small amount of water, the water passes off through a series of partitions arraoged with transverse openings, the first near the bottom, the seoond near the top, the third near the bottom, while the fourth compartment, or discharge end of the tank, is controlled by a float valve, whioh maintains a constant level of the water, holds the water quiesoent and oauses the disoharge to be oommensurate with the inflow. It follows that all of the light metals so acted upon by this machine are found precipitated at the bottom of the first aud second compartments of the tank and ready for the smelter, instead of floating down our rivers to be precipitated in the bottom of the sea."

Experiments in Reducing Ores.

Many of the mining districts in this oountry are idle for the reason that, at present, they oannot be profitably worked; the ore is of too low a grade to stand the cost of reduoing it to bullion. But the many and varied experiments which are daily being made, have only one aim in view, that of makiug availahle ore which cannot now he successfnlly worked. Many of these attempts result in failure, it is true, and some of the ideas advocated ure not based on sound scientific principles. This is to he expected and no possihle harm can come of it. It took long years of weary toil—and many were the failures experienced—before many of those agents were brought into general use which have done so much to help along the advance of civilization. But the right man took hold of it at last, and since then it has been plain sailing. There are vast tracts of this low-grade ore waiting for tbe time to oome when genius aud capital combined will have solved the problem. That that time will oome there is not the slightest doubt. Even now the cost of redncing mineral has been wonderfully rednced and is heing all the time. Mining is a great industry, probahly as important ae there is in the world to-day, and any one who helps to advance that industry generally makes a fortune for his pains, that is, should his idea come into general nse, which it is bound to do if it is an improvement on the methods in vogne before his diecovery. Tberefore, all this experimenting which is going on in the mining world cannot bnt redonnd to the benefit of the industry and open np new fields for work which have so long remained idle for tbe want of means by which to add their great deposits of wealth to the world's etore.—*New Mexican Mining News.*

THE receipts of New York Hill at Grase Valley for the fiscal year ending July 29th, were $230,000, and the disbursements $235,000, inclnding $108,500 in dividends to stockholders. The amount of cash on hand at the close was $12,476, a decrease of $5,300 as compared with the balance carried over from the previoue year.

THE Southern Utah towns are nearly all depopulated of men, by reason of the demande of the railroads now being oonstructed in that part of the Territory. Good wages and prompt pay are great inducments to them.

Arizona Gold Mines.

The attention of prospectors and capitalists in Arizona, has been turned for the most part to silver mining. Its extensive and rich leads of that character of ore, and the generally low grade of the gold ore, as well as the suspicion that the gold would turn into silver when depth was attained have been the canses. There are in this district, a few miles northwest of Globe, numerous veins of gold-bearing quartz, and from the gulches in that vicinity a great deal of nugget gold has heen obtained. The veins are frequently of fair size, and the ore is of a higher grade than many of the most successful gold mines of the Pacific Coast has produced. In Maricopa county, the Vulture mine is worked successfully, though it is a long distance from watcr, and the average of the ore is $8. It pays dividends. The cost of reducing is said to be $2 50 per ton. There are nnmhers of gold mincs in Southern Arizona, some of whioh are beginning to attract attention. In Yavapai county are, without douht, the richest and best defined gold leads in the Territory. At the upper end of what is called the Tonto Basin, there are several excellent properties among which the Nash, the Excnrsion and the Gowan are the best known, and most developed. All of these are in good formation, are certainly fissures, and carry high-grade ore; the Nash particularly so. In Yuma county there are a great many gold mines, and its placer mines have yielded more than all the rest of the placers of Arizona. We hope soon to see our gold mines. gaining the attention their great extent and merits entitle them to.—*Silver Belt.*

CALAVERAS MINING INTEREST.—The mining interest in this vicinity has heeu improving steadily for the past few years and still continues to prosper. It is evident that the fact is being realized that wealth still exists iu the gravel hills, and that the old river channels have not heen completely robbed of the precious metal. Claims which were abandoned iu former years and thought to be worked out have heen undertaken again, and, with sagacious management, are heing made remnnerative property. There is not an acre of land, to our knowledge, in this vicinity where there is any prospect of the existence of auriferous matter, even in small quantities, which is not claimed. The various gravel channels whose courses through the hills can he pretty accurately traced hy those familiar with the country and the mining of former years, are now considered worth looking after. They have not heen worked out hy any means. More gold hy far than has ever beeu taken out still lies buried iu the depths of those channels, and with the facilities now obtainable for conducting mining operations, they will he made to yield their wealth.—*Calaveras Chronicle.*

MILL SITES AND LODE CLAIMS.—The Commissioner of the General Land Office, in a letter to a Register aud Receiver, says: I am in receipt of your letter Section 2337 U. S. Revised Statutes provides: "Where non-mineral land not contiguous to the vein or lode is used or occupied by the proprietor of such veiu or lode for mining or milling purposes, such non-adjacent surface ground may be embraced and included in an applicatiou for a patent for such vein or lode." The language of the statute is plain nud unambiguous, and I am of the opinion thut u proper constructiou of it requires the applicant for u patent for a lode aud mill site to furnish satisfactory proof that the tract of laud applied for as a mill site is non-mineral in character, and that it is used or occnpied by the proprietor of the vein or lode to which it is appurtenaut for mining or milliug purposes, and the proof should consist of the affidavit of the claimant corroborated by disinterested witnesses cogniZant of the facts.

THE SPEED OF VESSELS.—Ensigu Hogg of the navy has invented a speed indicator for veseels, which has heen found to work satisfactorily. The device consists of a tin fnnnel, shaped like an old-faebioned dice-box, open at both ends. Froms it extend four hollow metel tnhes meeting ahout six inches from the funnel nnd ending in a rubher tuhe whicb is several yards in length, and has the other end fastened to an arraugement on deck which looks like a barometer, but so constructed that the mercnry is not effeoted by climate change or capillary attraction. The speed of the vessel causes the water to rush through the cylinder and suck air out of the tubes. This makes the mercury rise in the glass, and a graduated scale shows exactly the speed of the vessel.

CURIOUS PROPERTIES OF MAONETIC IRON.—A curious magnetic property of the meteoric iron of Santa Cattariuu (Brazil), hus heen lately observed hy Professor Lawrence Smith. of Louisville. Small detached fragmeuts uot weighing more than 0.1 to 0.5 graine were very weakly affected by a maguet; but, on heing flatteued on a piece of steel with a steel hammer, they hecame very sensitive to it. By heating red hot, the particles were made to he still more easily attructed thau hy flatteuiug. The meteoric iron in queetiou contains 66 iron, 34 nickel.

AN American writing from Mexico eays of the Mexioo mining laws: The nniversal verdict is, that they are very generous and faultless, and are in every case eo interpreted by those in power. The local lawe are promptly administered, and that without delay or cost to any one of tbe partiee concerned. A foreigner has all the protection he can desire.

The Engineer.

Conditions as a Factor in Engineering.

In plotting out work of an original character and design, an engineer is greatly dependent upon precedents. The particular behavior of this or that detail cannot be foretold, and the only reliance he can have for the success of his plans is a knowledge of what the action of similar parts has been under conditions akin. Where there are no precedents his sagacity must act in lion of precedent, or rather his mechanical faculty must assert itself and rise superior to it. It is thus that new works are originated, and it is thus that bold schemes fail. When they succeed it is for the reason that the constructive faculty of the originator told him that they would. When they fail the converse is true; too much was assumed of the action of certain parts, and too little allowance made for a change in the conditions. And it is here that the pertinency of our caption appears—nothing in the range of the profession is more fickle than conditions.

A balanced slide valve under 50 lbs. pressure works harmoniously and satisfactorily; but under 100 lbs. pressure there may be difficulties which prevent its action. A certain size of cylinder, with a certain length of stroke, operates a given shaft at 50 revolutions per minute without heating; but ran the speed up to 75 revolutions per minute, and troubles begin at once. The difficulties encountered are caused by a change in the conditions, not in the function of the machine, and they are often baffling in the extreme to locate and remove.

The observations just made in regard to engines apply equally to boilers, or any other appurtenance, particularly to boilers, for we have more to learn about them than any other detail of the business. Why, of two boilers of stated capacity and precisely similar design, one should evaporate more water than the other under apparently identical conditions, seems mysterious on the face of it; but searching investigation will reveal the cause to be a change in the conditions under which the respective boilers are worked.

The practical application and value of our articles lie in the fact that a change of the conditions a machine works under, will often utterly destroy its value for any other than a specific duty. To adapt it to others, a different arrangement of details is required. These changes are sometimes so great as to amount virtually to making another machine.—*Ex.*

A Railroad in the Tree-tops.—It may not be known outside of the neighborhood where it is situated, but it is nevertheless a fact, that in Sonoma county we have an original and successful piece of railroad engineering and building that is not to be found in the books. In the upper part of this county, near the coast, may be seen an actual roadbed in the tree tops. Between the Clipper mills and Stuart's Point, where the road crosses a deep ravine, the trees are sawed off on a level and the timber and ties laid on the stumps. In the center of the ravine mentioned, two huge redwood trees, standing side by side, form a substantial support and they are cut off 75 ft. above the ground, and cars loaded with heavy saw logs pass over them with as much security as if it were framed in the most scientific manner. "All roads lead to Rome," except this one. The builders never contemplated a terminus at San Francisco, Petaluma or Chicago, but merely to convey heavy timber from the woods to their mill. There are many places in our redwood forests where this example might be followed profitably, as it would be cheaper to grade through with a cross-cut saw and lay the ties on the stumps than to remove the trees. We can boast of a broad-gauge, a narrow-gauge, and a road in the tree tops—yet we are not all happy.—*Petaluma Argus.*

Drainage of the Zuyder Zee.—It seems that the Government of the Kingdom of Holland is determined to conquer the Zuyder Zee, which has an area of 20,000 hectares. The engineers in charge of this work have been engaged for the last 10 years preparing the plans, the total cost of which is estimated at least $46,000,000. The dyke will be 41 kilometers in length, and will extend from the city of Enkhuisen to the coast of the province of Overyssel. The top of the dyke will be built to the hight of five meters above the level of the sea, which will bring it 2.05 meters above the highest tide. The dyke will be formed from sand and faced with clay. It will be built of sufficient size to resist the heaviest seas. The work will be started at four different points, and is calculated to be completed in from seven to ten years.

Connecting the Bay of Biscay with the Mediterranean.—M. Lepinay has drawn up his report regarding the canal to connect the Bay of Biscay with the Mediterranean. He proposes that the canal start from Bordeaux, and after traversing 252 miles, terminate at Narbonne. The number of locks would be 62, and long enough to admit vessels of 439 ft. in length. The depth would be 27 ft. 9 inches, and the breadth at the surface where the canal is to be of single width, 184 ft., and where it is to be of double width, 262 ft. The estimated cost is $110,000,000. By means of this canal ships using steam can go from sea to sea in 54 hours.

Useful Information.

Paper Blankets.—By a recent invention the domain in which paper plays its part in the general economy of things has been materially widened. To a Manchester firm of the name of Henry & Leigh Slater, says the *British Trade Journal*, belongs the credit of utilizing paper in this especially serviceable direction. At once cheap, cleanly, warm, light and easily manipulated, paper seems expressly designed for the purpose to which it is now for the first time successfully applied. Of late years various attempts have been made to turn it to account in the manner described; but, owing to the crackling nature of the paper and the impossibility of securing free ventilation beneath paper coverings, the idea was abandoned again and again. In the production of the "Chartaline" blanket, as the new invention is called, these defects have been overcome in a most satisfactory manner. Ventilation is obtained as full, free and perfect as takes place beneath an ordinary woolen blanket. The new bed covering is made of two sheets of paper, between which a layer of wadding, chemically prepared, is inserted in such a way that it cannot gather together in lumps. The edges are strongly whipped, so that there is no possibility of a separation of the two pieces taking place. The paper is manufactured from the strongest fibre known, which, being softened by a special process, is free from the objectionable crackling and rustling sound that, as a rule, accompanies the manipulation of paper. It is true there is a slight crisp feeling when new, but this soon wears off and the coverlet becomes soft and limp. At the same time, the strength of the "Chartaline" blanket is much greater than might be imagined, having regard to the character of the material from which it is manufactured. As far as looks go, the new blanket has all the appearance of a woolen one, while the warmth it affords exceeds that of its predecessor when the size and weight of the two are brought into comparison. The trifling cost at which these serviceable articles may be obtained constitutes, however, when all is told, the chief advantage of the invention.

A Curious Gas-producing Substance.—The gas-producing substance—a kind of sun-baked clay, of a light brown color—recently found in Mexico exhibits, on analysis, the following chemical composition: Moisture, 2.71; hydrocarbons, volatile at a red heat, 71.00; fixed organic carbon, 8.99; ash, 17.30. The ash is constituted mostly of grains of quartz, and the hydrocarbons—much larger in quantity than is afforded by the best bituminous coals—gave, when burned, a clear, luminous flame, apparently free from sulphur vapors. Distillation affords a red oily substance, of nearly the consistency of butter and having a very offensive odor, which, however, is not perceived when burned. The origin of this mineral is not clear, but is thought to be due, probably, to causes similar to those which originated the oil-bearing strata of Pennsylvania. It is assumed that, in such instances, gaseous hydrocarbons are formed from the decomposition of organic remains, which become liquid under pressure, and the liquid is readily absorbed by disintegrated rock or quartzose sand. The structure of this substance is said to show lamination—proving that it has been under great pressure.

Fired by Electricity.—An interesting illustration of the danger attending the manufacture of some kinds of rubber goods was shown in the origin of the recent fire which occurred in the Ætna Rubber Mills, at Jamaica Plains. The cement which fastens the seams of rubber coats is largely made of naphtha. The mere act of lifting a piece of rubber cloth from a pile of half a dozen similar ones, cut for garments, developed so much electricity that a spark was observed to escape. It came in contact with the naphtha cement, or with gases arising from it, and instantly the whole room was in a blaze. Fortunately, the fire was extinguished without destroying the mill, the loss being about a thousand dollars. It is not known that anything can be done to prevent the occurrence of another accident of this kind, whenever all the atmospheric conditions are favorable. One would suppose, however, that a certain degree of dampness would remove all danger from that source.—*Boston Commercial Bulletin.*

Delicate Iron Work.—The precision to which scales and tools are now made is most wonderful. A bolt has been made to fit so delicately into an opening in a piece of iron that when the bolt has been held for a short time in the hand, the expansion is so great that it cannot be made to enter except by the use of much force; yet, when at the normal temperature, its own weight will settle it to its seat. The scales used for weighing gold in the Assay Office at New York are so delicate that, when brought to a balance with two pieces of paper of equal size in the pans, the mere writing of a name with a lead pencil on one of the pieces of paper will add enough weight to the paper to turn the scales in its favor.

Intermittent Electric Light.—A French electrician has devised a form of electric lamp by which intermittent luminous signals can be produced. A cam motion is used, by which the carbons are separated at each revolution, and can be operated by clock-work for regular signals or by hand, at a variable rate, for the irregular ones.

The Sand Blast.—Among the wonderful and useful inventions of the times is the common sand blast. Suppose you desire a piece of marble for a gravestone, you cover the stone with a sheet of wax no thicker than a wafer; then you cut in the wax the name, date, etc., leaving the marble exposed. Now pass it under the blast, and the sand will cut it away. Remove the wax and you have the cut letters. Taking a piece of French plate glass, say two by six ft., cover it with fine lace and pass it under the blast, and not a thread of the lace will be injured, but the sand will cut deep into the glass wherever it is not covered by the lace. Now remove the lace and you have a delicate and beautiful figure raised upon the glass. In this way beautiful figures of all kinds are cut in glass, and at small expense. The workmen can hold their hands under the blast without harm, even when it is rapidly cutting away the hardest glass, iron or stone, but they must look out for finger nails, for they will be whittled off right hastily. If they put on steel thimbles to protect the nails, it will do little good, for the sand will soon whittle them away; but if they wrap a piece of soft cotton around them they are safe. You will at once see the philosophy of it. The sand whittles away and destroys any hard substance, even glass, but does not effect substances that are soft and yielding, like wax, cotton or fine lace, or even the human hand.

A Large Monolith.—At a granite quarry in Westerly, Rhode Island, there was recently detached a monolith 150 feet long, 10 feet wide, and 8 feet thick, weighing over 1,000 tons. These dimensions greatly exceed those of the Obelisk of Semiramis, the largest of the Egyptian monoliths. The stone was loosened by one oblong blast-hole in such a simple and perfect manner that the theories and conjectures advanced by many as to the methods of the Egyptians appear absurd. It contains over 12,000 cubic feet of granite which, cut into smaller blocks, will fetch about $30,000. Mr. French, the engineer in charge, is quite positive that it could be taken to New York city, finished as an obelisk, and erected for about $150,000.

Potato Flour, or the dried pulp of the potato, is attaining great importance in the arts. It is stated that in Lancashire, England, 20,000 tons of it are sold annually, and it brings at present in Liverpool about double as much in the market as wheat flour. It is used for sizing and other manufacturing purposes, and when precipitated with acid is turned into starch. When calcined it is employed as a dressing for silk.

Graphite as a Conductor—Herr Muraski finds that graphite is better than any other carbon, and that its resistance is also most sensitive to variation of temperature.

Ice as a Burning Lens.—A glass globe full of cold water, or even a lump of ice, will, in the sun's rays, act as a burning lens.

Good Health.

How Milk Should be Taken.

Milk is a food that should not be taken in copious drafts, like beer or other fluids which differ from it chemically. If we consider the use of milk in infancy, the physiological ingestion that is, of it, we find that the sucking babe imbibes little by little the natural food provided for it. Each small mouthful is secured by effort, and slowly presented to the gastric mucous surface for the primal digestive stages. It is thus regularly and gradually reduced to curd, and the stomach is not oppressed with a lump of half-coagulated milk. The same principle should be regarded in the case of the adult. Milk should be slowly taken in mouthfuls, at short intervals, and thus it is rightly dealt with by the gastric juice. If milk be taken after other food, it is almost sure to burden the stomach and to cause discomfort and prolonged indigestion, and this for the obvious reason that there is insufficient digestive agency to dispose of it; and the better the quality of the milk, the more severe the discomfort will be under these conditions.

Milk is insufficiently used in making simple puddings of such farinaceous food as rice, tapioca and sago. Distaste for these is engendered very often, I believe, because the milk is stinted in making them, or poor skimmed milk is used. Abundance of new milk should be employed, and more milk or cream should be added when they are taken. In Scottish households this matter is well understood, and a distinct pudding plate, like a small soup plate, is used for this course. The dry messes commonly served as milky puddings in England are exactly fitted to create disgust for what should be a most excellent and delicious part of a wholesome dinner for both children and adults.—*Popular Science Monthly.*

The Appetite of Bread.

Did you know that bread was not only eaten but eats? Darwin has told us that some flowers enjoy a porter-house steak. Now M. Scheurer Kestner assures us that bread has a partiality for hogs and hominy. This discovery is interesting to dyspeptics, for bread can be made to do the work of the alimentary canal and relieve dyspeptics of all bother except mere deglutition—and of course, paying the baker's bill, which is harder work than digestion. Science has since found that several vegetable juices or saps dissolve meat, but M. Scheurer Kestner is the first person who observed that in the process of bread making a peculiar fermentation takes place which produces complete digestion of meat. A beef steak hashed fine and mixed with dough containing yeast disappears entirely by the time the bread is taken from the oven. The steak's nutritive principles are dissolved and incorporated into the bread. Not the least curious phenomenon noticed in these circumstances is that meat, which so rapidly becomes putrid, when once incorporated into bread may be kept longer than ordinary bread. Bread made in 1873 has been shown the Academy of Science; it was as sweet and free from mold as when it came out of the oven.

At first M. Scheurer Kestner used raw meat; he mixed one and one-tenth pounds of flour, one pound of leaven and three-fourths of a pound of raw beef minced fine; water in sufficient quantity was added, and the dough was left to ferment. In two or three hours the meat had disappeared. The bread was then baked as usual. This meat bread had a disagreeable, sour taste. To remove it M. Scheurer Kestner first boiled the meat in just the quantity of water necessary to wet the flour and used this water in kneading. The meat should be rid of all fat, and only salt enough to season the bread added; for if too much salt be added the bread will become humid (salt being a great absorber of water) and spoil. The objection to this bread is that it is insipid. If bacon be used instead of beef the objection is removed. Veal, too, makes a delicious meat bread. All these breads may be used to make soup. Cut in slices one-sixth of a pound of this bread, put the slices in a quart of water, salt to taste and boil for 20 minutes.—*New Orleans Picayune.*

Deaths from Industrial Pursuits.

Some startling facts respecting the amount of sickness and death which result directly from the circumstances under which industrial pursuits are carried on, have lately been discovered in England, where they have been brought to the attention of the authorities as a subject worthy of investigation with the view of amelioration. One statistician who compiled tables on this subject in 1877, giving the records of deaths and injuries by steam boilers, in mines, on railways and in factories, estimated the mortality in England from these causes, during the four years preceding 1877, at a total of 107,000 men, women and children; and he estimated, on the basis of these facts, that 500,000 workmen will lose their lives during the ten years from 1877 to 1886, from the following causes, namely, 300,000 in mines, 70,000 on railways, and 130,000 in factories.

Another writer on the same subject, criticising these figures, thinks they are altogether too small, and that the accidents reported comprise only a small part of those that actually take place. He is of opinion that not less than 100,000 persons are annually killed in England from causes directly resulting from the industrial occupations in which they are engaged.

These statements, which are doubtless based on reasonably accurate data, are sufficiently appalling to arouse from its traditional *sang froid* even so inert and conservative a body as the British House of Lords. Taking even the lowest estimate of mortality from industrial accidents as the safest basis for estimating the number of yearly deaths from such causes the world over, and it will be found that the "horrors" of war, with its reckless sacrifice of human lives, become far less horrible when a comparison of the number of victims is instituted.

How Koumiss is Made.

This article, sometimes called "milk wine," or "milk beer," which was sold quite extensively in this city some two or three years ago, and which has recently formed an important article of diet in the critical case of President Garfield, is made as follows: Into one quart of new milk put one gill of fresh buttermilk and three or four lumps of white sugar. Mix well and see that the sugar dissolves. Put in warm place to stand ten hours, when it will be thick. Pour from one vessel to another until it becomes smooth and uniform in consistency. Bottle and keep in warm place 24 hours. It may take 36 in winter. The bottles must be tightly corked and the corks tied down. Shake well five minutes before opening.

It makes a very agreeable drink, which is especially recommended for persons who do not assimilate their food, and for young children may be drunk as freely as milk. Instead of buttermilk, some use a teaspoonful of yeast.

It is the standard beverage of the Tartars, who almost live upon it in summer, and is also used largely by the Russians.

Caution.—The richer your milk, which should be unskimmed, the better will be your koumiss.

Professor Stevenson, of the Smithsonian Institute, is organizing at Fort Wingate, his geological and surveying party. The Professor's work for the present will be the establishment of a base line 12 miles in length, to be used in triangulation. A number of naturalists and special scientists are included in the party, and they will explore the western part of New Mexico and the eastern part of Arizona.

Passing Events.

The country has passed through a week of anxious expectancy owing to the crisis in the case of President Garfield. He has passed the turning point safely, however, and is now apparently on the high road to recovery.

We devote a large share of our space this week to an exhaustive article descriptive of the cable railroad system of San Francisco. To railroad engineers this is of special interest, as this cable system has been so successful here, it will no doubt come into vogue elsewhere. In fact, in Chicago, a road is now being built to be operated by endless cable. The details have all been worked out here with great care, and many obstacles overcome.

We also give space to a complete catalogue of the Mechanics' Institute Fair, now open in this city, and give descriptions of many prominent exhibits.

Our mining summary gives all the recent news of interest from mining regions. In this State, many hydraulic mines are now shut down, owing to the injunctions; but otherwise the mining interests are very prosperous.

THERE is great excitement in Georgia over reported gold discoveries.

Mining Machinery at the Fair.

Although the display of mining machinery at the fair this year is not extensive, since none of the large foundries are represented, yet there are several new things of interest to mining men, and these we briefly describe in the following paragraphs:

Mr. Frank A. Huntington has several things on exhibition, all of them interesting to mining men. The oscillating quartz mill we have before illustrated and described in detail. It is now in use in many places on the coast, and is no longer an experiment, having stood the test of practical work in a number of localities for over a year. It has no stems, cams or tappets, and both crushes and grinds the quartz.

Mr. Huntington's grinding and amalgamating pan, recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, has attracted considerable attention. On the vertical sides of the pan, near the bottom, are supported dies, in sections, but like a complete ring, so as to receive the action of the revolving shoes, which are journalled upon vertical spindles. When these are driven by the action of a revolving muller, the shoes are thrown outwardly against the dies, both by centrifugal action and by the resistance of the contents of the pan to wings which project inwardly from the shoe supports. Suitable means are employed to keep up a good circulation in the pan. There is no danger of grinding or flouring mercury with this pan. More or less grinding action may be maintained.

Mr. Huntington has also on exhibition the Patten rocking and panning amalgamator which he manufactures for saving fine or coarse gold and floured quicksilver. This machine consists of a rocking bed having an amalgamated surface, and the pulp is compelled to pass between two amalgamated surfaces, one above and the other below, so that "float gold" and floured mercury is amalgamated.

The Patten concentrator, also made by Mr. Huntington, combines the rocking and percussion motion, which allows it to be set up with the pulp or gangue discharge end highest—the reverse of other concentrators—and by this means it is less liable to carry off the mineral with the gangue, and it is enabled to do good work. This, as well as the other machines here described, should be seen and carefully examined by mining men to be appreciated. Mr. Huntington's shop is at 220 Fremont street.

Brinckman's quartz crusher and pulverizer is the first one of the kind ever exhibited. It has a capacity of one ton per hour, fine enough to pass through a No. 40 screen. The mechanism is simple, and it takes 10 horse-power to drive the machine, the ore being run through either dry or wet. All the machine's parts that are subjected to wear and tear can be replaced, and the wear and tear will be almost the same as to a common stamp mill. The machine works without much noise, and when crushing dry, causes little dust. The principle of the machine is that of a semi-circular mortar, the bottom of which is formed like the grate bars of a furnace, for the ground ore to pass through. The mortar is lined with shoes, and made of white iron. On these shoes are placed solid cylinders of white iron. On these cylinders rests a cylindrical muller of about 3,000 lbs. weight, this being shod with white iron. The muller is provided with a lever, through which an oscillating motion is imparted to the same. Through the center of the muller lengthwise passes a shaft, extending on both sides sufficiently to allow the admission of bearings. On these bearings wooden-pressure beams create an elastic action, making it possible to cause a pressure of 50,000 lbs. or more on the muller when in operation. A peculiar feature of the bearings is that they slide from one side to the other, throwing the center of the shaft from its fulcrum, and creating thereby an eccentric. Several patents on this invention have been procured through the MINING AND SCIENTIFIC PRESS Patent Agency, and others are pending.

Matheweon's patent circular-rotating cam and straight-stamp quartz mill is a device patented not long since through the MINING AND SCIENTIFIC PRESS Patent Agency. The whole frame and all is of iron, and the machine is in very compact form. It can be transported readily, the heaviest piece weighing 600 pounds. The small size (or No. 1 mill) contains 6 stamps, weighing 150 pounds each, making 600 drops a minute. The next size (No. 2) has 10 stamps, weighing 300 pounds each, making 1,200 drops a minute. The little mill at the fair has been carefully examined by a great many mining men.

Dodge's rock breaker, which is on exhibition, is so well known that it needs no special description. There are many hundreds of these breakers in use all over the coast.

Mr. Tustin exhibits a full sized working machine for crushing ore, which is made after his patent. It is an ore pulverizer with automatic feed hopper. We shall before long give a detailed description of this ore grinder, which has been examined with great interest by mining men.

C. Douglas Brown's safety attachment for mining cages, exhibited by Reynolds, Rix & Co. of 49 Fremont street, is a device just patented through the MINING AND SCIENTIFIC PRESS Patent Agency. We illustrated and described this machine in detail a few weeks ago. A full-sized cage with the safety attachment is exhibited.

The Richmaun rock drill and air compressors (patented through the MINING AND SCIENTIFIC PRESS Patent Agency) which are exhibited, we have already described in detail and illustrated in these columns. The company are manufacturing various sizes of these machines, which have now been successfully introduced in several places. The air-compressor mechanism is very effective, and as we have before stated, the drill is a marvel of ingenuity, and one of the most perfect specimens of mechanism ever perfected on this coast.

Stanford's ore mill, invented by the originator of the first of the automatic ore feeders, is a curious looking and operating arrangement. The muller or stamper is a large piece of iron with four removable shoes, which form legs to the muller. This muller has a vertical arm extending upward, by which it is revolved. The revolution causes the muller to oscillate and revolve both, and the shoes in turn strike a solid heavy blow on the quartz in the mortar, crushing it very fine, and at the same time giving it a grind. Mining men examine this machine with considerable interest.

Prominent Exhibits.

Curves on Cable Railroads.

Anderson & Green exhibit a very ingenious yet simple arangement for carrying cable railroad grips around curves in the road. In the cable railroad system in vogue in the city, where the grip connected with the dummy passes down through a slot in the road bed to connect with the moving cable, it works well as long as the road is in a straight line; but on rounding curves difficulties are met with, as pulleys have to be put in to take the strain off the cable, and the grip will not go over the pulley. Anderson & Green overcome this obstacle in an ingenious yet simple way. Pulleys are placed two ft. apart all around the curve, and in the grooves of these pulleys the cable runs. Each pulley has a lever on each side of it. As the grip comes along on the cable it strikes a lever which throws the pulley back out of the way, so the grip clears it. As soon as the grip has passed the pulley, it strikes the other lever which throws the pulley out again and locks it there, this action being repeated at each pulley. The operating mechanism for the levers is positive and simple. The grip passes around the curve without the possibility of striking any of the pulleys, while at the same time the pulleys maintain the cable in its proper position. It only needs a two-foot excavation for this arrangement, and the expense for a double cable is only about $300. There are no extra cables, no stops or lugs and no springs. The pressure of the cable pulls the pulley back, and the lever throws it out again by a positive motion. The inventors inform us that the system has been endorsed by the leading engineers of this city.

New Sewer Gas Trap.

The Titus sewer gas trap, a new invention, is intended to isolate dwellings from the main sewer, thus preventing the prolific cause of disease arising from sewer gas infections. It is simply a peculiarly constructed valve, fitted in a curve in the side sewer connecting the house with the main one. The valve is arranged so that everything from the house can pass out, but no gas or back flow from the sewer can return. In this city this is particularly useful, since the trap acts as a tide-gate, preventing water from entering cellars from the sewer when the tide is high, in the lower portion of the city, when houses are on made ground. It also operates as a flushing-gate to completely clean side sewers. By opening the cover and holding the valve down (and it is constructed with this in view) water is backed up, and by releasing the valve, a sudden flow or rush of water, cleans the side-sewers. This invention is worthy of careful examination by all property owners. It can be seen in the pavilion, or at 1006 Mission street.

An Advertising Clock.

William Akin, of 303 Eddy street, has devised a most ingenious system of advertising, in the shape of an advertising clock, on which he has been at work for some two years or more in order to perfect it. It is automatic in its action. The clock is set up in any public place—such as railway stations, depots, waiting-rooms, etc. Below the face of the clock is a space in which fits the advertisement. This advertising card remains there one minute, when the mechanism releases it and it drops into a similar space below, a new card taking its place. This in turn, at the end of the next minute, drops, and the lower card then disappears and is brought up again behind the others, ready to take its turn again in front. In this way, a new card is displayed every minute in the upper space. The mechanism for changing the cards is quite ingenious. In fact, the whole idea is a good one, as a means of advertising several things in the same space is gained. The inventor is desirous of selling rights.

New Filter Faucet.

THE Challenge filter faucet, patented through the MINING AND SCIENTIFIC PRESS Patent Agency, some little time since by W. M. Sack, is self-cleansing, and in cities like San Francisco and Oakland, where the water contains more or less foreign substances in suspension, it is specially useful. It cannot leak since there is no grooved joint, but instead a simple compression. If a large flow of water is wanted it need not pass through the filter. Through it, however, one can get a glass of pure, clear water, free from filth, bugs or worms.

J. H. Therien exhibits in the machinery department a windmill of very ingenious construction. The fans or wings are of metal and are peculiarly curved. They are so arranged as to automatically open and close as the wind increases or decreases, and in a strong wind remain open, so no motion is imparted to the shaft. The working model is well made, and shows many points of excellence. We shall shortly illustrate and more fully describe this invention.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.]

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

PROJECTILE.—Howard Carr, S. F. Dated Aug. 23, 1881. No. 245,994. This invention relates to certain improvements in projectiles for guns, and it consists in a novel formation of a projectile having the cannelures or grooves formed around its base in spiral lines, which extend to a point near the center of the bullet, where they disappear in a rib on the rear part of the smooth portion of the bullet, which smooth portion continues from that point to the apex. The object of this invention is to provide an opening or openings around the base of the bullet, by which the pressure of the gas will be exerted toward the axis around the rear portion of the bullet, where the explosion of the powder takes place, and thus prevent such an upsetting of the bullet as to cause too great friction within the barrel of the gun. It also serves to distribute the lubricant thoroughly over the space occupied by the cannelures or grooves upon the bullet and within the barrel.

HEADER.—M. N. Laufenberg, assignor to Baker & Hamilton, S. F. Dated Aug. 23, 1881. No. 246,157. This invention relates to certain improvements in that class of apparatus employed for harvesting grain, known as "headers." A difficulty arises when the driving gear is rigidly secured to the axle, on account of the end play of the parts, which often breaks the gear by the forcible contact with the pinion. The inventor overcomes this by a peculiar method of securing the gear to the hub, so that while forced to revolve with the wheel, it will be allowed side play sufficient to relieve it of all this strain.

DESULPHURIZING AND CHLORIDIZING FURNACE.—T. J. Bell and N. A. Griffith, Grantsville, Nev. Dated August 23, 1881. No. 245,991. The object of this invention is to provide a furnace in which the ore will be gradually roasted, being made to travel toward the heat. In connection with this furnace is a peculiarly constructed pulp vat. It would be difficult to intelligently describe the details of this furnace without the aid of engravings.

Our Extra Edition.

This number of the MINING AND SCIENTIFIC PRESS consists of 24 pages, and every page has more or less of interest to the progressive industrial reader. We devote a great deal of space to a very complete description of the cable railroad system which had its birth in this city, and which has fully developed here. We have had a number of engravings prepared for this article which not only fully illustrates the system, but also the various attempts made in that direction before it was perfected. To engineers this illustrated article will be of great value. The tables accompanying it show the details of cost, expenses, etc., with great clearness.

We also give a complete catalogue of the Mechanics' Institute Fair now in progress in this city, and descriptions of many of the prominent exhibits. The usual correspondence, miscellany, etc., is given. Want of space has compelled us to defer publication of several articles which we had intended for this number.

Cable Roads.

(Continued from Page 145).

In 1865, Mr. Beach made some improvements in his chain and in the rails in which it moved; also, in the forked arms for catching the chain. Mr. Beach took out 6 patents on this system.

In 1866 7, Charles F. Harvey, United States, proposed using ropes, with bulbs or ferrules on them, to catch the arm projecting from the car. He drags the rope through an open tube and places hardened rings around them to prevent wear. The rope runs on the surface of the road under the car. He also proposed an elevated railroad with the track supported on the tops of columns—the cars to be drawn by a moving rope, with bulbs or ferrules on them, a long spiral spring intervening, as in Foster and Brown's arrangement, 1859 (Figs. 4 and 5.)

In 1867, Mr. J. A. Fountain proposed a cigar-shaped balloon with machinery and wheels with deep grooves running on wire ropes stretched on supports, the weight of the car being counter-balanced by the buoyancy of the balloon.

In 1869, G. F. Beanregard, United States, proposed some modification in the invention of Foster and Brown's elevated road of 1859, relating to the clamp or grab to catch the overhead traveling rope; and Sutton and Crowell made some improvement in the mode of connecting a rope with knots or protuberances with the car, using a sprocket wheel for this purpose. (Figs. 6, 7.)

In 1869, W. M. Smith, United States, made some improvements in elevated railways, and during this and the following year, several other inventors took out patents in England and the United States for improvements in elevated railways.

In 1870, Walter Hyde invented an elevated railway, using two wire ropes and a bucket, or car suspended by sheeves on the upper one and by means of a drum on the basket worked by the occupants, and around which the lower rope was placed, the car was caused to be propelled along the upper rope. (Fig. 8.)

In 1872, Mr. Abel Thompson, United States, proposed to run a locomotive in a tunnel underground, and to connect it with a car running on a track in the street by means of an arm running up through an opening in the crown of the tunnel. With this exception, all the recent inventions seem to relate to elevated railways, and a great many patents have been granted thereon; and such is the history up to the time that

Andrew S. Hallidie, of San Francisco,

Matured his system of cable roads now in use in this city. His first patent for a grip pulley was granted in 1870, and after that time he took out a great many patents on cable railroads. He matured his system in 1871, but met with no encouragement and considerable obstacles; but in 1872 he interested some friends in the project and they decided to take hold of the matter with him, built an experimental line on Clay street which demonstrated the practicability of his system.

In the construction of this line Mr. Hallidie gave his close and personal attention, and Mr. Wm. Applesheimer, who was then in his employ as draftsman, was continued by him in the service of the Clay St. Hill Railroad Co., which consisted of Messrs. Britton, Davis, Moffit and Hallidie.

But few inventions of any merit are free from attack, and although they may have been but a short time before considered chimerical and impracticable, as soon as their value is proved there are no end of people who are ready to claim the merit of the discovery, or to openly infringe the patent. And it has been so in this case. When Mr. Hallidie first broached the subject of the railway to his friends, it was generally scouted as being impracticable and visionary; and but for the confidence felt in his ability by the three gentlemen afterwards associated with him in the construction of the Clay St. Hill railroad, it is likely that to-day the cable system of street railways would have been still resting in his brain.

For over three years the Clay St. railway continued to run, carefully watched and strengthened by the inventor, and each improvements made in details as were found necessary from time to time; and after it was an admitted success and the experimental stage had been passed, then other parties were willing to step in and try and reap some of the benefits.

The Sutter St. Railway Co., under Mr. Casebolt, was changed from a horse to a cable railroad, in violation of the patent laws, and resisted suit of infringement until the United States court found judgment against them in favor of Mr. Hallidie's patent, after expensive and vexatious litigation.

In like manner the Geary street railway was built under the direction of Mr. Applesheimer, who had left the service of Mr. Hallidie, and the company compromised after the suits against them had been pushed almost to a conclusion, so that after six years of vexatious litigation Mr. Hallidie's patents have been sustained and all the railroads in the city have acknowledged their validity. It will be noticed that although one or two inventors seem to have had an indistinct and indefinite conception of the principle of the cable system of street railway, their minds ran mostly on the elevated system as projected by Brown and Foster in 1859, or the chain running in the rail as constructed by Mr. A. E. Beach in 1864, and the only invention that had any really practical test, was that of Mr. Beach on the old Greenwich Street Elevated Railroad in New York.

Inventors may have conceived the idea of employing an endless traveling rope in an underground tube, connected at will by a gripping apparatus attached to a car on a track in the street; but we have no evidence that such is the fact or that any such idea had ever been put into practice in any part of the world, until Mr. Hallidie conceived his system and constructed the Clay Street hill railroad in this city in the year 1873. We have briefly sketched the history of the invention in connection with street railroading, where chains or ropes have been proposed to be used, and illustrated some of the earlier inventions. We now propose to illustrate the system of Mr. Hallidie as adopted by the different cable companies in this city as also the costs of construction and maintenance so far as we have been able to ascertain the same.

Although the cable railroad was invented mainly to overcome the

Difficulties in Ascending the Heavy Grades

In this city, it has been found by experience that this system is equally applicable to level roads.

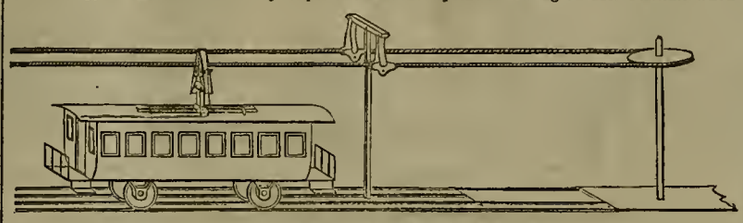

FIG. 1.—FOSTER & BROWN'S STREET RAILWAY, 1859.

As a matter of interest in connection with this invention, it may be remembered that some years ago the cars of the Omnibus Railroad company were hauled up Jackson street, from Kearny to Stockton, by extra horses, and that during the busy portion of the day, three horses, driven tandem, were placed in front of the two horses attached to the car, and that the five had all they could do to haul the cars up two blocks—the ascent being 73 ft. in 875 ft.

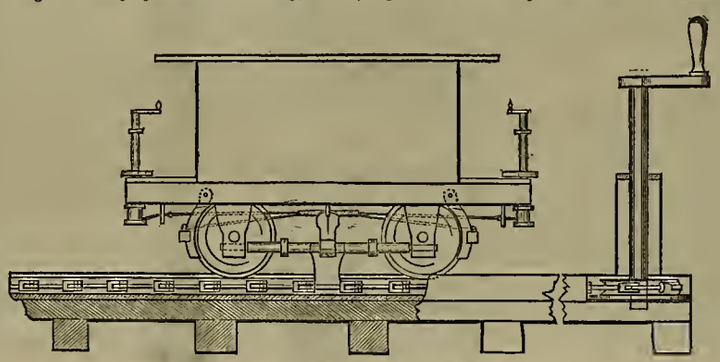

FIG 2.—A. C. BEACH'S STREET RAILWAY, 1864.

It was while watching these cars being hauled up this street, and observing the painful difficulty the horses had in performing their work (two of the horses having fallen were dragged part way down hill), that Mr. Hallidie determined to find some more humane and effective way of performing that service.

He had been engaged in devising a way of

Conveying Material Over Precipitous and Mountainous Roads

By means of endless wire ropes elevated on posts above surface obstructions, snow, etc., and had successfully put in operation a method by which this was done when the descent was as great as 1 in 1½. Those who were in San Francisco and attended the Mechanics' Fair of 1871, may remember seeing the wire tramway exhibited there by Mr. Hallidie—a full-size line, with depressions, curves and elevations, and carrying freight, passengers and children—to the delight of the latter. After perfecting this system, he devoted his attention to the solution of the problem he had in view, suggested to him by the incident above related.

At this time he was, and for two years previous had been President of the Mechanics' Institute, which, together with other public duties, required much of his time and attention, nevertheless he

Applied Himself to the Subject of Street Railroads,

And in 1871 he confidentially laid the plans he had determined on before two of his friends, well-known citizens of San Francisco. He had had California street surveyed some time previous with the intention of running an experimental line up that street from Kearny to Powell street, a distance of 1,353 ft., in which there was a rise of 193 ft., but for obvious reasons was anxious that his project should not be known as yet to the public.

Mr. Sample, of the Sacramento *Record*, who made a point of calling on Mr. Hallidie whenever he came to town, in a friendly conversation with him ascertained in part his plans, in the *Record* of July 8, 1870, in its San Francisco news, stated that Mr. Hallidie proposed to run a street railroad up California street, and had already been granted one patent thereon. Very shortly thereafter, application was made to the Board of Supervisors for a franchise to run a

Street Railroad on Russian Hill,

And one of the most extraordinary franchises ever conceived was, on Aug. 3, 1870, granted to certain parties in San Francisco, covering a small portion of every street on the slope of the hill, from Pine to Pacific, and portions of the streets running at right angles thereto. This

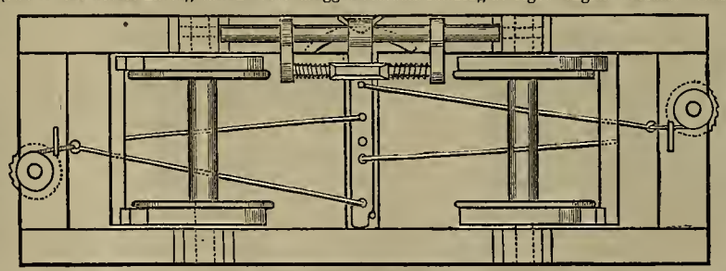

FIG. 3.—A. C. BEACH'S STREET RAILWAY, 1865.

unexpected blockade delayed the progress of Mr. Hallidie's operations, but the owners of the franchise were left to grapple with the problem of how best to get up the hill, which they finally gave up; and Mr. Hallidie had to buy the franchise before he could proceed with his experiments, and early in 1872, having the way clear, Mr. Hallidie, having previously interested Messrs. Joseph Britton and Henry L. Davis in the project, these gentlemen were joined by Mr. James Moffitt, and a company was organized to enable Mr. Hallidie to put his project into practice. The public was invited to take stock, but no stock did they take. The owners of property on the hill promised substantial aid if the scheme was carried out; but they likewise took no stock in the scheme, but preferred to make a present of a certain sum outright. Thus the four gentlemen before mentioned undertook the task of carrying into effect Mr. Hallidie's ideas—having faith in those ideas and in him, they told Mr. Hallidie to go ahead, and they would take an equal risk with him in the venture.

FIG. 4.—C. T. HARVEY'S STREET RAILWAY, 1866.

Accordingly it was determined to

Construct the Line on Clay Street,

And in June, 1873, ground was broken and the work of construction began under Mr. Hallidie's immediate supervision; and on the first day of August a trial trip was made about 4 o'clock in the morning—the terms in the franchise required the cars to be run by that day. It was a gray morning and the fogs were hanging around on the hills; the ground being slippery from the moisture. The engine was started, and the rope which was 7,000 ft. long moved through its long tube under the surface of the street quietly and satisfactorily. The dummy containing the gripper was brought to the brow of the hill looking over the bay, and the grip lowered into the tube containing the moving rope. Long ropes were attached to the frame of the dummy which was lowered a few feet over the brow of the hill, to see if it could be stopped on the steep incline in the event of the grip losing its hold on the cable. The brakes were found to be inadequate to the requirements, and the prospects of plunging down Clay-street hill improved in consequence. The hill looked very steep that morning, and there was no wagon in the street to run into, and no person visible who could be run over, and through the misty morning the foot of the hill seemed to rest in the waters of the bay. A consultation was held, and it was determined that

The Trial Had to be Made,

And the man detailed to take the dummy down the hill turned pale and succumbed to the prospect of possible disaster. Seeing the man's fear, Mr. Hallidie took charge of the dummy,

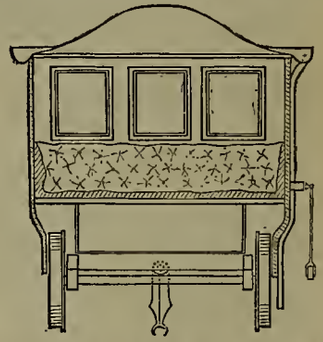

Fig. 5.—C. T. Harvey's Street Railway, 1866

and fastening the grip upon the rope in the tube, went over the brow of the hill, and with Messrs. Britton and Davis, and six of the employees, reached the bottom of the hill in safety, having tried the grip in several ways on the way down, stopping at the crossings, starting up, pushing the dummy against the direction of the moving cable, dropping the cable, picking it up again, and so forth. At the bottom of the hill the dummy was reversed and the grip again made fast to the cable, and away the car went up the steep hill. By this time some of the residents had been aroused from their sleep, and one man appearing at the window in a red night cap enthusiastically cheered and threw to the company on the dummy a bunch of flowers. At length the top of the hill was reached, and the company broke into cheers and expressed a strong confidence in the success of the invention.

The tube at this time terminated at Jones street—the time allowed having been so brief, it was found impossible to complete it to the engine house, situated at Leavenworth street, before the expiration of the time required by the franchise, and it was decided, in order to fully comply with the terms thereof, to

Make a Public Trial

In the afternoon with a car attached; and about 3 o'clock this was done. The trip down was made all right and without interruption; but the crowd was so enormous that the workmen could not do their duty, nor could the police keep the crowd back. Everybody seemed pleased at the success and were over-anxious to help; consequently, in turning the dummy it was turned with such a will that the grip was disarranged, and the workmen had to be sent into the pit, under the surface of the street, to replace some of the disturbed parts. This necessarily took some twenty minutes, and during this time the crowd increased in volume and excitement, making all kinds of remarks, but generally deploring what they believed to be the failure of the experiment, as the car and dummy did not start as soon as they expected.

It was the intention to take the car up empty and to permit three or four of the public to stand on the dummy; but the desire of the people to ride was so great that the doors were forced open and the car was crowded far beyond its capacity. In like manner people clung on the dummy, so that about 60 persons managed to get a free ride at their own risk; and when she started and moved about 20 ft., cheer after cheer rang through the air, and the surging crowd ran up Clay street, keeping pace as

well ae it could with the progress of the car.

About Half Way up the Hill

There is a sudden change of grade, and the accent increasee to 1 in 6. Here the car and dummy wavered and finally etopped on the steep hill. The people tumbled out, and determined that they should not stop there, gave the car a push and eet it moving up the hill. Meanwhile Mr. Hallidie suspected what the trouble was, jumped into a wagon which Frank Edwards had there, and running into the engine room, found that the rope, being freshly tarred, was slipping in the groove of the grip pulley, which sets the rope in motion. The application of a little lime and saw-dust and some preesure on the rope set it running again, and shortly the increasing speed of the engine told him that the public trial trip had been made, and the car and dummy were once more on top of the hill, and the thing was pronounced a success.

Like all new inventions, there were still a great many changes and alterations to be made before all the difficulties could be overcome, but Mr. Hallidie and his friends were encouraged to continue the patient and persistent efforts, which have finally resulted in making the San Francisco cable railways so celebrated, by the certainty which they then felt that complete success would ultimately crown their endeavors.

That portion of the city of San Francisco through which

Clay Street Runs is Exceedingly Hilly.

And the cable road built thereon commences at the foot of the hill, on Kearny street, at the Plaza, near the old City Hall, and follows Clay street for a distance of one mile, passing over the brow of the hill at an elevation of 307 ft. above the starting point, and distant 2,800 ft. from it. The contour of the route is shown in the accompanying drawing, Fig. 9, and it will be observed that the street is cut up by 10 cross streets, at the intersection of which the ground is nearly level, while in each side the grades vary from 1 in 28 to 1 in 6½. Clay street is only 49 ft. wide from house to house, and closely built up. This site for the experimental line was chosen because it reached the highest point of Russian hill, and presented all the difficulties which were likely to be encountered in any other street. On account of the steepness of the street, property on the hill was almost inaccessible, and numerous projects had been suggested to reach it by zigzagging up the hill by routes which would be not only very tedious and slow but very expensive.

If the city had been laid out with respect to its topography, the hillsides terraced, etc., while there probably would have been no cable road invented, the city itself would have been much more picturesque with its hills than it is now, and certainly the hill residences more accessible for carriages drawn by horse flesh.

As it is, poetry and beauty have succumbed to the practical and ugly—modified only by the fact of the existance of this new way of reaching your residences by a wire rope railway.

The simplicity, regularity and

Smoothness of the Working

Of the cable road, are as much to be admired, as the ingenuity and perseverence that overcame the many difficulties which had to be surmounted, and which we can appreciate only when we examine into the considerations and conditions connected with the first experiment, and it must be borne in mind that although inventors, as already indicated, had for many years previous given a great deal of attention to metropolitan passenger traffic, and many experiments had been tried on other systems and their methods, nowhere had this system been tried and in no portion of the civilized globe had it been reduced to practice, before being tried in the city of San Francisco, by Mr. Hallidie and his associates.

Considerations Involved.

Various considerations and conditions had to be carefully weighed before venturing upon a project which involved not only the expenditure of a large sum of money, but the comfort of the citizens and the safety of human lives.

The ordinary traffic by wagons and carriages on the street could not be interfered with, and the surface of the street was required to be left in the same condition as heretofore, with no obstructions or impediments to travel or traffic.

No posts or poles would be permitted in the streets; nor would the authorities allow any locomotive or exposed motor, that might frighten the horses or possibly explode. It was required also that the cars should be under control, so that it could be stopped and started at any point on the route as quickly as with horses. The speed, too, was limited to not less than three miles and not more than eight miles per hour, and the fare for a single passenger should not exceed five cents for the entire distance.

To meet these requirements,

Many Difficulties Presented Themselves

The street was of an uneven grade, and if a rope was employed it must be confined above as well as below, otherwise it would fly up in the air several feet above the street surface at the crossings where the road changed suddenly from a level to a rise of 1 in 6½, and if kept down, a roller or pulley had to be provided on top of the rope inside the tube, and this would be in the way of anything passing down from the car body to the rope. Another consideration was that the climate of San Francisco has long and heavy rains from October to April, and if a rope was used in a tube underground, the opening on the top of the tube should be placed sufficiently on one side of the rope, so that the grit and sand carried by the rain would not fall on the traveling rope, and any opening in the tube must be too small to permit the narrowest wheel to fall therein.

Another difficulty found was in the grooved sheeves, around which the rope would have to be wound a number of times. The unequal wearing of these grooves would strain the

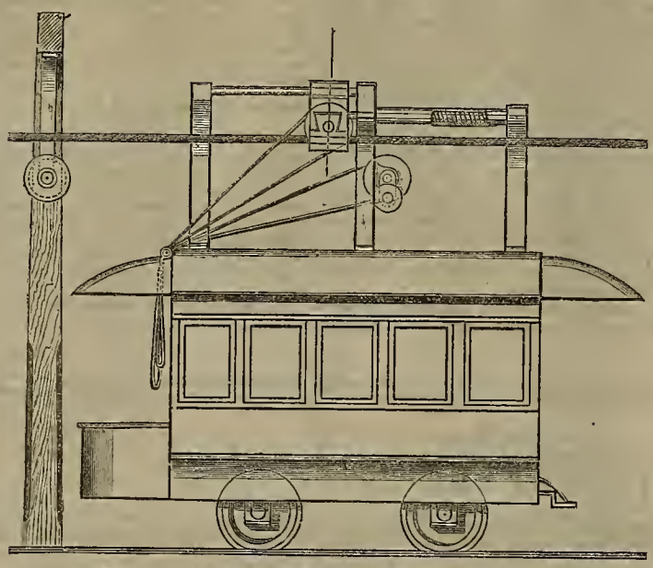

FIG. 6.—G. F. BEAUREGARD'S STREET RAILWAY, 1869.

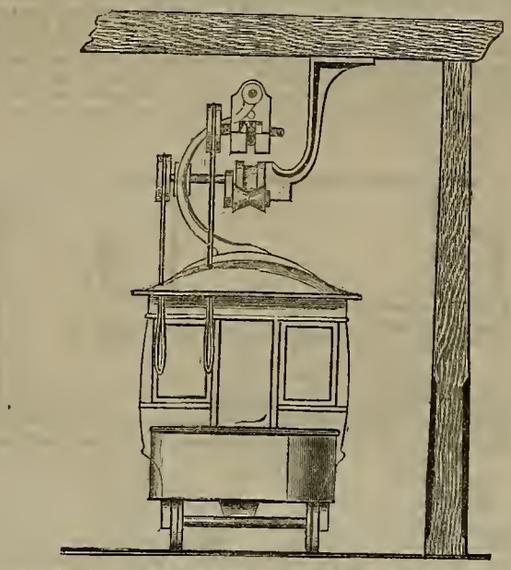

FIG. 7.—G. F. BEAUREGARD'S STREET RAILWAY, 1869.

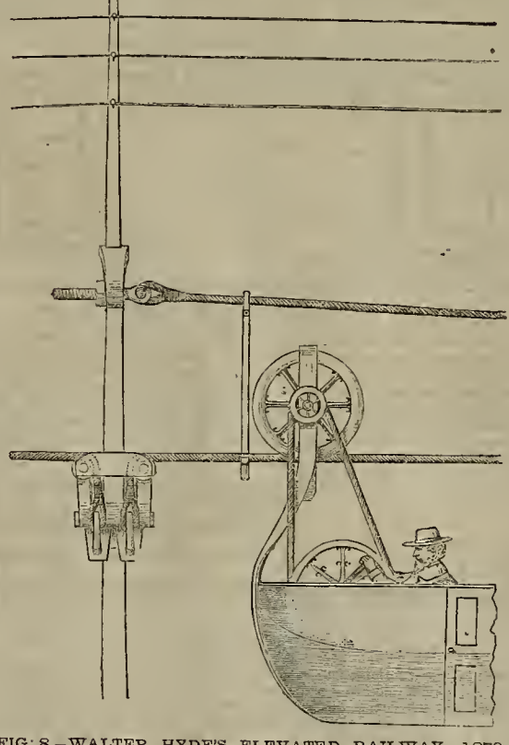

FIG. 8.—WALTER HYDE'S ELEVATED RAILWAY. 1870.

Transmission of Power

From the engine to the rope. By the ordinary way there would be required two deeply-grooved sheeves, around which the rope would have to be wound a number of times. The unequal wearing of these grooves would strain the rope and rapidly wear it by attrition. Many other minor considerations, which in the aggregate were quite considerable, have been explained to us by the inventor from time to time, as we have made our inquiries, but will not, perhaps, interest the reader, as they have all been overcome and the system brought to a high standard of perfection. The manner of overcoming these difficulties will be more readily understood from the following description of the Clay-street-hill railway, the first cable railway constructed:

The Surface of the Streets

Through which the cable road runs has the same appearance as with a horse-car line, except that between each track there is an opening running the entire length of the road, about ¾ of an inch in width. Below the surface of each track there is a channel or tube about 20 inches deep by 14 wide, and large enough to contain pulleys and rope and a gripper. The tube is opened at the top, as above stated, by the long slit ¾-inch wide.

The purpose of this tube is to protect a steel wire-rope which moves inside and the pulley which supports the rope, as well as the working parts of a gripper which connects the rope with the car on the track on the street, the shank of which passes up through the long slit before mentioned.

The Rope Inside the Tubes

Or channels runs the entire length thereof, up under one track and down under the other, and passes into the engine room. It there takes turns around a driving pulley of peculiar construction, motion being given to the driving pulley by means of a steam engine and thence imparted to the rope. At each end of the cable road, *i. e.*, at each terminus, the rope passes from one tube to another, half around a large horizontal sheeve affixed to a carriage supported on a track, and which moves accordingly as the rope becomes tight or slack, keeping an uniform and constant tension on it.

In the accompanying engraving, Fig. 10 shows the

Tube or Channel of one Track

Of a cable railroad, and it will be seen how the road is constructed, with the tube containing the wire rope and sheeve, and also, the grip in the tube and shank of the grip passing through the slot into the tube, a portion of the casing being removed for the purpose of exposing the same, the mode of connecting the ties to the yokes or standards and the stringers of the track will likewise be readily understood; in the illustration a portion of the surface of the road is removed, but the general appearance of the street will be seen by reference to the engraving and the reproduced photographic views further on.

It was necessary that the rails and the slot in the tube should be exactly parallel, hence the ties and sleepers were bolted to yoke castings which were placed four feet apart on the steep street and three feet distance where the traffic was the heaviest, and the space for the shank of the gripper in the slot being restricted (the slot seven-eighth inch wide, shank five-eighth inch thick), the track had to be carefully laid and the play between the flange of the wheels and the rails reduced to the minimum.

The Gripper

Constituted an important element in the success of the road, as also did the method by which it should be supported, and its position in relation to the passenger car. The objections to placing the gripper in the car were, that it would occupy valuable passenger-room, and it would destroy the symmetry of the car; cutting it in two, as it were. The look-out of the men in charge would be interfered with in an enclosed car, and if the car was continued beyond the termination of the cable, an unnecessary dead weight must be carried with it, unless the gripper was removed which would create delay and annoy the passengers. A carriage was contrived to carry the grip, and to be so connected with the passenger car that it could be easily uncoupled when necessary. The carriage was called a dummy, and the men in charge of the grippers became dummy-men—although only men of quick perception and intelligence were employed in this capacity. This dummy was a very different looking machine when first constructed to the present one, and for a year or two much trouble was experienced in making the dummy perform its work in a satisfactory manner. It was originally an untrained steed; jumping the track, kicking up behind and before and up to all kinds of antics, but by dint of experimenting it has been brought down to work, which it now does in a very satisfactory manner. At first it had no seats, but it is now constructed in manner shown in illustration No. 11.

Fig. 11 is a

Section Through the Dummy and the Road Bed,

And the position of the grip on the dummy and in the tube is shown. It will be observed that the slot or opening of the tube is not in the center between the rails, but is set off on one side of the rope and sheeve in the tube. There are two reasons for this. The water, dirt and sand which falls into the tube through the slot will not drop on the rope, and the grip can be so constructed as to have a heel or offset, which enables it to pass by the pulley placed in the top of the tube to keep the rope from rubbing against the crown of the tube or flying up in the air.

The grip employed on the Clay street road differs from most of the other grips in its mode of construction, although the same mechanical principles are involved. It is extremely compact and powerful, and can be entirely discon-

nected from the rope at any point on the road, and is able, also, to pick up and grip the rope at any point.

The General Arrangement of the Grip

Can be seen in the illustration, Fig. 11, and in detail in Figs. 12 and 13. It is fixed to the dummy by the slides through which the shank moves, and by the four prongs attached to the square nut through which the large screw works. The large screw is hollow, and is used for the purpose of raising and lowering the grip by means of the lower hand-wheel to its proper level, so that it will not strike anything inside the tube when in motion. The upper hand-wheel works on a screw cut on the end of a rod which passes down through the hollow screw, and is connected to a slide working in the shank of the grip so that, according to the way the upper hand-wheel is turned, the slide is raised or lowered. At the lower end of the slide is a wedge-shaped block, having the thick edge down, and two frames which slide on the heel of the shank are moved in a horizontal direction by the wedge. Attached to these sliding frames are jaws which grip the rope and small wheels which hold the rope in position and guide it between the jaws. These guide wheels have rubber springs behind them which keep them pressed forward a little in advance of the jaws, and after the sliding frames and jaws are opened by lowering the wedge by means of the upper hand-wheel, the grip is lowered over the rope by means of the lower hand-wheel working on the big screw, and the rope is seized by closing the sliding frames which brings the guide pulleys on each side of the rope, and the moving rope runs freely between the guide wheels and the jaws, but it is not in contact with the latter. By turning the lower hand-wheel, the grip is raised to its proper level so as to clear the lower pulleys and other obstructions, and when it is desired to grip the rope an extra turn is given to the upper hand-wheel, which raises the wedge still higher, bringing the jaws in contact with the rope and forcing the guide wheels back on their springs. When the grip and the dummy to which it is attached moves with the rope with the same velocity, but this momentum is acquired quite gradually, for as the guide wheels are tightened on the rope, the dummy gradually acquires the momentum of the rope until the gripping jaws securely hold the rope.

All this is performed with great ease and rapidity by the man in charge

From the Floor of the Dummy,

And the grip can be controlled easily by a boy. Another use to which the heel of the grip is put is for braking the dummy on a steep incline in case of necessity, and for which purpose it is brought up in contact with the square shoulder of a lateral timber immediately above it and which forms part of the crown of the tube. This is only used in case of emergency, as the other brakes are sufficient for all purposes. When the

Grade of the Road Changes Suddenly Upwards,

Pulleys have to be used, as before stated, to keep the rope down. These are necessarily of small diameter, and are situated as represented in Fig. 14, which is a side section of the tube, showing the upper and lower pulleys, rope-gripping attachment, and the dummy with passenger car attached.

It will be noticed that the passenger car is provided with additional brakes to the ordinary wheel brakes, and which consist of a shoe on each side of the car between the wheels, and bearing directly on the rails. These brakes are worked by a screw and are sufficiently powerful to lift the empty car easily from the track. A drag pole is also used in going up hill. Neither of these contrivances are, however, necessary on a level or comparatively level road.

The large wheel which sets the rope in motion is quite simple in its construction, but exceedingly ingenious. It consists of a series of jaws hinged together in the middle and having spurs which rest on the circumference of the wheel. When the rope presses on the jaws, they grip the rope, and as soon as the pressure of the rope is removed, they open automatically and release it. By referring to Figs. 15, 16 and 17, its mode of construction will be seen.

Obviously, one of the most important items of expense in the running of a road of this character, is the

Wear and Tear of the Steel Wire Rope

Used in hauling the cars, and one of the great drawbacks to the successful working of the system, would be the mutilation or breaking of the rope during the hours of business and the detention of travel caused thereby; hence, the most careful consideration had to be given to the life of the rope—to the immediate detection of any weakness, and to its immediate repair—consequently, all the sheaves and rope pulleys employed are of as large a diameter as possible. The rope is made to lead in a true line into the grooves thereof. As few turns as

FIG. 19—GEARY STREET CABLE ROAD—GRADE NEARLY LEVEL.

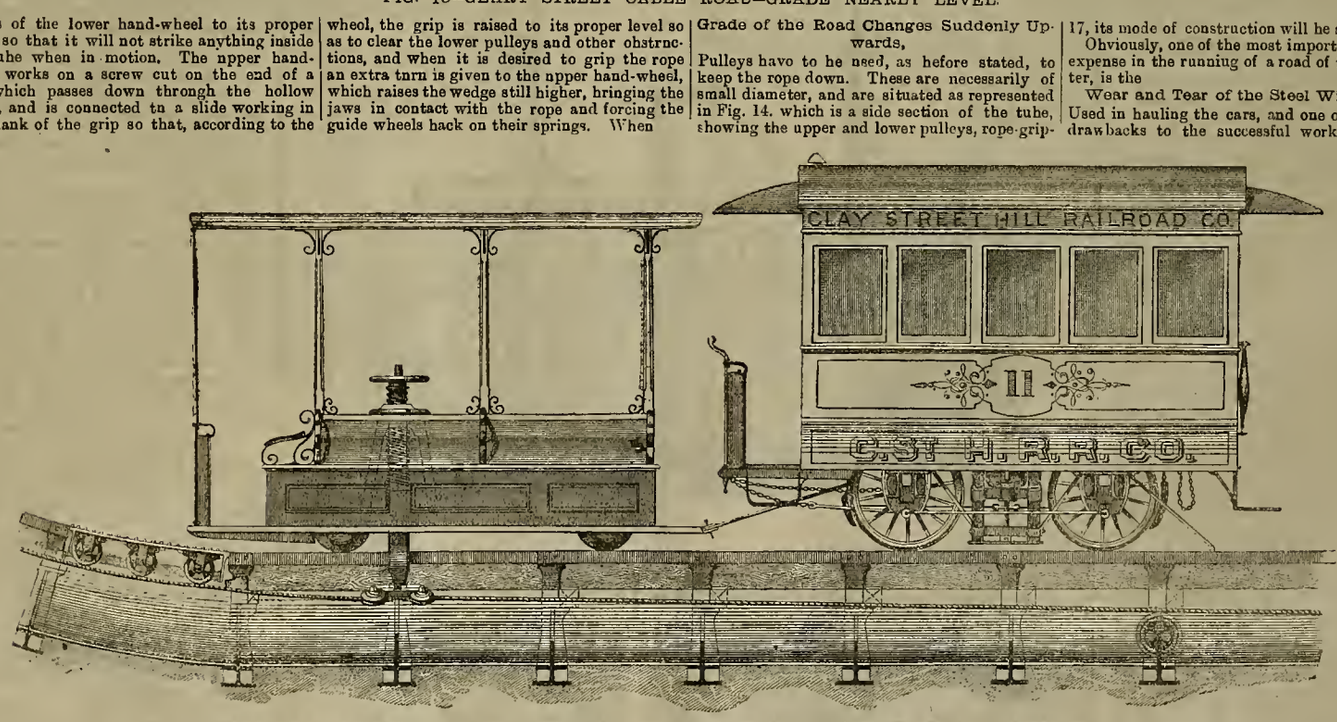

FIG. 14.—PASSENGER CAR AND DUMMY WITH GRIPPING ATTACHMENT, WIRE ROPE AND SIDE SECTION OF TUBE.

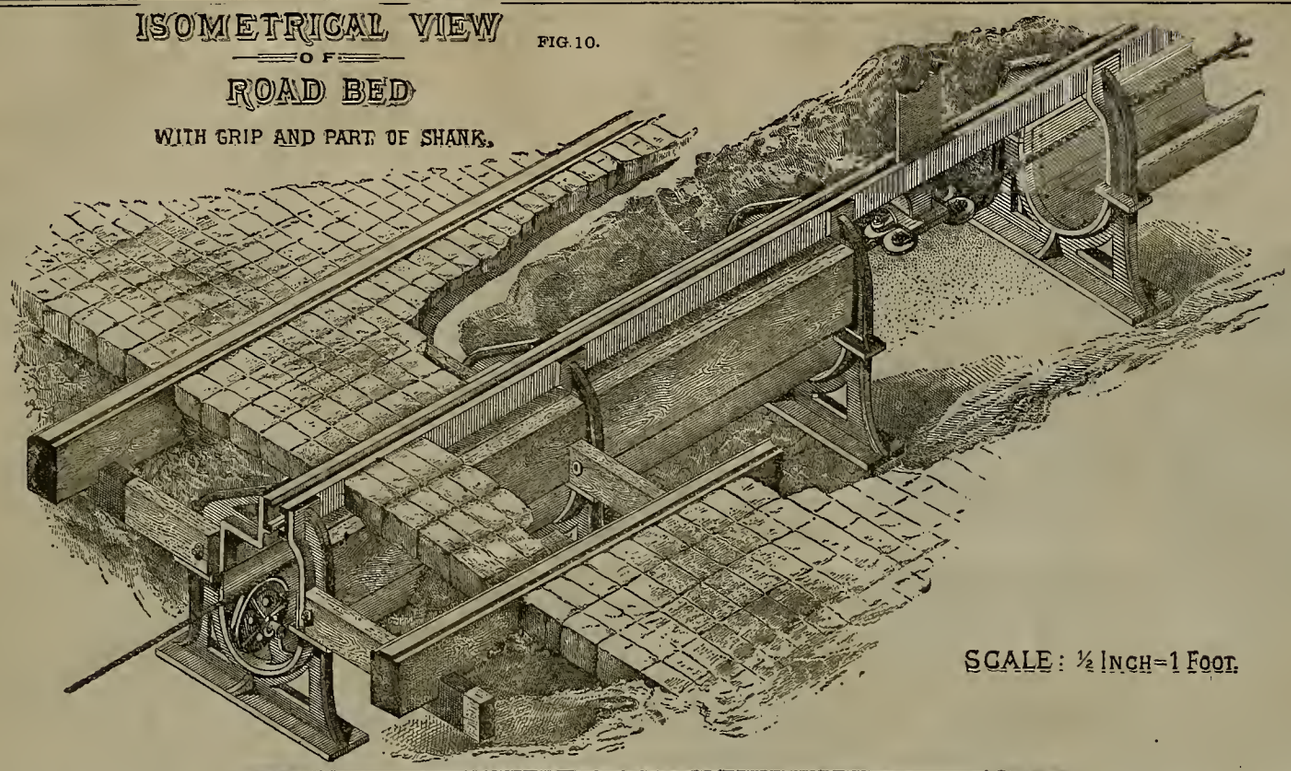
ISOMETRICAL VIEW
OF
ROAD BED
WITH GRIP AND PART OF SHANK.

FIG. 10.



SCALE: ½ INCH=1 FOOT.

possible are given to the rope. The rope is conducted in full view of the man in charge of the engine, so that he can detect anything unusual in its appearance. Tell-tales are fixed at point where the rope enters the engine-room, which automatically sounds an alarm in case a broken strand should exist. And in addition to these, an adjustable covering bar is placed over the slot which can be easily removed, and thus allow the rope to be taken up from the tube through the slot and immediately repaired at any point on the line of the road.

Engine-Room, Etc.

The engine-room, offices and car-house are located near the summit of the hill, 3,300 ft. from the eastern terminus and 307 ft. above it. The engine-room, Figs. 18 and 19, which is situated in the basement of the building, 15 ft. below the sidewalk of the street. The building itself is 68x68 ft., and is situated on the corner of the street, light and ventilation being received from the north and east sides.

Steam is supplied by two boilers 16 ft. by 54 inches, with 46 3¼-inch tubes, and the furnaces are supplied with Morton's smoke-consuming fire doors. The smoke-stack is carried up 80 ft.

There are two horizontal engines 14x28 inches, made by the Delamater company, and furnished with the Ryder cut-off. The piston speed of the engines is 532 ft. per minute, and that of the rope six miles per hour. The diameter of the driving-grip pulley is 8 ft., as also is the diameter of the angle sheaves by which the rope is lead from the engine house to the tubes in the street, the rope making a right angle to the right and left after leaving the engine house.

In the engine house there is provided a takeup arrangement for the rope, by means of which the stretching of the rope can be taken up. This is a long wrought-iron bed, 60 ft. in length, running from the grip pulley frame toward the angle sheaves, and on which is placed a rope sheave, 8 ft. in diameter, with shaft and boxes—the latter arranged to be moved back from the grip pulley whenever the rope is stretched sufficiently to require it.

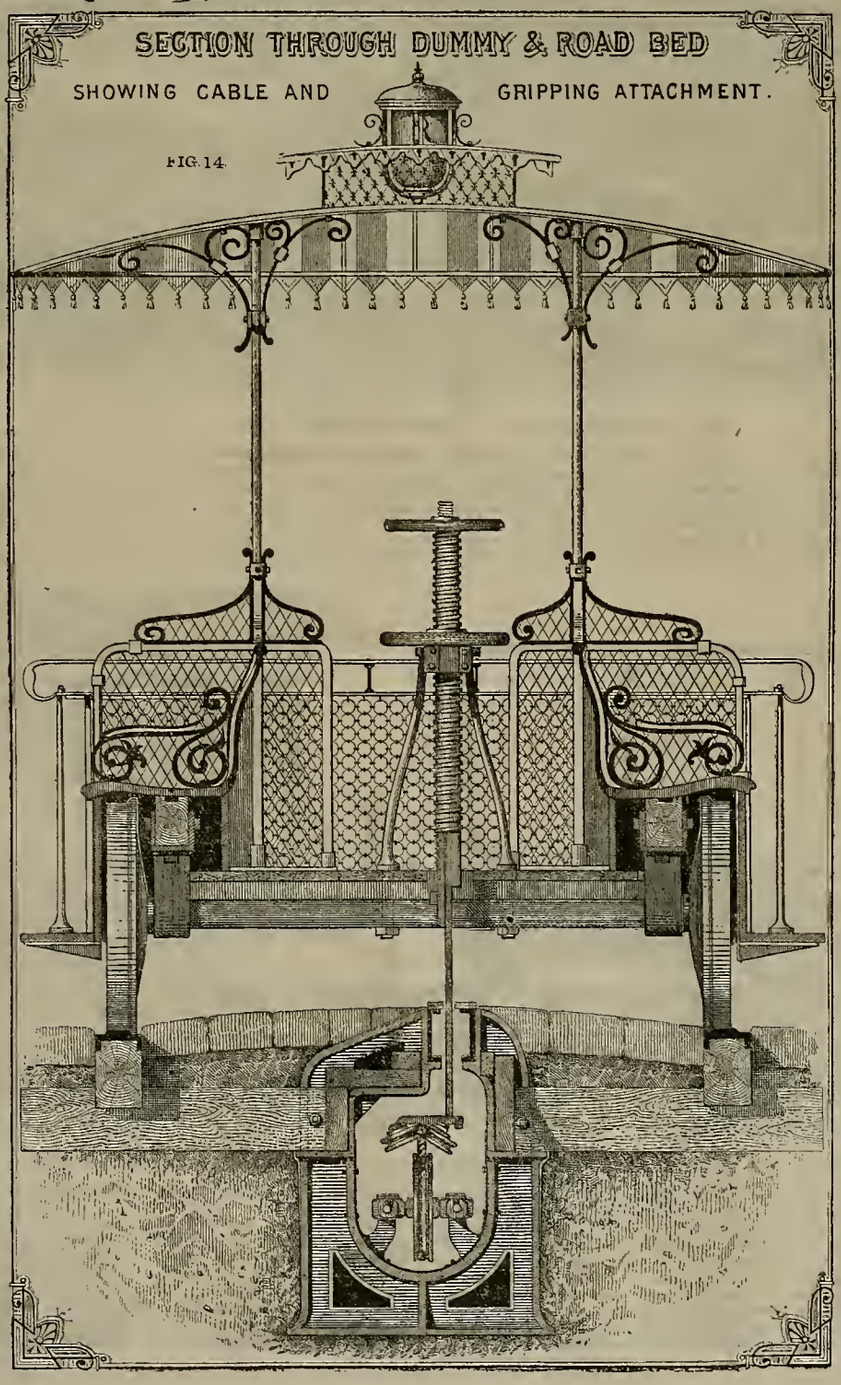
The rope, after entering the engine house, passes half around the double-grip pulley, thence half around the 8 ft.-rope-sheave of the "take-up" back to the grip pulley and half around it, thence out of the engine house over the angle sheaves down the tube. By this arrangement, if the "take-up" sheave is set back 50 ft. on the bed, 100 ft. of rope can be taken up; and as the rope used on this road is 11,000 ft. long, in one piece, it will stretch, before being too much weakened for further use, more than 1%.

The Wire Rope

Is made from crucible steel wire, and has 6 strands of 19 wires each. Each wire is .062 inch diameter, has a tensile strength of 160,000 pounds per square inch area, and capable of bending over its own part with a round turn, straightening out, and repeat at the same spot, without fracture. The average

SECTION THROUGH DUMMY & ROAD BED
SHOWING CABLE AND GRIPPING ATTACHMENT.

FIG. 14.



life of the ropes have been 20 months each.

The passenger cars seat 14 passengers, and the weight of the car is 2,800 pounds. It is provided with the ordinary brakes applied to the wheels, and has in addition thereto a brake placed between each pair of wheels, which presses vertically on the rails. This brake is 28 inches long, and is worked by a screw from the platform of the car in the usual manner, and is sufficiently powerful to lift the car when empty off the track.

The car which carries the gripper or

"Dummy,"

As it is called, is now fitted up with seats, and can accommodate 18 passengers. All equipped it weighs 2 200 lbs. It is supplied with brakes on the wheels, worked by a lever, and these are sufficient for light grades. In addition to these are additional brakes, worked by the foot acting on a wheel attached to a right and left hand screw, which actuates nuts that spread apart levers having at their feet shoes which press at an angle of 45° inward on the rail. This is a very effective and powerful brake.

The grip itself, under certain contingencies, is used as a brake, the heel being brought up against the smooth surface at the top of the tube by means of the hand-wheel acting on the large hollow screw.

The form of grip used by the California and Sutter street railroad is on the plan shown in Fig. 18. This is operated by the lever, which cause the jaws which grip the rope to open and close with a vertical motion. The mode of catching the rope is as follows: The jaws are opened to the fullest extent; and the dummy with its gripper is switched on to the rope sideways, and the jaws are closed over the rope by the movement of the lever. Until the jaws grip the rope positively, the rope runs freely over the guide pulleys attached to the frame holding the jaws.

The grip used on Clay street railroad is able to pick up the rope on any part of the road, but the grip shown in Fig. 20 can only catch the rope at points on the road that are provided with suitable sidings.

By referring to the illustrations of the Clay, Sutter, California and Geary-street roads (Nos. 19 and 20, respectively), the general appearance of the dummies and cars will be understood.

With the exception of the Presidio railroad in San Francisco, and the Roslyn tramway in Dunedin, New Zealand, all the cable roads so far constructed are straight lines.

The Presidio railway, now in course of construction, has one angle of 45°, at the intersection of Montgomery avenue and Union street, and the turn is made by deflecting the rope by means of two horizontal rope sheaves 8 ft. in diameter.

Both Union street and Montgomery avenue descend toward the curve, and before reaching the point where the rope is tangent to the curve, the moving rope is released from the grip, and the dummy and car proceed by gravitation to pick up the rope again by the grip.

The Roslyn tramway has a curve on an incline of one inch. In this case the grip cannot be released from the ascending rope. And there is a series of horizontal sheaves, placed 8 ft. apart, inside the tube, and parallel to the track the curve. This arrangement of roller and guide bar is provided to prevent the shank of the grip being bent, which might otherwise occur from the side strain of the hauling rope.

The amount of coal consumed on the Clay-

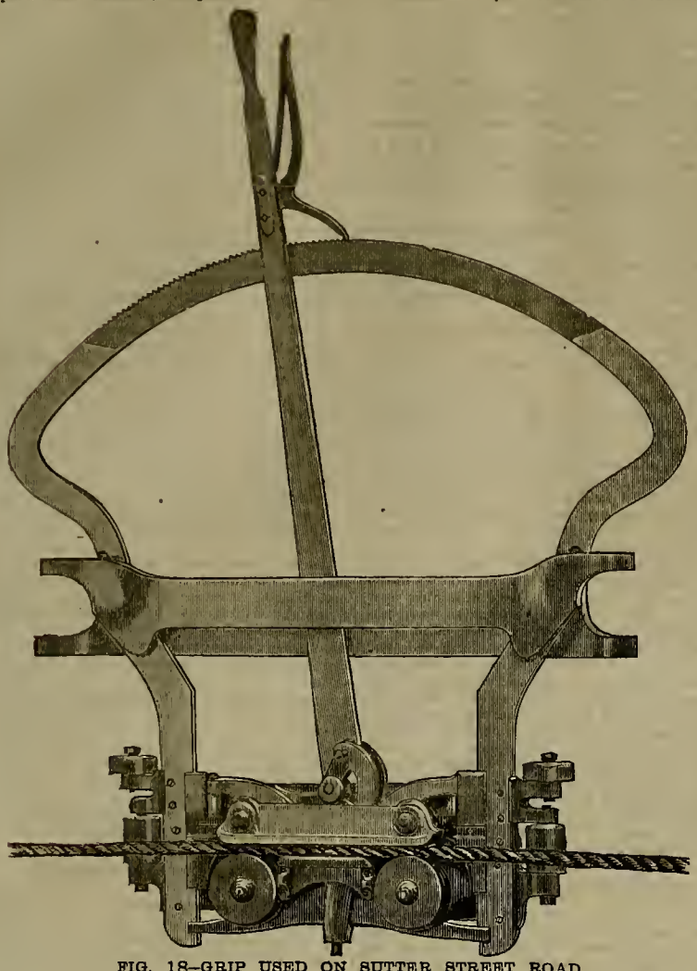


FIG. 18—GRIP USED ON SUTTER STREET ROAD.

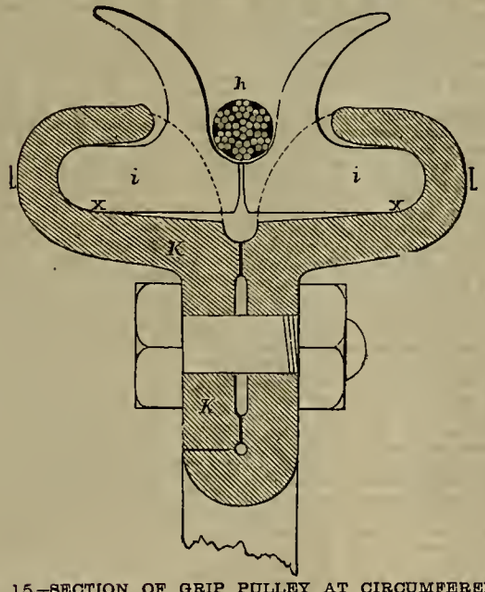

FIG. 15.—SECTION OF GRIP PULLEY AT CIRCUMFERENCE.

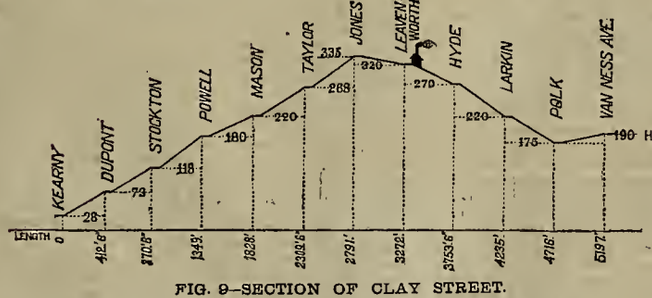

FIG. 9—SECTION OF CLAY STREET.

and slot, around which the rope passes. Immediately over these sheaves and somewhat in front of them, is a guide bar, curved exactly parallel to the slot of the tube. On the shank of the gripper there is a roller so placed that it rests against the guide bar in passing around

street railroad, Wallsend Sydney, is 3,600 lbs. per day of 17 hours, and 4,000 fares are taken daily; thus, each passenger requires 9-10 lbs. of coal to carry him on his journey, which, at $8 per ton, would be 3-10c per passenger.

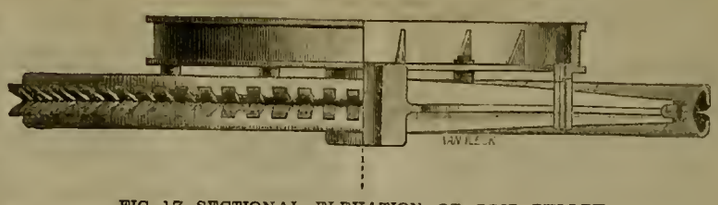

FIG. 17—SECTIONAL ELEVATION OF GRIP PULLEY.

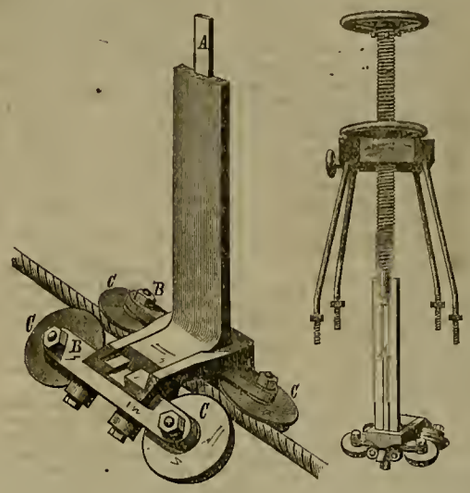

FIGS. 12 & 13.—THE CLAY STREET GRIP.

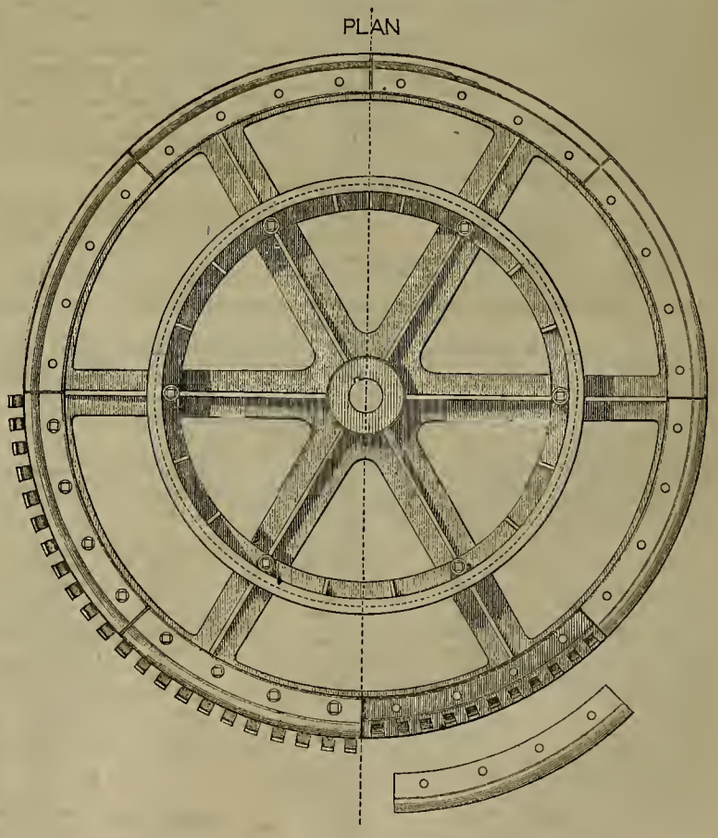

FIG. 16—GRIP PULLEY.

TABLE A.

Cost of Construction.

The following table shows the estimated

COST OF CONSTRUCTION AND EQUIPPING THREE MILES OF HALLIDIE'S CABLE RAILWAY, DOUBLE TRACK.

Excavating trenches for tubes placing and fitting tube and track, refilling and paving street	$ 6,600 00
2,700 cast iron yokes, 150 lbs. each, 405,000 lbs., @ 3c	12,150 00
264 11" dia. rope bearing sheaves and spindles, @ $2	528 00
20 man-hole castings, complete, @ $20	400 00
Sheet iron for casing tube, 111,000 lbs., @ 3½c.	3,885 00
Channel iron for slot, punched and drilled, 211,-200 lbs., @ 4½c per lb	9,504 00
Adjustable slot irons, 2×½, 71,172 lbs., @ 3½c	2,491 04
Timber, stringers, ties and housing for tubes	3,194 00
Tram rails, 40 lbs. per yard, 130 tons, @ $60	7,800 00
Fish plates, 5.984 lbs., @ 4c	239 36
Timber dogs, $171; spikes, $72	243 00
Machine bolts, 16,464 lbs., @ 0½c	1,070 10
Cost of 1 mile double track road-bed, complete	$ 48,104 56
Add 2 miles 3" flexible steel wire rops, 16,500 lbs., @ 23c	8,795 00
Total cost of one mile double track	$ 51,899 56
Cost of 3 miles double track	$51,899 50×3=$155,698 68
2 horizontal engines, 14"×30", set up	5,800 00
2 boilers, 52"×16 ft., set up	4,500 00
Tank, pump and heater	1,500 00
Compensating arrangement at end of line	1,800 00
Driving machinery, pulley, etc.	0,500 00
15 cars, @ $900	13,500 00
15 dummies, fitted with grips, @ $700	10,500 00
	44,100 00
Building site, say	$10,000 00
Buildings, say	10,000 00
	20,000 00
Engineering sundries, 10%	21,979 87
Total cost of 3 miles, complete	$241,778 55

To the foregoing must be added royalties and any extraordinary expenses of which we may not be aware.

TABLE B.

The foregoing estimate is based upon the following

PRICES PAID IN SAN FRANCISCO FOR LABOR AND MATERIAL:

Machinists	$ 3 00	per day
Bricklayers	3 00	per day
Blasters	2 50	per day
Blacksmiths	3 00	per day
Lathe and machine shop	60	per hour
Cast iron	3	per pound
Bar iron	3	per pound
Sheet iron, number 14, plain	3½	per pound
Sheet iron, galvanized	4½	per pound
Lumber, 1000 feet, B. M	18 00	
Nails, per keg, 50 pounds	4 50	
Carpenters	3 00	per day
Hod-carriers	2 00	per day
Laborers	1 50	per day
Laborers' foreman	2 50	per day
Blacksmith and forge	1 25	per hour
Bricks	10 00	per 1000
Lime	2 25	per barrel
Cement	4 00	per 300 lbs
Rails, iron	60 00	per ton
Wrought iron work, average	8	per pound
Coal	8 50	per ton

Under tables C and D are attached an estimate of the comparative running expenses of a horse railway and a cable railway working under the same headway—that is, the cars on either line leaving at the same distance of time apart—every 2½ minutes. The horse road speed being 4½ miles per hour; that of the cable road being six miles per hour; but it must be borne in mind thot the *carrying capacity on the wire rope road is double that of the horse road.*

TABLE C.

AVERAGE RUNNING EXPENSE OF A HORSE RAILWAY THREE MILES, DOUBLE TRACK, SPEED 4½ MILES PER HOUR, 32 CARS, HEADWAY 2½ MINUTES.

Stable expenses and feed for 288 horses @ $180 per annum		$51,840.00
Shoeing 288 horses @ $24 per annum		6,912.00
Maintaining harness, 288 horses @ $7.50 per set,		1,080.00
Maintaining horses, 288 @ $125 each, life 3 years, 36,000÷3		12,000.00
Maintaining 32 cars @ $180 per annum		5,760.00
Wages of drivers, 32 @ $2 25 per day, $821.25 per annum		26,280.00
Wages of conductor, 32 @ $2.50 per day, $912.50 per annum		29,200.00
Interest on cost of cars, 32, @ $900, $28,000 @ 6%		1,728 00
Interest on cost of horses, 288, @ $125, 36,000 @ 6%		2,160.00
Interest on roadbed, $32.000, @ 6%		1,920.00
Running expenses per annum, exclusive of administration of office		$138,880.00

TABLE D,

ANNUAL RUNNING EXPENSES OF CABLE RAILWAY 3 MILES, DOUBLE TRACK, SPEED 6 MILES PER HOUR, 24 CARS AND 24 DUMMIES, LEAVING EVERY 2½ MINUTES.

Coal screenings @ $0.00		$ 5,820 00
Wages of 1 engineer, $1,200, and 2 firemen, $1,200		2,400 00
Wages of dummy tenders, $2.50 per day, $912.50 per annum		21,700 00
Wages of conductors, $2.50 per day, $912.50 per annum		21,700 00
Maintaining 24 cars @ $180		4,320 00
Maintaining 24 dummies and gripe @ $200		4,800 00
Maintaining wire rope		10,000 00
Maintaining engine and running machinery, 16% on $20,000		3,000 00
Interest on cost of entire road, $241,770.55 @ 6%		14,506 71
Total		$88,246 71
Horse road	$138,880 00	
Cable road	88,246 71	
Showing a saving of		$50,633 29 per annum,

Or 36.46% on cost of running a horse railway, in addition to which must he added the increased carrying capacity of the cable road.

By examining Tables E and F, an estimate will he found of the comparative annual expense of the horse railway and cable railway having the same carrying capacity.

TABLE E.

RUNNING EXPENSES PER ANNUM OF A HORSE RAILWAY WITH 32 CARS, EACH SEATING 22 PASSENGERS, SPEED 4½ MILES PER HOUR, HEADWAY 2½ MINUTES ON 3 MILES OF DOUBLE TRACE.

Estimate of running expenses same as Table C.		$138,880 00

TABLE F.

RUNNING EXPENSES PER ANNUM OF A CABLE RAILWAY, 12 CARS AND 12 DUMMIES, SEATING 44 PASSENGERS TO CAR AND DUMMY, SPEED 6 MILES PER HOUR, HEADWAY 5 MINUTES ON 3 MILES DOUBLE TRACE.

Coal screenings, 730 tons, @ $8 00	$ 4,380 00	
Wages of engineer, 1,200, and two firemen $1,200	2,400 00	
Twelve dummy tenders @ $2.50 per day, $912.50	10,850 00	
Twelve conductors, @ $2.50 per day, $912.50	10 850 00	
Maintenance of 12 cars, @ $180.00	2,160 00	
Maintenance of 12 dummies and grips, @ $200	2,400 00	
Maintenance of wire rope, life 1½ yeas	8,533 75	
Maintenance of engines and running gear, 15% on $20 000	3,000 00	
Inst. on entire cost of road, @ 6%	14,506 71	$59,085 46
Saving by wire rope system, 57 45-100%		$79,794 54

It will be observed that the horse cars, each carrying 24 seated passengers, depart every 2½ minutes, whilst the cable car and dummy, carrying 48 seated passengers, depart every 5 minutes.

The carrying capacity of the cars and dummies on the cable railroad can be increased *ad libitum.*

In all the foregoing calculations the costs of administration and office work are considered the same, and do not enter into the calculation.

Table C places the running expense of a horse road (exclusive of administration) at $138,880 per annum or $380.50 per day, which at 5 cents per passenger would require 7,610 passengers per day to pay expenses.

If the line carried its full seating capacity and ran 18 hours per day on 2½ minutes headway it would carry daily 9,504 passengers at 5 cents, equal to $475 20.

The cable road, Table D, in the same number of hours, under same headway, would seat 19,008 passengers at 5c, $950.40, making a daily earning of $475.20 more than the horse road, or an actual gain of $171,072, which, added to the saving in the annual running expenses of (See Table D) $50,633.29, would effect a total annual saving in favor of the cable road of $221,705.29.

On page 164, we give several engravings, Figs. 21, 22, 23, 24, 25, showing sections of the lines of each of the prominent cable roads of this city.

The following Table shows the conditione under which the various Cable Roads in this City now operate.

Names of Roads	CLAY ST. HILL R. R.	SUTTER ST. R. R. CO.	CALIFORNIA ST. R. R	GEARY ST. R R
Commenced operating	September 1, 1873.	January 27, 1877.	April 9, 1878.	February 16, 1880.
Length of road, double track	5,300 feet.	On Sutter St., 13,291 ft. On Larkin St., 3,712 ft.	12,651 feet.	13,200 ft.
Heaviest grade	307 feet in 2,800.	167 ft. in 4,300	265 ft. in 2,800.	83 ft. in 1,925.
Number of engines employed	Two.	Six—4 on Larkin street, 2 on Cemetery Avenue	Two.	Two.
Dimensions of cylinders	14x28 inches.	12x24 inches.	22x36 inches.	18x48 inches.
Piston speed per minute	532 feet.	340 feet.	540 feet.	368 ft.
Number of Boilers	Two.	Six.	Three fire hox.	Three steel.
Diameter and thickness of shell	16 ft x 54 in., 5-16ths thick 16 ft x 48 in., 5-16ths "	2 each, 54x16 in., ⅜ thick 2 " 48x16 " ⅜ " 1 " 52x15 " ⅜ "	57 in. diam., 7-16th thick.	52 in. diam. 16 ft. long, ⅜ in. thick.
Number and size of tubes	42 3-inch tubes. 56 3½-inch tubes.	53 3-inch tubes 53 3-inch tubes 58 3-inch tubes 49 3-inch tubes	81 tubes, 3 in. diameter 12 ft. long.	63 tubes, 3 in. diameter, steel.
Average pressure in boilers	57½ pounds.	100 pounds.	70 pounds.	65 pounds.
Pressure necessary to move empty rope	15 pounds.	40 pounds.	15 pounds.	9 pounds.
Consumption of coal per day, and kind	3,700 lbs. Wallsend, Sydney.	24,640 lbs Seattle Nut coal	16,180 lbs. Seattle screenings.	11,230 lbs. Seattle Nut.
Weight of empty car	2,800 pounds.	3,000 pounds.	4,000 pounds.	4,000 pounds.
Weight of empty dummy	2,100 "	2,000 pounds.	3,000 pounds.	4,800 pounds.
Intervals of departure	3 to 5 minutes.	4 minutes, average.	5 minutes, average.	2½ to 6 minutes
Average number of round trips per day	221	253	226	228
Average number of cars and dummies employed	7 of each.	14 of each.	14 of each.	16, week days; 20 Sundays.
Hours run per day	17½	19½	19	19
Number of wire ropes in use	One	Four—Sutter street, 3 Larkin street, 1	Two	Two.
Lengths of ropes used	11,000 feet.	11,587 feet 7,843 " 9,800 " 8,500 "	8,840 and 17,055 ft.	15,600 and 11,000 feet.
Circumference of wire rope	3 1-15th inches.	3-inch.	4½ and 4 inches.	3-inch.
Kind of ropes used	Crucible steel, 6 strand 19 wires.	Crucible steel, 6 strands of 19 wires.	Crucible steel, 6 strands of 19 wires, Norway iron.	Crucible steel, 6 strands of 19 wires.
Speed at which ropes travel	528 ft. per minute.	431 ft. & 785 ft. per min.	537 ft. per minute.	600 and 550 ft. per minute.
Average life of ropes	547 days.	304 days.	373 days.	2:4 days.
Remarks	The engine house is located on top of the hill and about midway between the two ends.	Tbis company has two engine houses. In the one there are 4 engines, and in the other are 2.	The engine house of this company is ocated in the hollow, 4,220 ft. from Kearny street.	The engine house of this company is situated 8,900 ft. from Kearny street.

THE Merced *Express* wants a colony started in its county. To make a success of such an enterprise, it says, it only lacks "capital, and a man or company with braine and vim enough to use it."

THE Lake Superior mines, during the year 1880, produced copper amounting in value to $9,947,673.

AT latest accounts the hydraulic pump at the Combination shaft was working smoothly and successfully.

THE south branch of the Sutro tunnel is nearing the Forman shaft.

JOHN CHURCH, manager of a large mill in Tombstone district, Arizona, has entirely discarded the use of chemicals as aids to amalgamation, and returned to plain, matter-of-fact processes of gathering the precious metals by the use of quicksilver alone. He is getting better results at much less expense than by the former treatment.

THE Nevada *Transcript* says that the loss by the use of Frue concentrators in the Providence quartz mill is but 42 cents in gold and $1.14 in silver per ton.

MORE miners are being employed on the Comstock now than at any time since the collapse of the Sierra Nevada deal.

New System of Mine Drainage.

About three years ago Mr. John Patten of this city obtained a patent through the MINING AND SCIENTIFIC PRESS Patent Agency for an ingenious device for raising water and compressing air, which was also in the form of an unlimited siphon. This machine, however, was not placed on the market, for the reason that it was not deemed economical, inasmuch as it had two pipes and sections every 30 or 40 ft., which rendered the machine expensive on account of losing a large amount of power by the elasticity of the air.

The inventor being aware of these difficulties when the patent was obtained, instead of exposing for sale his original contrivance, deemed it best to overcome the difficulties and objections to his inventiou; and was so far successful that about a year ago he informed his friends that he had accomplished his object, and was ready to proceed. Accordingly, a company was organized, known as the International Water Elevating Company (No. 202 Bush street), to which was assigned the first patent together with the improvements and modifications newly developed. The invention may be briefly described as follows:

First, an unlimited siphon which consists of one plain water pipe which conducts the water from the inlet to the outlet. This pipe is connected at each end with a chamber in which a quantity of compressed air is confined which balances the column of water.

Second, a hydro-pneumatic pump, which has sometimes been incorrectly styled "an unlimited suction pump," to be used in mining operations. This consists of a common water pipe extending from the bottom of the mine to the surface. Within 20 or 30 ft. from the sump this pipe is connected with an air chamber in which there is an artificial atmosphere great enough to balance the column of water. The top of the pipe is connected with a kind of a pump on which the power used for elevating the water is exerted. The upper pump consists of two cylinders of equal capacity provided with pistons or plungers. One of these cylinders is always connected with the pipe which goes down the mine, while the other is alternately connected with the discharge pipe and the other cylinder. The pistons are attached to the engine which is to furnish the power of elevating the water.

These pistons are single-acting, and when they are receding, both cylinders are connected with the pipe that goes down in the mine, and are filled with water from it. When the engine is making the return stroke, two simple valves change the arrangement of the ports, causing the water to be forced from one of the cylindere through the discharge pipe into the atmosphere, while the full force of the engine is exerted on the water in the other cylinder, driving it back down the pipe to transmit power to the air-chamber.

The hydro-pneumatic pump, which is placed within 20 ft. of the sump, consists of a large-mouthed air chamber having a piston intervening between the air chamber and the two cylinders, the pistons or plungere of which either form a part of, or are fixed stationary to, the large piston in the air chamber. One of these cylinders is always connected by an open port with the water pipe which joins the two machines, and the other cylinder is connected with the same pipe by means of an egress valve, and with the suction pipe through the medium of an ingress valve. Its operation is as follows:

When the force of the engine is exerted on the top of the column of water, driving it downward, its pressure is exerted against the piston which is always connected with the main pipe, and forces it up; and as all three pistons are fixed rigidly together, the large piston is forced into the air chamber, and the other piston is raised, thus drawing the water from the sump through the suction pipe into the cylinder.

When the upper engine reaches the end of its stroke and commences to recede, the compressed air reacts on the piston and forces the water out of both cylinders into the water pipe, and as the capacity of the lower cylinders are equal to the capacity of the upper ones, a sufficient quantity of water is forced through the pipe at each stroke to fill the upper two cylinders. From the above it is plainly seen that at every stroke of the engine, there is a cylinder full of water received through the suction pipe at the bottom, and exhausted through the discharge pipe at the top. The water in the pipe is forced up and down, and while it is ascending, the pressure in the pipe is that produced by the weight of the water, and while descending the force of the engine is exerted on it causing double pressure. The water always ascends twice as far as it descends. At each end of the stroke the water must be stopped and started. This is easily accomplished by the operation of the ingress and egress valves at the bottom. For explanation, when the engine begins to drive the water down the pipe the lower egress valve is open so that the pressure is exerted against both plungers. While the water is acquiring its velocity, and as soon as it has attained the required velocity, the egress valve closes and the ingress valve opens allowing one cylinder to be filled from the suction pipe. In this position the engine makes the remaining portion of the stroke. When the upper engine reaches the end of its stroke, the water continues to move down the pipe for an instant, until its inertia is exhausted in forcing the piston in the air chamber and then it comes to rest. The air immediately reacts on the piston, and the ingress valve is held open until the water in the pipe attains the required velocity and then closes, and by the remaining portion of the stroke the water is forced from both cylinders into the main pipe. From the above, it is clearly seen that the force used for stopping and starting the water is equal to the force of gravity, and consequently the time required is very small. For example, if the velocity of the water be 8 ft. per second, the time required to stop or start it will be ¼ of a second; if the velocity he 16 ft., the time will be ½ of a second; if 32 ft., 1 second, and so on. There is nothing lost in stopping and starting the water, because the inertia given out by stopping it is utilized in starting it in the opposite direction. It is impossible to create any heavy strains on any portion of the machinery above the natural working pressure, on account of the bottom of the column being connected with the chamber.

Before starting the machine, the air-chamber is filled at the required pressure with compressed air, which remains confined in the chamber as an artificial atmosphere, the pressure of which is great enough to balance the column of water which is being raised. While the pump is in operation, it is continually forcing a sufficient quantity of air in the chamber to overcome the leakage, which is very small. The surplus is allowed to escape through a safety-valve, so that there is no difficulty in retaining the required pressure. A machine of this description has been built and set up at Nos. 18 and 20 Fremont street, this city, where we saw it at work this week. The pipe through which the water is raised is 60 ft. long and two inches in diameter. While working at its normal capacity, it raises 40,000 gallons per day to a hight of 60 ft. A pressure gauge attached to the lower end of the column shows that the machine is never exposed to a strain above the ordinary working pressure. The inventor claims that by reason of the extreme simplicity and positive action of this machine, it is one of the most effectual and economical devices in the market for raising water out of mines. The use of pump rods, bobs, etc., being dispensed with without putting in an extra pipe or other analogous means for the transmission of power, diminishes the wear and tear of the machinery, lessens the chances of accident and greatly reduces the first expense of the machinery.

The Harris Dry Gold Separator.

Among the various exhibits in the mining machinery department in the fair is the Harris dry gold separator, a machine, as its name indicates, intended to work auriferous earth without water. There are many places in Arizona, New Mexico and Mexico where the surface dirt is gold bearing, but where there is no water with which to work it. The old Mexican plan is very crude. It consists in winnowing or throwing the earth up and down on a raw hide in the wind, the nuggets being saved. Of course this will only do with coarse gold. Modern invention has elaborated this crude idea, however, in such a way that earth containing fine particles of gold can be utilized, and not only the nuggets but the finer gold be saved.

The Harris machine is so constructed as to have two currents of air, one to agitate the material and the other to carry off the dross while the gold is being separated. The machine has a good solid frame, bolted together with rods, and can be readily taken apart and put together. The earth is poured into a hopper, and falling from the hopper to the riffle board it passes through a current of air from a rotary fan behind the hopper. The riffle board is composed of drilling or canvass stretched over a wire screen or frame, under which is a bellows, worked by the same mechanicism as the blower. This bellows blows a pulsating, intermittent blast up through the riffle bed, agitating the earth that has fallen there, and carrying on a sort of process of concentration. The finer particles of dirt and dust are blown away by the blower before falling to the bed; but this agitation throws up some fine particles into the upper blast which carries them away. Riffles are placed at suitable distances apart on the riffle bed and behind these the gold catches.

The difficulty with most of the dry washers is a tendency of the dirt to pack. In this the finest of the dust is thrown away before reaching the riffle board, so there is, of course, no chance for that to pack. Neither water nor quicksilver are necessary to work dirt with this machine. They are made of tubular iron, with no cogs or cast iron to wear out or break. The manufacturers, James Harris & Co., 308 Mission street, informs us that their machines have been thoroughly tested in several places, and have been pronounced a success by those using them. One of them is used in Lower California, one in Butte Co. and several in Arizona. An adjustable round belt runs the machinery, so there are no gears. The capacity is said to be from 30 to 40 tons per day of ten hours, according to kind and nature of soil. They are to run by hand, though large ones are made to run with steam or horse power.

THE Coos Bay *News* says: Work on the entrance to the Coquille has been suspended, as the amount appropriated by Congress has been expended. It the necessity of more aid is properly represented to our members of Congress, another appropriation can easily be obtained.

List of Entries of the Sixteenth Industrial Exhibition of the Mechanics' Institute of San Francisco.

Explanations:

The Pavilion is divided into eight divisions, indicated by the figures 1, 2, 3, 4, 5, 6, 7 and 8 posted at the ends; also 26 sections, indicated by the alphabet, viz: A, B, C, etc., at the sides. Division 1 embraces all exhibits along the wall on the Eighth Street side. Large letters and figures are posted up, near the ceiling, in the Pavilion (on the ends and sides), corresponding to those used in this Catalogue.

The Gallery is divided into five divisions. The Art Gallery has a separate Catalogue; its rooms are known as Nos. 1, 2 and 3.

The following abbreviations will be used throughout the Catalogue:

Division;	Section;	Gallery;	Room;
div	sec	gal	rm

For instance, "div 8, sec E and F," is used in abbreviation for "Division 8, Section E and F."

The publishers can only include in this list such articles as have been duly entered in the books of the exhibition and receipted for by the Entry Clerks. Notice of any errors or omissions should be given to the Secretary of the Board of Managers that the annual report may be as complete as possible. This list has been as carefully prepared as possible by Entry Clerk, W. S. Batchelder.

14 Pursell, G. M.: 1 California Washing Machine. div 6, sec L

This was an exhibit of an improved washing machine, known as the "Californian," simple in construction, with a false bottom, iron hox springs to hold ths ruhber down, and a devics hy which tbe ruhher can be held up leaving ths tuh open and free. This machins is an improvement on the well known "Humholdt." An experimental test made on shirts, lace curtaius and delicate fahrics proved that it would wash four shirts to one hy hand, and delicate buttons sewed on the fahric in this puhlic test, remained unbroken. It has worked 100 shirts in 80 minutes, and is the perfection of washing machines.

19 Logan, M. H., M.D.: Picture of Moses. art gal

One of the striking and attractivs pictures in the Art Gallery, was a crayon painting of "Moses" hy a young lady artist, Miss Minnie Logan, of St. Helena and sister of Dr. M. H. Logan of this city. On each evening gronps of visitors gathered aronnd this picture discussing its merits and the prominent characteristics of this noted law-giver. It was copied from a medal nnearthed in Jeruselum 50 years sgo, and as far as known, no other one is in existence. On one side is the hust of Moses in bold relief, on the other the first commandment is inscribed in Hebrew characters. The medal is in bronze, in a good state of preservation and can be seen in the collection of Dr. Logan, on Geary St. This promising young artist has made a faithful copy, hringing out the characteristic features of this remarkable man. On the side of the head appears the ram's horn and helmet and on the broad hem of his garment abont the neck is worked the Hebrew characters for Moses. On the lower margin of the picture are the Hehrew characters of ths opposite of the medal, and critics who have sxamined it prononnce it a msster piecs of art and one of the very commendable exhibits of onr own artists.

36 Klinkner, C. A.: Red Rubber Stamps and Stencil Plates.

This exhibit was full and complete of all sizes and patterns of Stencil Plates, Patent Metalhodied Rubber Type of different styles, Nickle Plated Type Holder, Indelible Ink, Pads, Tweezers, Red Ruhber Stamps, Printing Wheels, Self Inking Dating Stamps, making the most perfect outfit for family printing ever produced, which can be procured of this manufacturing honse, 320 Sansome street, S. F., at a small cost. This Industry is assuming large proportions as every business house and family can become their own printers. A novelty was shown in a pocket stamp ndjusted to an ordinary pencil, which is always ready and inksd for stamping your name and address. This houss has had a large experience in thsir business, are fully equipped in thsir line and are prepared to fill orders, wholesale and retail. This industry has coms to the front as a necessity to ths office and family, and among the many houses dealing in these articles, there are nons who have a more varied stock, or sell the best goods at lower prices than the pioneer firm of C. A. Klinkoer, 320 Sansoms street, San Francisco.

37 De Long, Francis: Cider and Vinegar. div 3, sec N

This exhibit wss the succession of of a displsy which has heen made formerly by Messrs Sweetzer and De Long for ysars, and now continned by Francis De Long the successor in interest to the celebrated Novato Ranch, in Marin county, on which is an orchard of over 200 acres. From the commencement it has heen the practice to nse none hut sound, clean apples, and make pure cider and pure cider vinegar, without any foreign ingredients or doctoring. Following this practice for years, has given them and their "cider from the Novato Ranch" a State reputation, and a demand for Novato Ranch cider, which is far heyond the supply. For this year's crop, orders are registered ahead and filled only until the ripeness of the apple, proper age and racking of the cider has been completed. Those wishing pure cider, hoiled cider, pure cider vinegar from the Novato Ranch can leave their orders with the city agent, Mr. Moore, 117 Pine street, S. F.

44 Joy, E. W.: Joy's Florida Water and Perfumes, and Joy's Emulsion of Cod Liver Oil with Hypophosphites. div 3, sec O

The preparation last named above is an entirely new srticle, as made according to Mr Joy's recent discovsry. For reasons, too lengthy for description here, the preparation is mads efficacious in many cases where other preparations of cod liver oil would fail to restore. It is as yet made only in this State, and by Mr. Joy. Its use is rapidly extending, and its virtues render it worthy of hecoming generally and speedily known. Circulars can he had by addressing Edwin W. Joy, Chsmist snd Apothecary, cor. Post and Mason streets, San Francisco, Csl.

65 California Silk Manufacturing Co.: Samples Silk Thread. div 3, sec V, gal

This was an exhihit contained in one ornamental mammoth case and two smaller ones, of all kinds nf silk thread and twist, arranged in a very attractive and artistic msnnsr. This commendahle industry has heen moving forward year after year in msgnitude and extent, until now they employ 140 persons, over 100 heing young girls and women. A capitnl of hetween $100.000 and $200.000 is used in carrying this enterpriss forward; their monthly expenses bsing from $12,000 to $15.000, an increase of from $1,500 tn $2,000 over last year. The wages paid are 60c. to 90c. and $1 for unskilled lahor, and $5 to $6 for skilled labor. They mske all kinds of thread for domestic snd manufacturers' use, and of a quality superior to any thread in this market. As a home industry it should be fnstered and encouraged as our State is especially adapted for silk culture. Ths proprietors; Rodgers, Myers & Co., and the enterprising agent, Robert Y. Yates, are deserving great credit for promoting this industry to such a state of perfection and unqualified success.

130 Taylor, S. P. & Co.: 26 Packages Paper, Pioneer Mills, 181 Packages Paper, South Coast Mills. div 7, sec F

The three pyramids of paper exhihit d by this house give hut a faint idea of the amount and variety of this material manufscured and kept in stock hy it. Mr. Taylor inangurated the paper manufscturing business at the Pioneer Mills, in Marin county, iu 1856, and this is consequently the "silver" anniversary of the enterprise. He has now in his possession an *Evening Bulletin* of April 13, 1857, printed upon paper by him then manufactured, which is firm and smooth, though slightly discolored by age. Of late years he has confined his attention to the various grades of manila and straw papers. of which former kind the Pioneer Mills make 300 tons per annum, hesides fruit paper—a fine, soft rag paper, which he bas made a specialty of ever since the opening of the Central Pacific railroad Of this he has call for 80 tons this year. He is also agent for the South Pacific Coast Mills, Soquel, Santa Cruz county, which turn out 700 tons of straw paper, using in the manufacture about 1,200 tons of material. The large establishment of the firm at 416 & 418 Clay street, is stored with every conceivahle variety of these two kinds of paper, as well as paper hags, ordinary and special kinds.

204 Melsing, Miss May: Chenille Work.

205 O'Brien, P. J. & Son; 2 Open Buggies. div 1 and 2, sec N

Among the displays of local manufacturers, that of J. P. O'Brien & Sons is not second best by any means. They exhibited side bar buggies which are very firm and staunch in construction, and present new features of excellence. The reaches are in the form of a V, about an inch square, and very firmly ironed at the rear end, the apex being united by a steel receiver, which with their steel fifth wheel, socket and safety book, makes the safest, most durable and trusty connecting gearing for buggies in use. They are side spring buggies, with steel equalizing rods, having arched wooden side bars, which are really the reaches, and by their arched form equalize the spring of the gearing and jar of the cobble stones or other roughness of road. They manufacture any desired style of buggy or wagon, and also exhibit an excellent set of wheels, only varnished, to show the perfection of joint, and excellence of wood used. Factory No. 329 Golden Gate avenue. Received first premium of Mechanics' Institute in 1880, and at the State Fair, same year.

206 Hale, Loeb & Co.: Chicago Steel Horse Shoe. div 6, sec R

207 Sanborn, A. W.: Express Wagon. Thorough Brace do., 2 Delivery Wagons. div 2, sec V

208 Hellwegen, Henry; 10 Oil Paintings, 11 Portraits, Cupid and Venus in Bar-room. art gal

The display of this young artist, recently from New York, is exceedingly varied in subject, and creditable in execution. Venus and Cupid, with one or two faults eliminated, are equal to the "Awakening" or "Andromeda" of previous fairs, while his many excellent portraits and "studies," evince industry and enthusiasm in art. No. 325. "Love's Labor Lost," is a striking picture. The lover, all anxious and triumphant at prospective success, as he pleads his suit and points out the way for flight; the lass, sorrowfully despondent and hesitating in her refusal to avail herself of the opportunity. The drawing is natural and coloring in good taste. "Rich and Happy" and "The Poor Beggar Boy," Nos. 321 and 322, are emblematic and in striking contrast as to surroundings, and yet the latter seems, from his countenance, to be the most contented of the two.

209 Dundon, Patrick F.: 1 Boiler model, 1 Improved Boiler Furnace Attached to Smoker Burner on Main Engine.

210 Therien, J. H.: Patent Windmill. div 7, sec K

211 Tay, Geo. H. & Co.: Display of Boss Coffee Pots, Ranges, Etc. Own Make. div 2, sec E & F

212 Perkins, A. J.: Display of Landscapes, (Photo Cabinets). Photos Retouched in India Ink and Water Colors. art gal

This exhibit is of an exceptionally artistic character. The plain photos are well toned, sharp in outline and minute in detail. The colored work is nicely blended, and above all natural. Mr. Perkins is a genuine artist, one that not only Hayes valley, but the whole city may be proud of. His gallery is at 337 Hayes street, San Francisco.

213 Sophy & McAaron: 1 Rockaway. div 2, sec T

214 Neumann, Joseph: Display of Cocoons, Raw Silks, Manufactured Silk and Thread, Silk Flags, Silk-reeling Machine—All California Manufacture. div 4, sec J

215 Neumann, G.: Display of Preserved Fruit—All Varieties—Own Make. div 4, sec J

216 Garratt, W. T.: Display of Bells, Finished and Rough Brass Castings, Goods of Every Description, Garratt's Patent Jackhead Mining Pump, do. do. Fire Hydrant, do. Log Jack, Pump and Valves, Fire Engines, Bell and Brass Foundry. div 7 & 8, sec K. L & M

221 King, Morse & Co.: Hermetically Sealed Goods, Hand-made Cans, with Rosin. div 7, sec S

222 Huntington, F. A.: Huntington's Patent Oscillating Stamp Mill. Grinding Amalgamating Pan, Patten's Concentrator and Patten's Amalgamator. div 8, sec W

223 Linforth, Rice & Co.: Zimmerman's Fruit Driers, No. 1, 2, & 3; 2 Giant Riding Saws, 3 Blymyer's Church Bells. 28, 36 & 48 inch; 2 School Bells, 18 & 20 inch; 1 Mystic Carpet Sweeper, 1 Twin Dasher Churn, 1 10 ft. Enterprise Windmill, 1 No. 6 Rudel's Enterprise Coffee & Spice Mill, 1 Combined Wringer and Wash Bench, Enterprise Combined Sausage Stuffer, Fruit, Jelly and Lard Press, No. 25. div 7, sec I

The display of this firm, though not as extensive as some others, contains nothing but articles of real practical merit, of which we can conscientiously speak in terms of praise. Their Blymyer bells are in use all over the coast, and are unrivalled for power, durability and tone. The Enterprise Windmill, Horton & Kenedy's patent, is celebrated for its power in light wind, its wearing capacity, and its ability to withstand heavy gales. The Zimmerman fruit dryer is so cheap as to be in reach of the means of small orchardists, unexcelled for speed and the excellence of its products. Their two churns, the "Twin Dash," worked by a crank, and the "Dairy Queen" was pronounced a good butter worker by several old dairymen before they knew it was so intended, are models of beauty and experience. Their warehouse is at 323 and 325 Market street.

224 Tustin, W. I.: Ore Pulverizing Mill Designed for Wet or Dry Work. div 9, sec U

One of these machines has been in successful operation and approved by many mining men who have witnessed its workings, for the last eight months at the Ore Sampling and Pulverizing Works of Hofmann Bros., 415 Mission street, where it may daily be seen in operation. For particulars address: W. I. Tustin, inventor, patentee and manufacturer, 308 Mission street, San Francisco.

240 American Spring Bed Co.: 2 American Spring Bed Bottoms. div 3, sec J, gal

This Spring Bed claims a superiority over all others. It is durable, clean, adjustable, and for ease and comfort cannot be surpassed. It is especially adapted to hotels. Those who have tried it, never fail to recommend it to their friends. The inventor has made a useful combination in its construction. It not only dispenses with an under mattress, thereby saving labor and expense, but is also adjusted to persons of unequal weight. For further information address, American Spring Bed Co., 761 Howard street, S. F.

241 Beman, Wm.: Case of Trusses, Surgical Appliances and Artificial Limbs. rm 3, gal

This was an exhibit that attracted attention and favorable comment by the artistic display of different kind of appliances, but more especially for the Elastic Cork Truss. From numerous testimonials from leading citizens, recommendations from the California State Medical Society, in 1876–7, and the first premium at the Mechanics' fair 1880, Mr. Beman is not only known as a skillful and artistic surgical mechanic, but seems to have a mechanical genius in making appliances for the human family. The truss has no iron plates, hard springs or cumbersome pads to chafe and gall, or rust and corrode. Cork is a non-conductor, soft and elastic, and the truss can be worn sleeping, riding, dancing or swimming. Those who are afflicted can be helped and relieved by applying or sending to Wm. Beman, anatomical surgeon, Shiels' Building, 32 O'Farrell street, S. F.

[CONTINUED ON PAGE 164.]

THE O'HARRA CHLORIDIZING FURNACE.

Patented in 1878.

SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

—o—

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1.10 per ton to work 40 tons in 24 hours.

At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61¼.

Lewis Chalmers, of the Isabella G. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenical sulphurate of silver up to from 84% to 05% of the assay.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

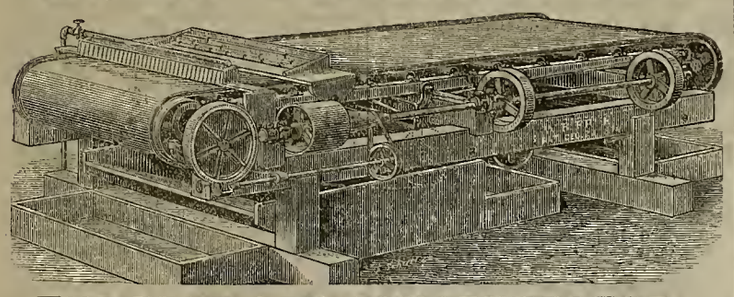
PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street - - San Francisco, Cal.

$1,000 CHALLENCE!



THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order, and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

SECURE PATENTS

Through Dewey & Co.'s **Scientific Press** Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies. Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

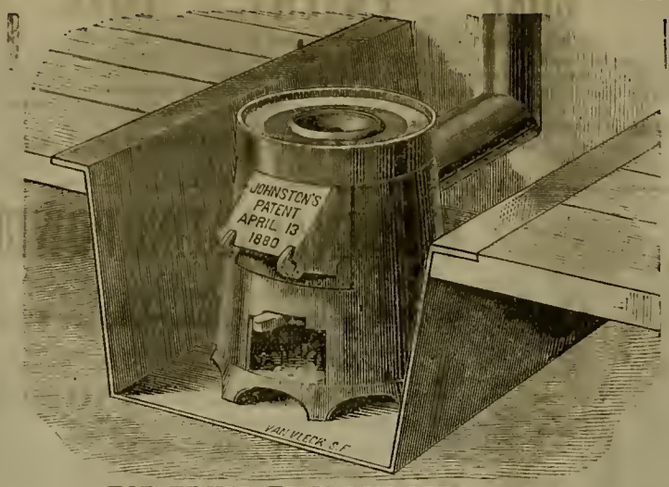
THE BEAVER WINDMILL.

The principle on which this Wind Mill is made of using weights that connect with the Wings make it self-regulating—a fast or slow motion or it will remain motionless. It is the Best, Cheapest and most Powerful Windmill ever invented. County and State Rights for Sale. One-horse power, common size, $75. Call and examine, 30th & Mission, Sts., S. F.

J. H. THERIEN,
MANUFACTURER AND PATENTEE.

JOHNSTON'S IMPROVED SOLDERING APPARATUS.



FOR FRUIT, FISH AND MEAT CANS.

This apparatus is presented to the trade with the assurance that it possesses many points of superiority over any other machine now in use. Its capacity is very great, and the quality of work is much superior to hand-soldering, and more certain in the production of tight seams. A single movement of the operator adjusts the can and applies the solder to the entire length of joint, and a like movement removes the finished work and leaves the apparatus ready for the next can. The solder is applied at one operation to the whole joint, and from the outside only, so that no acid or rosin is used on the inside of the can. In a day's work of ten hours, it will finish both ends of 3,000 fruit cans or 2,000 gallons cans. It will cap 5,000 salmon cans in the same time, and will give much better results than can be obtained in hand capping. It can be run all day with thirty-five pounds of hard coal. Address, J. J. JOHNSTON, PATENTEE, 561 Minna St., S. F. Cal.

TONITE.

Miners! Attention!

With the approach of winter, the dangers which attend the handling and use of all Giant Powders (Nitro-Glycerine mixtures) are increased.

The lives annually sacrificed in thawing or using frozen cartridges, should be a warning to all to abandon Powders which freeze at 42° Fahrenheit. All Nitro-Glycerine Powders freeze at that temperature, and now for the first time Miners on this Coast have an opportunity to AVOID THESE DANGERS.

TONITE NEVER FREEZES!

NOR IS THERE ANY LIQUID SUBSTANCE IN IT TO LEAK OUT.

It is Always Ready for Use, as well in the Coldest Regions as the Tropics.

☞Miners are cautioned to take no stock in the slanderous reports about TONITE circulated anonymously or otherwise by the Giant Powder Company. They are all untrue.

TONITE POWDER COMPANY,
218 California street, S. F.

MUSICAL BOXES.

M. J. PAILLARD & CO.,

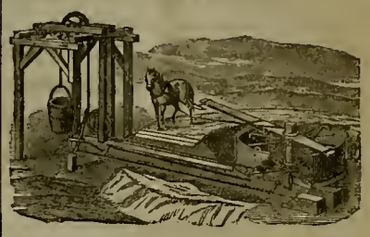
INGERSOLL ECLIPSE ROCK DRILLS.

The Most Economical Air Compressors in the Market.



MINERS' HORSE-POWER.

One Horse can easily heist over 1,000 pounds at a depth of 500 feet. The Power is mainly built of wrought iron. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

Excelsior Blasting Powder,

—MANUFACTURED BY—

THE EXCELSIOR POWDER COMPANY.

—o—

This is no NEW PATENT NON-EXPLOSIVE SAFETY POWDER, but the GENUINE STANDARD ARTICLE, and as safe to use and handle as any Nitro-Glycerine Powder manufactured. The Fumes and Gases, common in other Nitro-Glycerins Powders, are almost destroyed, and do not leave the miner with headache or nausea. Among the numerous recent testimonials the following is but a fair sample, constantly received, attesting the superiority of EXCELSIOR POWDER:

AUBURN, Cal., May 26, 1881.—EXCELSIOR POWDER CO.: I send you, per Wells, Fargo & Co., a box containing samples of country rock through which I am running our tunnel on the Conrad Mine, and through which we have now run 425 feet, 245 feet of it having been done with EXOELSIOR POWDER. If any one can produce harder rock I would like to see it. I here say that I can do more execution with your No. 2 Powder in this rock than I can with any No. 1 Powder of any manufacture I have ever used, and I have used every kind now manufactured here, excepting "Tonite," and I have had 20 years' experience in blasting. Respectfully yours,

E. W. ROBERTS, Superintendent.

Give this Powder a trial and you will use no other. For Strength and freedom from noxious fumes, it has no equal. Address all orders to EXCELSIOR POWDER CO., No. 330 Pine Street, Rooms 53 and 54, Academy Building, San Francisco, Cal.

VOLUME XLIII Number 11

The Mica Veins of North Carolina.

To those who have mica veins and there are many on this coast, the following paper read hy W. C. Kerr, State Geologist, Raleigh, N. C., hefore the American Institnte of Mining Engineers, will prove of interest. The paper is worthy of preservation as showing the mode of occnrrences of tho veins and other characteristics of those famons mica mines:

A hrief sketch only is here intended, with a few illustrations, in order to give a general notion of the character and structnre of these veins. I have stated elsewhere, several years ago, that theso veins were wronght on a large scale and for many ages hy some ancient people, most prohably the so-called Mound Builders; althongh they hnilt no monnds here, and have left no signe of any permanent habitation. They opened and worked a great many veins down to or near water-level; that is, as far as the action of atmospherio chemistry had softened the rock so that it was workahle without metal toole, of the nse of which no signs are apparent. Many of the largest and most profitahle of the mines of the present day are simply the ancient Monnd Builders' mines reopened and pushed into the hard undecomposed granite by powder and steel. Blocks of mica have often been fonnd half imhedded in the face of the vein, with the tool marks abont it, showing the exact limit of the efficiency of those prehistorio mechanical appliances.

As to the geological relations of these veins, they are found in the gneisses and schists of the Archæsn horizons, in that snhdivision which I have provisionally classed as npper laurentian, the montalban of Dr. Hnnt. These rocks are of very extensive occurrence in North Carolina, constitnting in fact the great hody of the rocks throughout the whole length of the State—some 400 miles east and west—heing partially covered np, and interrnpted here and there hy helts of later formation. Mica veins aro found here, in fact may he said to characterize this horizon everywhere, from its eastern outcrop, near the seahoard, to and qnite nnder the flanks of the Smokey mountains. It ie, however, in the great plateau of the west, hetween the Blue Ridge and the Smokey, that the mica veins reach their greatest development, and have given rise to a very new and profitahle indnstry —new and at the same time very old.

It may he stated as a very general, almost nniversal, fact, that the mica vein is a hedded vein. Its position (as to strike and dip) is dependent on and controlled hy, and qnite conformable to, that of the rocks in which it occurs, and hence, as well as on acconnt of their great size, some oheervers, accustomed to the study of veins and dikes and the characters of intrusive rocks in other regions, have heen disposed to question the vein character of these masses at first. Bnt a good exposure of a single one of them is generally snfficient to remove all douht on this score. The mica vein is simply and always a dike of *very coarse granite*. It is of any size and shape from a few inches—generally a few feet—to many rods (in some cascs several hnndred feet in thickness, and in length from a few rods to many hundred yards, extending in some cases to half a mile or more). The strike, like that of enclosing rocks, is generally northeaet, at a pretty high angle; hnt they are snhject, in these respects, to many and great local variations, all the oonditions being occasionally changed or even reversed.

An idea may he formed of the coarseness of these veins from this statement that the names of cleavahle feldspar and of qnartz (limpid, pale yellow, hrown, or more generally slightly smokey) and of mica, are often found to measnre several yards in two or three of these diminsions, and weighing several tons. I have a feldspar from one of these mines of nearly a thonsand lbs. weight, and I have known a single hlock of mica to make two full horse wagon loads, and sheets of mica are sometimes ohtained that measure three or four ft. in diameter.

There are many peculiarities about these veins. Among the most important, in a practical sense, is the arrangement of the different constitnents of the vein *inter se*. Sometimee the mica, for example, will he found hngging the hanging wall; sometimes it is found against hoth walls; again it may he distrihnted pretty eqnally throngh the whole mass of the vein; sometimes, again, it will he found collected in the middle of the vein. In other cases where the vein varies in thickness along its conrse, the mica will be found in bnnohes in the ampnllations or bellies of the vein. In still other oases where the vein has many vertical embranchments, the mica will he found accnmnlated in nests along the upper faces of these processes or offshoots. These features of structure will he best nnderstood from a few representative diagrams.

Fig. 1 is a horizontal section, with several transverse vertical sections, of a typical vein in Yancey county, at the Presnel mine. The length of the section, *i. e.*, of the portion of the vein that has been stripped, is 125 ft.; the thickness varies from 3 to 10 ft., except at a few points, as *b*, *c*, where it is nearly 20 ft.

DIAGRAM SHOWING SECTIONS OF MICA VEINS OF NORTH CAROLINA.

The crystals of mica are found in this mine generally near the foot wall, in the recesses or ponohes; at *c*, however, as seen in section *D.*, it is fonnd next the hanging wall.

The inclosing rock in this case is a hard, gray slaty to schietose gneise. The relation of the vein to the topography is seen in Fig. 2.

Another characteristic vein is well exposed at the Point Pezzle mine, in the same county, which has heen wronght very snccessfnlly for several years. (Fig. 3).

The inclosing rock is the same as in the former oase. The mica here is found mostly next the haoging wall, and also in the offshoots or branches of the vein, as shown in the vertical section at *d*. This vein illustrates the exceeding irregularities whioh are often fonnd in these intrusive masses—irregularities in form, size and position—and the force with which the enclosing rooks have heen crowded and hent and split in the effort of the vein matter to insert itself. The vein is 40 ft. thick at *b*, and 1 to 2 ft. at *c*. Fig. 4 fnrnishes another illnstration of the same points.

Another class of veins is represented hy the accompanying cross-section of one of the largest and most prodnctive veins, on which was opened the first mica mine in this region (Sink Hole), in the bottom and top, with heavy forest trees of the age of 300 to 400 years. Fig. 5.

The lower part of the diagram represents an enlarged cross-section of the vein at *b*. The wall rock, 1, 1, is a soft, decomposed micaschist. A horse, of this wall rock, is imbedded in the body of the vein on hoth sides, 1, 1. At 3, 3, occnr interpolations of smokey quartz, and next to this, on hoth sides, at 4, 4, moet of the best mica is found, thongh occasional masses of marketahle mineral are fonnd throughont the vein, at 5, and 2, 2. In the side vein, however, (*a*) the mica is fonnd mainly in the middle.

The extent and value of the mica indnstry may be indicated hy some statistics of this single mine. The vein has been worked ont to water level for nearly half a mile, and it is estimated that the aggregate length of its tnnnels is more than six miles, and the yield of marketahle mica above 40,000 lbs.

In preparing the blocke of mica, splitting and cutting to the forms and sizes demanded hy the markets, there is a waste of nine-tenths to nineteen-twentieths, even in a good mine.

The feldspar, which constitntes the larger part of the mass of these veins, is often fonnd converted into heds of the finest kaolin; and, cnrious enongh, this was one of the first and most valuahle exports to England in the early part of the 17th centnry, "packed" by the Indisns ont of the Unaka (Smokey) monntains, and sold under the name "nnakeh" (white). This kaolin, like the mica, will donhtless soon come again into demand, after lying forgotten for generations.

These are only a few of the more prominent characteristics of these very interesting veins. I have not referred to their singular richness in rare minerals, as samarskite, uraninite, gummite, allanite, etc., nor to many curions and nnexplained relations hetween the marketahle character of the mica,—size, color, pnrity, fissility, etc.,—and the special matrix in which the hlocks are imhedded. I do not know a hetter region for the study of the etructure and origin of veins in general.

About 15 miles from the Silver King mine in Calico mountain, San Bernardino connty, in the crater of an extinct volcano, an immenee hot epring has heen discovered, sufficient to fill a 6-inch pipe with water, and plans are heing made for carrying the water to the Silver King mine. This will fnrnish power for rnnning their 20-stamp mill.

A good many prospectore, says the *Territorial Enterprise*, are now sconting ont among the hills. It will he a difficnlt matter to find anything within a mile or two of this city that ie not already claimed.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

The Mining Interest in New York.

[From our Regular Correspondent.]

EDITORS PRESS:—During the past few weeks the market for mining shares in this city has been very unsettled and feverish, with prices for the stock of the mines quoted in San Francisco, of course following the fluctuations in your market, which is undoubtedly destined to remain for an indefinite period the ruling center for mining interests.

Speculation in the Comstock, Bodie and Eureka shares has been much less active than in the favorite wildcats of this market—the latter being chiefly located in Arizona, Colorado and Idaho. Last week the transactions at the two mining boards are reported as having aggregated 88,381 shares, an increase of about 200,000 shares over the business of the preceding week. The mining stock handled in the New York Stock Exchange is, as a rule, of much greater intrinsic worth and stability than that sold in the boards which are devoted to the transaction of mining sales exclusively, as the regular exchange is some what more particular in its scrutiny of the stocks proposed for listing, and besides, charges fees which rule out the weakest of the wildcats. The business of the Stock Exchange is not included in the figures given above, but it amounts to a considerable proportion of all the mining sales effected here.

Of the 88,381 shares changing hands, I do not suppose that one-fifth were of mines which appear on the lists of the San Francisco boards; and of the remainder, I fear it would be unsafe to say that they have anything like a real equivalent in value.

Mining speculation here is a much blinder, wilder, more irrational procedure than was ever the mania for stock gambling in San Francisco. And it is conducted on principles so entirely dissimilar to the ideas in vogue on the Pacific coast as to lend an air of intense ludicrousness to the whole matter. In San Francisco the whole system appears to hang upon the finding or prospective finding of ore as a means of getting up a stock "deal," and after a "deal" has occurred few of the old habitues of Pine and California streets bother themselves much about dividends. Here the situation is entirely reversed. The floating of wildcats is given an air of most intense respectability, and the buyers of the stock are invariably promised, on the good faith of the promoters, dividends in the immediate future—not profits so large and glittering as to frighten the conservative New Yorkers, but placed at a nice, enticing, good interest figure.

I do not wish to be understood as affirming that all the mining business of New York is a hoax and a swindle. Such is not at all the case. But the sad truth is that much and irreparable harm has been done to the legitimate industry by the methods prevalent here—and of these latter none is so insidious and harmful as the very practice of dinning this word "legitimate" into the ears of the innocent. Better far to have the mining exchanges operated as a reputable means of gaming (as was for so long a time the case in San Francisco) than to have them become dingy monuments of broken pledges and disappointed hopes, founded on what purported to be an honest, business-like system.

While I am on this subject, let me quote just one example of how the thing is done here. The instance came under my notice quite recently. It was this: A stock company had been formed to operate what I presume to have been anything but a good property—and the presumption rests upon the fact that if, as the promoters advertised in their very elegant and alluring prospectus, the profits were to be so speedy, so certain and so lasting, there would have been just a little too much pure benevolence in offering to divide them with the unknown public, in view of the fact (as stated) that little or no expenses were to be incurred in placing the mine upon a paying basis. For, to tell the truth, one cannot help being just a trifle suspicious of the New York "promoter" when he appears in the character of an auriferous or argentiferous philanthropist. Now, with whom do you suppose this charitable division of the proceeds was to be made? With capitalists, business men, bankers, brokers, or any men of the class? By no means. The good will of the organizers was so far supplemented by their discrimination, that they proposed to let in all the poor and needy and persons of moderate means. To this end they obtained from the lists of the commercial agencies the names and addresses of all the clergymen, lawyers, physicians and other professional men, as well as all the school teachers, boarding-house keepers, etc., of the gentler (and more credulous) sex, and to each one of this happily-selected assortment of possible stock-buyers mailed a copy of the seductive prospectus. Ought not promoters having so critical appreciation of the relative gullibility of the various classes of humanity succeed well in floating their project? I hear that they did.

There is one thing to be said in favor of the manipulators of the San Francisco stock market—whatever may be their shortcomings as considered from a fine-drawn, moral point of view, they nevertheless have never been accused of any practices to be compared with the one just quoted, or many others which men here, otherwise considered respectable and fair-dealing, stoop to when they turn their attention to placing mining properties on the market.

On the other hand, it is to be recorded with pleasure that not a few shrewd New Yorkers, more, probably, than is generally supposed, have managed to get control, recently, of profitable mines, and are reaping large returns from their investments. During the past year, a large number of fairly good mines in Arizona and Idaho have passed into the hands of men here, and, although mining, as generally conducted under "tenderfoot" management is apt to be a failure, still, enough good results have been shown to disabuse the watchers of the exchanges of the idea that all mining is necessarily disastrous, from the investors' standpoint. In fact, the enterprise of some of the heavier operators, who go in for securing mines to work for their own profit, and not merely as a basis for some scheme of gulling the public, has been such, that in certain districts they have entirely cut out San Francisco, Virginia City and Salt Lake buyers. They have reliable experts constantly traveling through the newly discovered mining districts, who, by being on the spot at the proper time, are enabled to secure promising prospects by the payment of ready cash—a much more economical method than that of bonding mines after they have been entirely developed, and in a condition to sustain themselves. This, indeed, has been the method of one of the heaviest and most successful of the California syndicates. I mean the one controlling the Standard, Ontario, Custer, Homestake and other well-known dividend mines. They have bought largely, have made many ventures, but on the whole very cheaply, and in fact seem to have acted upon the right system of mine purchase.

Dividends.

One of the local authorities states that the mining dividends paid by the gold, silver and copper mines of the United States during the last six months amounted to $6,244,250, which is $40,950 less than was paid the year previous. Since January 1st, only 40 mines have paid dividends. The States and Territories containing the mines contributing these dividends are as follows:

Location.		Location	
California	$998,000	Colorado	$962,000
Nevada	791,250	Montana	240,000
Utah	375,000	Michigan	1,410,000
Arizona	900,000	Georgia	8,000
Dakota	560,000		
Totals			$6,244,250

You will be surprised, perhaps, to learn that of the dividend payers, Michigan takes the lead with the Calumet and Hecla copper mine. California follows with the Standard gold mine. In Nevada the principal mines are the Eureka and Richmond; and in Arizona the Contention and Silver King are the chief producers.

Bullion Shipments to New York.

Another point of interest, as showing that New York has really some claim to the title of a mining center, if not *the* mining center, is that the amount of bullion sent hither for sale or for refining is on the increase. Last week the bullion receipts aggregated $258,184, and often this amount is exceeded. As a rule this bullion comes direct from the mines and reduction works, and is not re-handled bullion. And generally it is from mines owned or controlled here.

A Gradual Subsidence in Mining Operations

Has undoubtedly taken place since the lamentable breaking down of some of the Leadville favorites last year; but it by no means follows that all interest in mines has ceased. On the contrary, it appears that recently renewed attention has been brought upon the subject, and that there is a decided prospect for an increase in the near future in the volume of business, founded, it is to be hoped, upon a change for the better in the methods practiced and consequently in the results obtained. The most weighty reason for this belief is the fact that at present, and probably for some time to come, there is and will be great difficulty is securing satisfactory rates of interest upon capital advanced in the slower channels of enterprise. Very many of the heavier capitalists have been driven to accepting as low as 4% on their investments. Mortgages upon real estate, if the security is unexceptionable and the amount large, rarely bring more than 5%, and sometimes less. The stocks and bonds of the profitable railway companies, if nominally paying a high rate of interest are held at such a figure that the actual return, as calculated upon their market value, is quite low. This is also true of State securities, and even the low interest bearing paper of the National Government commands such a price that the annual returns to the bondholder are brought down to figures corresponding to those ruling in England and Germany. The result is that the incomes of many are lowered to a point very unsatisfactory in comparison with what they were only a few years since; and as a natural sequence there is now a vast amount of capital, in the aggregate, seeking more profitable application than in the ordinary local investments. Besides this consideration, it must be remembered, that during the past two years of general prosperity throughout the Eastern States fortunes have been accumulated, and these new accretions of capital have to be used in some way. Thus it is not only the people of moderate means who look toward mining investments as a means of bettering their condition, but also the more wealthy classes, who who are in a measure driven to search for something more remunerative than railway or manufacturing securities.

A Marked Increase in Discrimination

Is to be noted in the views of the New Yorkers on mining matters. They are learning, one by one, the tricks of unscrupulous manipulators, and are really acquiring a certain amount of intelligence as to the value of mining properties and modes of operating them. If the experience has been bitter, the results are salutary. In course of time there will be as many good judges of a mining proposition here as elsewhere. It is to be admitted that there is still much to be desired in this direction, and that the process of education is a slow one. However, there is no reason why New York business men, who are proverbially shrewd about other things, should not also acquire a successful insight into the mysteries of mines as well. The ultra "tenderfoot" notions are certainly becoming much modified.

During last winter and spring an unusual number of tourists from this part of the country, who had made pilgrimages to California, were attracted to the mining camps from a mixed impulse of curiosity and monetary interest. This ought to have a beneficial effect upon their preconceived ideas of mining, and has doubtless been the cause of a considerable addition to the capital actively employed in conducting the industry. PAUL WARD.

New York, August 13, 1881.

Operating and Lubricating Air Compressors.

EDITORS PRESS:—In the MINING AND SCIENTIFIC PRESS, of July 16th, I read your notice of Grigby's system of lubricating and operating air compressors, all of which I would confirm by saying, that in these mines we have formerly had much difficulty and expense in repairs, and consequently a great deal of lost time, working our compressor on the old style. Nine months ago we put Grigby's improvement on our compressor, which is a double cylinder 16-inch bore, and from that moment we haven't had any delay or the least difficulty in any way. The lubrication is perfect; the insides of the cylinders are as bright as a mirror. Not a particle of rust or corrosion anywhere. The wear is reduced to almost nothing at all. The same leathers that have been in constant use for over nine months on the valves are still perfectly good, and to all appearances will last for many months to come. The consumption of oil is less than half of what it was by the old system; consumption of water not over one-thousandth of what was required by the old system, or 1 to 1,000. The steam cylinder on the machine will furnish plenty of condensed water from the bibb cocks alone to run two such compressors. By this new device our saving per year will exceed the following figures:

On oil, one year's saving	$150
On fuel, one year's saving	550
On water, one year's saving	800
On lost time and repairs for one year	1,000
Giving us a yearly saving of	$2,500

Which, although it may seem incredible, nevertheless is under rather than over the proper amount, and this is for one compressor alone.

With the perfect lubrication which is secured by Grigsby's invention, the operation of which is positive, the wearing parts are kept smooth and in perfect order, thereby, as any mechanic well knows, making a great saving in power. The apparatus is simple and durable, no difficulty attending it, and the attendant can see at any time exactly how much lubricant is constantly entering the cylinders, and the quantity can be decreased or increased to any desired amount, and the expense is not increased in the least by so doing, as there is no loss. This improvement will do all and more than is claimed for it. I consider it worth as much to any person using a compressor, as the first cost of the compressor. The right to use it could not be purchased away from this company; we feel we could not get on without it. Any person desiring information can address R. F. Grigsby, care of Thannhauser & Co., 311 California street, San Francisco. Arrangements will soon be made to supply all parties on the Pacific coast with this valuable invention. JAMES BAIN, Chief Engineer.

Iago Mines, Sinaloa, Mexico, Aug. 12, 1881.

Glencoe District, Calaveras County.

EDITORS PRESS:—It has been some time since I have attempted to add a few lines to the columns of the MINING AND SCIENTIFIC PRESS, ever replete with sterling knowledge and mining news of interest to the Pacific States; but I will endeavor to do better hereafter.

Mining news to be useful as general information, and to the locality it emanates from, should be descriptive of visible facts simply; or at the least based on unquestionable authority. But veracity itself would be regarded with suspicion if clothed with visionary anticipations and predictions, whether feigned, sincere or caused by ignorance of the subject.

This mining district of Glencoe is situated some 10 miles northeast of Mokelumne Hill, bounded northwest by the south fork of the Mokelumne river and Amador county, by Railroad Flat district easterly, and southerly by Rich Gulch district.

The prominent country rocks are slate and soapstone, the schistose formation predominating. A narrow belt of granite, trending north and south, can be traced near the eastern boundary. The larger number of the quartz veins carry ore from 3 to 10 ft. wide—the average value of unassorted rock being low grade, but easily extracted, gold amalgamating freely in milling, with but one exception.

The Glencoe is located in the granite belt mentioned, and is probably the most remarkable mine in this county, where argentiferous ore is almost unknown. The lode crosses the South Fork at a right angle, the Woodhouse, Boston and Lone Star being located upon it to the north, and although those mines have been now and then successfully worked for many years, no argentiferous ore has ever been met with in them. The Glencoe is situate on the south side of the South Fork. Two tunnels, driven to the south on the vein, and a 10-stamp mill run by water power constitute the principal improvements. The lower tunnel shows a large quantity of low-grade ore, but has not yet reached the ore body found above. The ore in the upper tunnel is extensive, containing a large percentage of argentiferous galena. The recent product of the mine is at the rate of one-third silver and two-thirds gold. Through the kindness of Mr. J. J. Holmes, manager of the mine, I am permitted to extract from a letter written by Mr. E. C. Voorhies, superintendent of the Amador Reduction Works, who chlorinated several tons of poorly concentrated sulphurets from the Glencoe: "If your sulphurets were concentrated, as done by improved machines now in use, they would be worth from $400 to $500 per ton, and I could then obtain 97% of fire assay. The lot worked yielded 92½% of fire assay. At a low and safe estimate I think that your ore would yield $40 per ton from sulphurets, independent of the free gold. The small lot of ore (assorted) sent contains 11.68% of sulphurets and assays $467.10 per ton." Mr. Holmes is now selecting concentrating machinery, to be added to the Glencoe mill. He intends to have the concentrations worked at Sutter.

Space taken up by the above in your columns bids me to close. I will try to give you a synopsis of each prominent mine in this section if the owners or managers will facilitate the collection of facts, corroborated by the writer's eyes. S.

Glencoe, Calaveras Co., Aug. 30, 1881.

California Mining Industry.

The Chico *Chronicle* realizes the importance of the mining industry when it says: From the red hot discussion now going on in the papers that have taken up the subject of debris from the mines, one would suppose that mining had become an interest wholly antagonistic to the welfare of the State; and some even go so far as to assert that mining is comparatively of no importance to the prosperity and wealth of the community. The papers published in the mining sections, however, convey a totally different impression to the reader. In Siskiyou, Trinity, Shasta, Plumas, El Dorado, Nevada, and some portions of Butte, the accounts of the yield of the precious metals are still on the same magnificent scale as in the days of '49-50. We read in the Yreka *Journal* of a gravel claim which yields $2,000 per day, and is owned by three Americans and five Kanakas. Also, of astonishing yields from quartz crushing in all the counties mentioned. We have concluded, after reading a few of these mining county papers, that there must be a large population still engaged in this occupation and that the farmers, merchants, and transportation companies are in a great measure dependent on successful mining for their patronage. At any rate, should this spoke in the wheel of fortune be suddenly taken out, many of our people would find their business ceasing to be profitable, and would be compelled to seek their livelihood in other lands.

A New Dodge.

"Talk is cheap," but in the earlier and less palpable stages of bummerism and deadbeatism it is sometimes profitable, says the Homer *Index*. For instance, let two or three "retired miners" (retired from work) go into Bodie and lay claim to a large interest in some valuable outside mining property that is being rapidly developed by muscle and money, and let them add that the rascally company owning and developing such property owes them (the retired miners) large sums of money besides, and for which they intend commencing suit and attaching the property at once—let them attend faithfully to these details, and their summer's grub and their summer's supply of whisky is assured—and of course no one would expect them to work during the long and inclement winter. The same means of obtaining a livelihood may also be resorted to with some degree of success in Lundy, or in any other camp, so that care be taken not to attempt the game in the same camp where the accused company is operating. The co-operative plan also works admirably in this line of business—that is, by having a separate set of bummers in two different camps at once co-operating against the same property or company in a third camp.—*Bodie Free Press.*

THE Excelsior hydraulic mining company at Smartsville, are building, at a cost of from $50,000 to $75,000, a dump that it is expected will hold the tailings from their claim for two years to come.

MECHANICAL PROGRESS.

Increasing the Use of Iron.

The Belgian Commission of Inquiry into means for increasing the use of iron, which was appointed in 1877, has lately issued its report. For the better consideration of the subject it has been divided into seven classes; namely, engineering construction, buildings, mining, railway stores and fixed plant, railway rolling stock, naval construction, military material and buildings.

Almost the only suggestion which is made under the first heading, is that of substituting iron columns for stone piers in bridge-building; whilst, in place of wood, iron screw piles are recommended for pile foundations, and iron for bridge roadways, as being both stronger and cheaper than wood. Reference is made to the employment of iron in marine piers, wharves, etc. The report urges its use in buildings wherever possible, especially in all those liable to fire, in which latter case iron floors, staircases, girders, etc., should be obligatory. Doors, shutters, roofing, laths, etc., might also be constructed of this material.

For the lining of pit-shafts iron is considered by the Commission to possess advantages, as in this manner the dimensions of the shaft would be reduced. In some cases it might replace wood in the permanent galleries; and there are many other purposes for which iron might be employed in mining work, to the exclusion of wood, and the obviation of its many disadvantages.

On the question of iron vs. wooden sleepers, the report refers to the increasing preference given to the former, especially in Germany; but the Commission appears not to have had sufficient information before it to arrive at a decision. The Minister of Public Works has been requested to furnish a report on the subject.

On the question of naval construction, the opinion expressed is, that for vessels under 500 or 600 tons, wood is the cheapest material; whilst, as larger vessels are almost exclusively constructed of iron, no extension of its employment in this direction is suggested. For military purposes iron might be much more largely used than at present.

Practically, it would appear that the Commission offers scarcely any original suggestions for the employment of iron. Many of the points mentioned in the report have already been, to a great extent, successfully adopted; whilst, on the most important point touched upon—that of iron vs. wooden sleepers—the Commission discreetly refrains from expressing an opinion. Taken as a whole, it must be admitted (from the report) that its work is hardly likely to produce any practical result; but it may possibly lead to a more thorough consideration of the question, and thus attain some measure of usefulness.—*Engineering.*

USING GRINDSTONES.—A journal devoted to carpentry and building gives the following directions for using and keeping in order a grindstone used for hand tools:—Place across each end of the frame a block of wood, say 2x4 inches in size, beveled to suit the desired pitch for plain iron chisels, etc.—the beveled face to incline toward the stone. The iron to be ground is held face side down upon the beveled block with either the right or the left hand, as the case may be, the other hand turning the stone. Whenever the stone becomes glazed by turning one way, change hands and turn the stone in the opposite direction, or it may be turned backward if preferred. When the stone gets a little out of true, I change the handle one-quarter of the way around. If the stone is even grit, this will cause it to work true again. It is really a luxury for me to grind by this method, so much so that, although I have steam power which I run part of the time, I seldom employ it for grinding. It happens that I am usually otherwise occupied when power is running; hence the convenience of the method which I describe.

IMPROVEMENT IN STEAMSHIPS.—The old Cunard steamship, *Persia*, was one of the finest steamships afloat, in her days; yet she required six tons of coal to carry a ton of freight across the Atlantic in her. To-day the steamer *Arizona* is carrying freight across the Atlantic with a consumption of only one-fifth of a ton of coal to a ton of freight. It is mainly by the reduction in the quanity of coal consumed that we estimate the progress made in the improvement of steamers during the last 40 years.

NEW TINNERS' TOOL.—A Bristol, Tenn., mechanic is said to have invented a valuable machine for tinners, that will supersede the square, circular shears and dies now used, which cost $800. The new machine can be run with great rapidity by foot power, as well as by steam and the inventor thinks it can be furnished for $200. The machine is on exhibition at Bristol, and attracts much attention among machinists and mechanics.

STEEL BELTING.—A patent recently granted in Vienna and Berlin uses bands of steel, which is tempered and hardened, to transmit motion from one pulley to the other, the faces of the pulleys being turned perfectly flat and then faced with a varnish of rosin, shellac and asphalt.

Lubricants.

The desirable features of a good lubricant or unguent may be briefly stated thus: It should, first of all, reduce friction to a minimum, should be perfectly neutral, and of uniform composition. It should not become gummy or otherwise altered by exposure to the air, should stand a high temperature without lose or decomposition, and a low temperature without solidifying or depositing solid matters. The question of cost and adaptability to the requirements of light or heavy bearings are also important considerations.

The finest lubricating oils in the market—those used for watch, clock, and similar delicate mechanism—are chiefly prepared from sperm oil by digesting it in trays, with clean lead shavings, for a week or more. Solid stearate of lead is formed, and remains adhering to the metal, while the oil becomes more fluid and less liable to change or thicken on chilling.

Sperm oil is used for lubricating sewing machines and other light machinery. Some of the oils sold for this purpose contain cotton seed oil and kerosene, and others are composed largely of mineral, sperm, or signal oil—a heavy, purified distillate of petroleum.

Good heavy lubricating oil is made from heavy paraffine oil (a distillate of petroleum). Owing to the decomposition of the vapors of the heavy distillate into lighter products, which takes place in the still, the crude oil contains a large per cent of light offensive oils, too thin for lubricating purposes. These are separated by blowing superheated steam through the oils, heated just short of its boiling point in the still, the lighter oils being driven off, a neatral, nearly odorless, heavy oil remaining. When mixed with good lard oil it makes an excellent and cheap lubricant.

Common heavy shop and engine oils are commonly variable mixtures of heavy petroleum or paraffine oils, lard oil, whale or fish, palm, and sometimes cotton seed and resin oils. There are nearly as many of these composite oils in the market as there are dealers in such supplies.

The formulas of over 40 different preparations have been given, from time to time in the various technical journals which come to our table.

A New Fire-Brick.

A new manufacture has recently sprung up in England, and one which, according to *Iron*, promises well for those who have embarked in it. This is the manufacture of fire-bricks from flint, at works which have lately been started at Charlton, Kent, by the Thames Flint Fire-brick Co., of which Mr. E. R. Salway is the manager. The bricks are manufactured under Mr. Henry Edward's patent, the process of manufacture being as follows: The flint stones are first thoroughly calcined in special furnaces constructed for the purpose. The calcined flint is then transferred to a fixed pan, in which revolves a pair of heavy-edge runners. The limestone is also burned in a kiln in the usual manner and deposited in a tank, into which water is introduced, and the burnt lime is there partially dissolved. The water, in which the lime has been partially dissolved, is run into another tank, and there allowed to settle, and a proportion of the lime deposits at the bottom of the tank. The lime water is conveyed by pipes to the pan of the edge-runners in which the flint has been deposited, enough lime water being introduced to moisten the flint sufficiently for a thorough mixing. The revolving runners grind and thoroughly mix the mass, taking about a quarter of an hour for each charge of one ton of flint and lime water.

When the mass has been ground and mixed sufficiently for the purpose for which it is intended, it is removed from the pan through a sluice in the bottom. The plastic composition thus formed may be at once molded into bricks, but it is improved and brought to better temper by being kept for a few hours before molding, which plan is usually adopted. The molding, drying and baking processes are effected in the manner usual in the manufacture of the Dinas fire-brick or stone fire-bricks generally. The fire cement is brought into fit condition for sale by drying the plastic compound after it leaves the pan, and regrinding it when dry. It is then ready to be packed in bags or casks for the market. By this method of manufacture fire goods are produced which consist of nearly pure silica, and which are stated to be quite as capable of resisting intense heat as the Dinas fire-bricks, if not more so. These bricks have been tried in various steel and iron works, furnaces developing intense heat, including the Siemens' regenerative furnaces, and the results in all cases are reported to be most satisfactory.

HARD PUTTY.—The *Carriage Monthly* gives the following for a hard putty that will dry in one day: Take the whitening, mash all the lumps out on the stone, and mix into a stiff paste by adding equal parts of japan and rubbing varnish; then add as much keg-lead as you think will make it work free with the knife; then add the rest of the whitening until you have it to suit you. This will sand-paper good with one day's drying. If you want putty that will dry quicker, take dry white lead and mix with equal parts of japan and varnish, to which add a few drops of turpentine. This is very soft for putty, but can be sand-papered in from 2 to 3 hours, it becoming perfectly hard in that time.

SCIENTIFIC PROGRESS.

Measuring Mind.

A curious device has recently been invented by Dr. Mosso, of Turin, which is designed for the measurement of the force of mind as developed in the act of thinking. It is called the plethysmograph, and its revelations are based on the fact that thought creates nervous action, which consumes in its performance a certain quantity of blood, and that quantity may be measured. In an address before the American association of Paris, Prof. G. F. Baker describes the machine and its working as follows:

The forearm, for example, being the organ to be experimented on, is placed in a cylinder of water and tightly closed. A rubber tube connects the interior of the cylinder with the recording apparatus. With the electric circuit by which the stimulus was applied to produce contraction, were two keys, one of which was a dummy.

It was noticed that, after using the active key several times, producing varying current strengths, the curve sank as before on pressing down the inactive key. Since no real effect was produced, the result was caused solely by the imagination, blood passing from the body to the brain in the act.

To test further the effect of mental action, Dr. Pagliani, whose arm was in the apparatus, was requested to multiply 267 by 8, mentally, and to make a sign when he had finished. The recorded curve showed very distinctly how much more blood the brain took to perform the operation.

Hence the device is capable of measuring the relative amount of mental power required by different persons to work out the same mental problem.

Indeed, Mr. Gaskell suggests the use of the instrument in the examination room, to find out, in addition to the amount of knowledge a man possesses, how much effort it causes him to produce any particular result of brain-work.

Dr. Mosso relates that, while the apparatus was set up in his room in Turin, a classical man came in to see him. He looked very contemptuously upon it, and asked of what use it could be, saying it couldn't do anybody any good.

Dr. Mosso replied: "Well, now, I can tell you by that whether you can read Greek as readily as you can Latin."

As the classicist would not believe it, his whole arm was put into the apparatus, and he was given a Latin book to read. A very slight sinking of the reserve was the result.

The Latin book was then taken away, and a Greek book was given to him. This produced immediately a much deeper curve.

He had asserted before that it was quite as easy for him to read Greek as Latin, and that there was no difficulty in doing either. Dr. Mosso, however, was able to show him that he was laboring under a delusion.

Experiments have also been made to show that this apparatus is so sensitive as to be useful for ascertaining how much a person is dreaming—how much effort is employed in the act.

YELLOW FROM RED AND BLUE.—Lord Rayleigh described a plan for demonstrating that yellow color can be formed by combining red and blue. He mixes a red solution of chromate of potash with a blue solution of litmus, and, on filling it into a glass cell of a certain thickness, the light transmitted through it is seen to be yellow. Plates of glass coated with gelatine impregnated with chromate of potash, placed side by side with plates coated with gelatine impregnated with litmus, also transmit yellow light. Lord Rayleigh finds, however, that the eyes of different persons vary considerably in their power of appreciating the tinge of the transmitted yellow; but this has nothing to do with color-blindness, since all the persons tested could distinguish at once the components with accuracy.

PROGRESS OF CHEMICAL INDUSTRY FOR THE FIRST QUARTER OF 1881.—The number of coloring matters have been again considerably increased. Andinon and Wegnelin have prepared an improved aniline black from a mixture of aniline and one-half xylidine or cumidine. A beautiful violet color has been prepared from an ammoniacal solution of sulphate of copper and yellow prussiate. Majert's process relates to the preparation of a blue color. Salzmann and Kruger have obtained a patent for the preparation of red, violet and green colors. The woody matter of heath and of poplar trees yield, according to Savigny and Colineau, a yellow dye which they name ericine.

SCIENCE IN FLOWER CULTURE.—A gardener at Naples holds out the hope that in the near future the camellia will rival the rose in fragrance as well as in beauty. After years of experience he has succeeded in producing a camellia with a delicate perfume. It is of a pale rose color, and the gardener hopes to obtain before long fragrant white blossoms.

THE TELEPHONE UNDER WATER.—*L'Ectricite* states that M. Dohrn has introduced the telephone in connection with his scientific explorations of the bed of the Bay of Naples. By its use the diver and the boatmon overhead are able to communicate with each other quickly and intelligibly.

Is There a Luminiferous Ether?

According to the commonly received theory in regard to light and heat, all space must be filled with some subtle kind of fluid, which has been usually termed a luminiferous ether. Now, it has occurred to Mr. Albert A. Michelson, a master in the United States navy, that if such is the fact, when the earth is moving through the ether, while the latter is at rest, the time required for lights to pass from one point to another on the earth's surface would depend on the direction in which it travels. It will be greater when the light travels in a direction opposite to that of the earth, and shorter when they move in the same direction.

To prove that such is the fact, Mr. Michelson has devised an ingenious apparatus, so as to permit two pencils of light, which have traveled over paths at right angles to each other, to interfere; the pencil which has traveled in the direction of the earth's motion will in reality travel 1-100 of a wave-length faster than it would have done were the earth at rest. The other pencil, being at right angles to the motion, would not be affected.

Mr. Michelson had his apparatus constructed in Berlin, but it was found to be so sensitive to vibrations, that observations could only be carried out at night, and stamping on a pavement at a distance of 30 ft. from the Potsdam observatory caused the pencils to disappear entirely from the field of vision of the telescope.

Mr. M. has, however, made a series of experiments, and comes to the conclusion that the hypothesis of a stationary ether is incorrect. The conclusion directly contradicts the explanation of the phenomenon of aberration which has hitherto been generally accepted, and which presupposes that the earth moves through the ether, the latter remaining at rest.

THE SPEED OF THOUGHT AND THE SENSES.—Some interesting experiments have recently been undertaken by European scientists, to demonstrate the speed of thought along the various nerves of the human body, and also the speed of the several senses. Helmholz has shown that a wave of thought would require about a minute to traverse a mile of nerve, and Hirsh found that a touch on the face was recognized by the brain, and responded to by a manual signal in the seventh of a second. He also found that the speed of sense differed for different organs, the sense of hearing being responded to in a sixth of a second, while that of sight only required one-fifth of a second to be felt and signalled. In all these cases the distance traversed was about the same, so the inference is, that images travel more slowly than sounds or touch. It still remained, however, to show the portion of this interval taken up by the action of the brain. Prof. Donders, by very delicate apparatus, has demonstrated this to be about .7500 of a second. Of the whole interval, .4000 are occupied in the simple act of recognition, and .3500 for the act of willing a response. When two irritants were caused to operate on the same sense, 1-25 of a second was required for the person to recognize which was the first, but a slightly longer interval was required to determine the priority in the case of the other senses. These results were obtained from a middle-aged man; but in youths the mental operations are somewhat quicker than in the adult. The average of many experiments proved that a simple thought occupies 1-40 of a second.

TWINKLING OF THE STARS.—Recently M. Montigny has written again on the increase of the twinkling of stars when there is a display of the aurora borealis. The increased scintillation is seen all the more clearly on winter than on summer nights, and the phenomenon is more apparent when stars in the northern region are observed. The author thinks the effect is not due to the direct influence of the electro-magnetic light of the aurora on the scintillation itself, but to disturbances (probably a cooling) which coincide in time with the appearance of the aurora in the upper regions of the air traversed by the star rays.

EFFECTS OF INTELLECTUAL WORK ON THE BRAIN.—What are the effects of different kinds of intellectual work on the cerebral circulation? This question M. Gley, a French physiologist, has attempted to answer by experiments made upon himself. When he applied himself to a subject which he had a difficulty in understanding thoroughly, and had, therefore, to concentrate all his energies upon it, the rhythm of the heart was far more accelerated than when he took up some matter with which he was well acquainted.

REPORTED LITERARY DISCOVERY.—An important and hitherto unknown treatise by Copernicus, on the movements of the celestial bodies, has been discovered in the archives of the astronomical observatory at Stockholm. This treatise is said to fill a very valuable place among the writings of the great astronomer. There is no doubt as to its genuineness, as it is soon to be published and given to the world.

DIGESTION.—R. P. Chittenden is inclined to the belief that in the stomach there are two stages of digestion, separate one from the other—a first, in which the action of the saliva can go on without hindrance, and a second, in which pepsin alone is active,

The Mining Share Market.

There is notbing very new to report about mining stocks. They bave not been very lively. Up on tbe Comstock nothing startling has happened.

Work will be resumed in the Savage next week at several points under very favorable circumstances. Henceforward the work of exploration in the mine will proceed uninterruptedly.

Excellent progress is making in all the preparatory work in the honanza mines, and soon they will be in a position to begin active explorations on several levels.

The hydranlic pump still continues to work satisfactorily, taking all the water sent to it, and there is now nothing to prevent the thorough opening (hy crosscuts) of the 2400-level of the middle mines. The Chollar and Potosi folks will doubtless start crosscuts as soon as they have completed the snh-drain in their main drift.

The following statements show the financial condition of some of the big companies ou the 1st inst:

Bullion — Receipts, $61,812.36; disbursements, $49,412.65; cash on hand, $12,399.71; due Ward Company, $102,866.66; due Sutro tunnel, $3,295.96.

Best & Belcher—Receipts, $45,301.41; disbnrsements, $24,971.61; cash on hand, $20,-329.80.

Consolidated Virginia—Receipts, $3,257.65; disbursements, $18,194.61; indebtedness, $92,-086.80.

California—Receipts, $118,173.86; disbnrsements, $21,276.55; cash on hand and in bank, $1,511.37; hullion on hand, $1,111.27.

Gould & Curry—Receipts, $50,868.68; disbursements, $22,852.29; cash on hand, $29,-938.99.

Hale & Norcross—Receipts, $55,312.25; disbursements, $40,686.59; cash in bank, $14,-266.28; cash in office, $359.39; amount due on assessment No. 70, $3,789.10.

Occidental—Receipts, $8,222,92; disbursements, $103; cash on hand, $8,119.92.

Savage—Recipts, none; disbursements, $12,-959.85; indebtedness, $11,200.

Utah—Receipts, $29,019.75; disbursements, $10,799.50; cash on hand, $14,186.89.

BORING for oil has begun at Sargent's tar springs, near Gilroy.

The San Francisco Sub-Treasury.

The transfer of the office of the United States Sub-Treasurer in this city was made at the close of bnsiness, Angnst 31, 1881, from Wm. Sherman to Nathan W. Spaulding, be receipting for the entire assets thereof, according to tbe balances shown hy the books of the office in its several accounts, in the total sum of $45,575,-997.93. The count was conducted by Mr. Sherman, Mr. Spaulding being represented by J. W. Dodge, when not present. The numher of counters employed was 16, besides superintendents and laborers, daily for two months, and all worked six honrs. The counting of the silver fractional coin was equivalent to the amonnt of $8,000,000 in half-dollars, or 16,000,000 pieces. The money was put np in bags of $1,000 each, and these bags occasionally overrun or fell short 50 cents; but the connt of this immense sum of over 18,000,000 pieces did not vary from its record in amount a sum exceeding $5. The whole amount of counterfeit embraced in the whole sum of over $19,200,000 silver, including all variance in connt was $63, and the final footing of all the money showed a deficiency of one cent.

Mr. Spaulding has made no changes in the clerical force of the office, and will not until he becomes more familiar with the duties and capabilities of the man performing them. It may not be inappropriate from a long personal acquaintance with the new Treasurer, for us to congratulate the public on the accession to office of so good a business man, and one so likely to make a good Treasurer. Mr. Spaulding has been Mayor of Oakland, and is high in rank in the Masonic fraternity. He has established in our midst one of our most flourishing home industries—the Pacific Saw Co.—and is the inventor of the famous removable tooth for saws, which hears his name. He has been for many years in business among us, and has won not only an enviable reputation for business integrity, but for urbanity and high character from a social point of view. It is pleasant to see a man of this type placed in one of those pnblic positions which is too apt to fall to the lot of a mere politician.

THE California Southern railroad track is now laid seven miles north of the San Diego wharf. Work is proceeding at the rate of a mile a day.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

BUNKER HILL.—Amador *Dispatch*, Sept. 3: The Bunker Hill mine, near Drytown, is in a prosperous condition, and everything around it wears a lively and business-like aspect. The mine is down about 500 ft, where the ledge is about 18 ft wide, and apparently of good paying quality. The 40-stamp mill is kept constantly pounding away.

THE KEYSTONE, of Amador City, still retains its position as probably the best and most constantly paying mine in the county, and there is no danger of its losing that distinction for several years to come.

THE EMPIRE, at Plymouth, is baving its north shaft retimbered, which is now near completion, and when finished new hoisting works, the timbers for which are already framed, will be erected over it. Only 70 of the 80 stamps are running at present, which, owing to the scarcity of water, are being run mostly by steam power.

THE PACIFIC, which joins the Empire on the south, and which has been somewhat prospected about 1,000 ft below the surface through the Empire shaft, is now at work erecting a large mill which will probably be completed within the next two months. Its motive power will be supplied by water brought from the Amador canal, through the new ditch which was recently dug from the main canal to Plymouth.

ROBERT STEWART'S little 5-stamp mill near the West Point bridge on the Mokelumne river, is kept busy crushing the rock from his claim, which is taken from three tunnels, which are so situated as to place them in the position of three distinct levels on the same incline ledge—the stoping being done from, and on a line with the main tunnels. He is crushing about 7 tons of ore per day.

SOME remarkably rich rock is being taken from the Modoc mine above Volcano, and crushed at the Pioneer mill. It is estimated that the rock will average $40 or $50 per ton, which is extracted by tunneling into the mountain instead of by sinking a shaft. The ledge is about 4 ft wide, and the ore easily extracted

BUTTE.

NOTES.—Orovllle *Mercury*, Sept. 2: The main tunnel of Treasure Box mine is in 750 ft, and progress is being made at the rate of 10 ft a day. Wednesday noon the men struck good paying gravel. No attempt, however, will be made to wash it. The Miocene patent arrived from Washington a short time ago, and Major McLaughlin notifies the parties who own the ground that is covered by the patent that he stands ready to make out the deeds of conveyance to them, if they will call at the office inside of 30 days. Wednesday night, Reed & Bird started their water wheel at the wing-dam, but twisted off the end of the main shaft. The argument in the Miocene case took place before the U. S. District Court, Monday, and occupied the entire day. At the close of the argument both parties were given 10 days in which to file briefs. Judge Sawyor will probably render a decision soon after the briefs are filed. The mining men are quite jubilant over the able efforts of their attorneys, Sam. Wilson and Judge Wallace.

CALAVERAS.

MILL STARTED —Calaveras *Chronicle*, Sept. 3: The gravel mill which has been in course of construction on the Corral Flat mine is now completed and was run a few hours during last week on trial. Everything proved to be in perfect order and to run smoothly. We have yet to see a mill, the erection of which was directed by J. bu Steele, that wouldn't work right from the word go. As soon as "breasting" in the mine is commenced the mill will be kept constantly running. Some gravel which was crushed while trying the mill showed splendid prospects.

EXTENDING DITCH.—Those successful and enterprising miners, Messrs. Cook Bros., owners of the famous Eureka hydraulic claim on the Calaveras river, are now busily engaged in extending one of their ditches which supplies the claim with water. It is the intention to take the water from the North Fork of the Calaveras river, better known as Esperanza creek. This will necessitate the digging of seven miles of ditch, which is now being undertaken and pushed forward with the vigor which has characterized all the operations of the owners of this property. There are at present over 60 men at work and it is the intention to have the work completed before the rains. It is an expensive undertaking, but when finished it will add greatly to the value of the whole property

RASPBERRY.—*Mountain Echo*, Sept. 3: We were shown several specimens of ore taken from the Raspberry mine, one day last week, by Bennett & Co., which is decidedly rich. The shaft from which these specimens were taken is about 20 ft deep, and the vein or lode is about 5½ ft in width, and still grows wider as the shaft is sunk deeper. Some of the ore contains a vast amount of sulphurets, in which considerable gold may be seen.

EL DORADO.

A RICH "POCKET."—*Mountain Democrat*, Sept. 3: An old gentleman named Gregor or Gregory struck a "pocket" of decomposed quartz, in a ledge near the Mormon Tavern, below Clarksville, last week, from which in a few hours he took out about $800.

RICH GRAVEL.—At the Lyon mine, Prospect Flat, they are working a large body of extremely rich gravel with highly remunerative results. Good gravel, and a considerable body of it, has also been struck by the same company in their Cedar Ravine mine, formerly known as the Dickerhoff & Goyan claim. The supervision of both these properties keeps Capt. Huchinson, the Supt., quite busy.

EUREKA.—Georgetown *Gazette*, Sept. 2: Work at extracting ore in the Eureka has been temporarily suspended, but the pump is kept running. The work of prospecting the mine has been carried to a satisfactory point. The body of ore is immense, ranging from 20 to 30 ft in width. It is, however, of low grade. Between 50 and 60 tons of this quartz has been thoroughly tested, and enough is learned to know that the Eureka will pay if the proper reduction works are put up. This is now the matter for consideration by the company in New York during the next two or three weeks. From the best we can learn, the rock averages about $4 in free gold per ton, and the sulphurets, $80 per ton, it requiring about 12 tons of ore to produce one of sulphurets. Occasionally high grade ore is met with, and the mortar tests from this has naturally caused extravagant estimates to be made by some. The shutting down of work on this mine has caused a feeling of distrust among many of our people, but we entertain no such opinion, as we are satisfied that a mill will be erected on the mine this fall. Another thing, it would not be an act of economy to continue hoisting rock with no ore bins or beds prepared for its reception, and further this cannot be done until the plan of the reduction works has been matured.

THERE are at present two gentlemen stopping in town, engaged in the business of bonding and buying mines. We learn of three mines in this vicinity which have recently been bonded, but not learning that any cash had been put up, we are inclined to the opinion that a dividend is not likely to be declared for some time.

WORK has been resumed on the Martha Ann quartz mine, about 5 miles north of town, owned by E. C. Check. Robt. Cushman, Sr., and Frank Check went up Tuesday. They are now drifting on a 6-ft ledge which prospects very fair. The ledge was reached last spring by running a tunnel into the hill some 90 ft.

INYO.

BEVERIDGE DISTRICT.—Inyo *Independent*, Aug. 27: The Keynot mine continues to produce astonishingly rich gold ore. Taylor & McEvoy's 5-stamp mill made a partial clean-up during the past week, after an 8-day run, and obtained $10,000 in gold bullion as a result. The Keynot is proving to be a first-class mine, it having already produced about $75,000, with a comparatively small extent of

development. Other claims in Beveridge are being prospected, which are said to be showing up as good as the Keynot. Considerable ore has been taken out, but there being only 5 stamps running in the district, the quartz cannot be crushed until another mill is erected.

MARIPOSA.

STRUCK IT BETTER THAN EVER.—Mariposa *Gazette*, Sept. 3: Messrs. Harvey & M'Cook, who for some time past have been working a vein, or strata, of decomposed quartz, located in the barley field near the road leading to Colorado, have recently struck the main vein, lying parallel and within a few inches of the strata they had been working upon. At the depth of 40 ft the strata had pinched out, and the owners despaired of finding anything to justify their working further in the same locality. After spending several days prospecting around for other diggings, Mr. Harvey bethought himself to stick a pick into what was supposed to be the foot-wall of the strata which they had followed down as before mentioned, and had penetrated but a few inches before passing into a well defined vein of excellent ore about 2 ft thick. Messrs. Harvey & M'Cook are industrious and practical miners, and their prospects of ample reward for past labors are very encouraging.

NEVADA.

CONTRACT LET.—Nevada *Transcript*, Sept. 1: The Gen. Grant mining company, whose claims is situated on the ridge, near the Town Talk house, has let a contract to run another 100 ft of tunnel to Joseph Fouyer. The tunnel is in already 425 ft. The company expect to strike the pay channel or ancient river bed, which is known to run through the ridge, in about 200 ft farther.

PATING OSK.—The old Marshal orchard, at the south end of Auburn street, Grass Valley, owned by Messrs. Lowery & Young, is being developed into quite a quartz mine. Twenty-six tributers are at work on the property, the ore paying from $50 to $150 a load. It is estimated that the ground has produced about $25,000 during the year and a half that prospecting operations have been going on. Arrangements are now being made to work it systematically.

SQUAW CREEK.—*Idaho World*, Aug. 20: Five locations have been made on the Liberty, on Squaw creek. The ores of this vein contain copper enough to pay the expenses of shipping to Salt Lake, and also for reduction. We understand that John D. Gray, of Boise, will erect a smelter there if development shows a vein of sufficient extent and richness to justify it.

FAYETTE.—H. C. Thompson and N. Carpenter are working their hydraulic claims on Payette, and are doing well. Thompson's diggings are 6 miles above where the road strikes Garden valley, and Carpenter's 4 miles above. Carpenter's son, about 14 years old, and his daughter, aged 11, are carrying on mining operations on the side, by means of a sluice. They do all the work themselves in their claim, and the other day made a clean-up of several dollars. These youngsters take as much interest in delving for the precious metal as old miners, and, considering their ages, they are experts.

PLACER.

IOWA HILL.—Cor. Placer *Herald*, Sept. 3: Prospecting still continues on the divide in spite of the Debris question. The upper divide is filled with prospectors, and some fine quartz ledges are being found. Alfred Nahor expects to strike gravel soon in the Giant Cap mine. The Sucker Flat mine still continues to pay as usual. The Mountain Gate at Damascus is doing well. Hidden Treasure mine has resumed work again after having refitted their tunnel with new iron rails in place of the wooden ones.

RICHER THAN EVER.—We have heard it reported that the Paragon—Breece & Wheeler's drift mine at Bath—is turning out richer than ever, and as an'evidence that the report is pretty well founded, we noticed in the Auburn Express office a few days ago a sack containing 62½ lbs. of gold bullion which had just come from Forest Hill, and which we were told was the result of a month's clean-up from this mine. There must have been at least $13,000 in the sack, which is not bad, considering they are situated so as to be able to work but comparatively few men.

RISING SUN MINE.—The latest official letter from the Supt. of the Rising Sun mine, at Colfax, says: New shaft is sinking through country rock, showing a fine ledge formation, carrying a vein as strong as that in 3d level of old shaft. This new part of mine is showing a development of ore that adds largely to value of property. No. 4 and No. 5 levels west from old shaft are being pushed ahead to intersect new shaft. These drifts both carry pay ore in the face. Ore in No. 5 shows coarse gold, and well distributed through quartz Hoisting works over new shaft are completed, and machinery works well. New mill is running regularly, and silver plates show ore now milling to be of good quality.

PLUMAS.

THE WESTERN.—Plumas *National*, Sept. 3: Bell & Co. are still getting big pay from their Western claims in Newtown Flat, and show some coarse gold for every clean-up. They certainly have the old lead, and the owners are positive that they have a large section of rich ground in front of them.

NEW MINING COMPANY.—On Wednesday last articles of incorporation were filed of the California prospect mining company. The principal place of business is Quincy. We have talked nt some length with the gentlemen interested in the matter, and for several reasons it seems to us that the proposed mode of action of the company is as well calculated is to secure safe and profitable investments as it could well be. It is essentially a home company, having been organized in Quincy by men of responsibility and good standing, and who are well known in this county. It is proposed to purchase no mining property whatever until it shall be bonded to the company for a period sufficiently long to enable a thorough examination of the same to be made by its own agents. Instead of risking large sums of money on the uncertainties of any one parcel of mining ground, the risk is to be divided among as many valuable tracts as the company may secure. This will furnish to those miners who possess valuable claims, but are unable by reason of limited means to develop them, the opportunity of offering their property to responsible men, receiving in return a fair price or a stock interest.

SIERRA.

ON THE LEAD.—*Mountain Messenger*, Sept. 3: The Bonanza gravel claim, Howland Flat, was lately sold, with some adjoining ground, to Cornish capitalists, for $300,000, to which was added $100,000 for working expenses. The first two months and a half $12,000 was realized over expenses, 1½% a month interest on the whole sum invested. Then, unfortunately, the main channel was temporarily lost, and the new owners ran behind $7,000. But the energetic and persevering Supt., M. L. Stangroom, Esq., did not for a moment despair of finding the gold lead, and encouraged the English company to spare neither coin nor muscle toward the attainment of that desirable result; and the outcome has proved the correctness of his theory. Once more is this property on a paying basis, with a fair chance to do far better in the near future, the present monthly net income being $5,000. One hundred and fifty carloads of gravel is being taken out per day, that yields $5.50 each. For a time they averaged $8. The highest reached was $200 for 8 carloads. The pay channel now runs about northeast. The gold assays 914 fine, and is worth $18.65 above melting expenses. The main tunnel is 4,000 ft in length; beyond gangways and breasts, 1,200 ft. The grade from mouth of tunnel to underground workings, 50 ft. Air tunnel, 1,000 ft long. Air shaft 375 ft in depth. Seventy-five men inside and 20 outside. The Bonanza now is one of the most promising gravel mines in Sierra, and the plucky stockholders have the best wishes of all our citizens for abundant prosperity.

THE Exchange gravel claim, Mount Criso, two weeks ago took out 11 ounces to the set of timbers, and has been doing well ever since; 8 men are at work. At the Swallow, 4 men are at work taking out considerable gold. Col. Baker has finished his clean-up at Grass Flat, and the returns were satisfactory for the disadvantages under which he was obliged to work this year. We wish him more success next season. At Poverty Hill, Hudron, Kingdon & Co. have their tunnel in over 3,000 ft, which required 14 years to run, through hard rock, at an outlay of $200,000. Estimated expenses of sluices to be placed in tunnel, $10,000. By next spring everything will be in order for work, and this claim will then be one of the most remunerative in Sierra. J. ft. Thomas is experimenting with his new boring machine with encouraging success on the ridge between Gibsonville and La Porte. He has found several rich gravel channels, that are soon to be developed, backed by all the necessary capital. The Queen Gravel Co., Port Wine, had a fair gold harvest this season. The Ohio Co., Wahoo, are employing 40 men, and sluicing out large amounts of gold. The French Co., Port Wine, are putting their diggings in order for next year. They have done well this season. U. S. Mineral Surveyor, Chas. W. Hendel, is surveying the tunnel, now in f,200 ft, of the St. Lawrence claim, Port Wine, in the north side of Iowa ridge. A Burleigh drill is soon to be operated there. Bunker Hill gravel claim, Little Grizzly, now yields $20 a day to the pick.

NUGGET.—It is currently reported at Forest City, that some person, as yet to learn and an anxious world unknown, picked up on the ridge above the Pliocene, a piece of float quartz containing 93 ounces of gold. The name of the person and the exact locality of the find are as yet kept a secret, for the purpose of enabling the lucky man to find the ledge from whence it came. The old Empire ground, Howland Flat, Louis Goss, lessee, is yielding some over expenses. Gold averages $66 fine. Forty-eight men inside, and 5 outside. One gangway runs 680 ft toward Bonanza, 80 ft below its works, and 5 ft above bedrock, through hard cemented, blue washed gravel—all of which that was sluiced to the right, yielded in one month $2,480 to 30 picks. The drift claim of Brundridge & Weimer, St. Louis, has paid well this season.

RICH YIELD.—Twenty-four hundred dollars were sluiced out of the gravel at the Bunker Hill, Little Grizzly, in 4 weeks, to 6 picks. Owing to the bad air but few men can be worked. Last run made paid $18 to the hand per day. We saw 122 ounces of gold from this claim being weighed the other day, with $16 50 per ounce, by D. McKeever, at his store in Poker Flat, which reminded our old-timer, T. Clegborn, of the good old days when the nuggets were taken out of the creek by the bushel.

CIMSONVILLE.—Union Co. have an incline down about 100 ft to nles appearing bedrock. Main tunnel is in 5,000 ft. Front channel was worked out years ago. The boys are are now running for the back lead. The nights are breezy, with heavy frosts. Bootjack are working 2 men on a shift, cleaning out the Chalcedony tunnel. Rich gravel is expected not far ahead.

NEVADA.

WASHOE DISTRICT.

CON. VIRGINIA.—*Enterprise*, Sept. 4: The joint Best & Belcher crosscut has been advanced 26 ft. The joint California winze has been sunk and timbered 7 ft, and have completed setting the hoisting engine.

CALIFORNIA.—During the past week 90 tons of ore have been extracted from the 2000 level. A station is being cut out in the joint Ophir winze at the 2700 level.

MEXICAN.—The joint Union Con. east winze on the 2500 level has been sunk and timbered 9 ft.

SIERRA NEVADA.—East crosscut No. 1 on the 2500 level has been extended 30 ft, and No. 4 crosscut 31 ft. The main north lateral drift has been advanced 32 ft. Drill hole No. 2 has been extended 195 ft, and drill hole No. 3 228 ft.

UNION SHAFT.—Are repairing the 1600 drift to the Sutro tunnel connection, and easing timbers at the 2300 level.

UTAH.—During the past week the incline has been sunk and timbered 20 ft. The west crosscut on the 400 level has been extended 17 ft.

GENIR.—A station is being cut out at the 2700 level of the joint California winze.

UNION CON.—The drift west from the joint Sierra Nevada winze has been extended 20 ft.

ALTA.—The pump station at the 2150 level is completed, and are now excavating at the 1900 level for a counterbalance for the rods.

NEW WELLS-FARGO.—The south lateral drift on the 500 level has been extended 14 ft. The vein material on the face is still looking well and giving low assays.

YELLOW JACKET.—The north lateral drift on the 3000 level has been advanced 38 ft during the past week, making the present length of the same 138 ft from the switch. The ground in this drift continues very hard and free of water.

KENTUCK.—On the 340 level have gone west 5 ft 2 sets high in low-grade filling; worked north 5 ft 3 sets high. In the north drift, same level, have gone north 5 ft 3 sets high; started an uprise. Have assorted and piled up 8 tons of low-grade ore per day.

CANDELARIA DISTRICT.

NORTHERN BELLE.—*True Fissure*, Sept. 3: The mine has shown few changes of importance during the week. The intermediate, between the 1st and 2d levels, continues to look well, and is producing ore of good average grade. The levels above the adit present the same appearance as in last report. The 10th, however, shows some improvement and promises well for the future. There are being extracted and sent to the mills 83 tons of ore daily. Both mills are running steadily and doing good work. Shipments of bullion for the week ending August 31st were $23,478 01. Shipments on August account to August 31st, $94,187.48. About $12,000 more will be added to the total shipments for August, making the amount shout $106,187.48.

MOUNT DIABLO.—The east drift from the bottom of winze No. 1, from the 3d level, shows improvement, and is giving ore assays from it averaging from $70 to $80. The west drift on the 2d level is looking very well, and showing a 2-ft ledge of ore that assays $100.

HOLMES.—The operations of this mine for the month of August have been the work done in the main tunnel, and that of opening out and running the lower tunnels to cut the ledge at a greater depth. The lower tunnel is now 40 ft in length, the face of the same being very hard ground.

ESMERALDA DISTRICT.

THE CENTENNIAL.—Esmeralda *Herald*, Sept. 3: Work still progresses in the incline, and fair progress for the week has been made. The ledge retains its width, and the ore is improving. The Centennial is destined to make its mark as a heavy bullion producer.

THE COMET.—The incline has reached a depth of 310 ft. The ledge averages 8 ft in width the entire distance, and we are informed that, without any sorting whatever, the ore will easily mill $60 per ton. Drifts have been run east and west, which demonstrate the fact that the same character of ore exists in both directions. Under Mr. Wells' superintendency everything in and about the mine moves like clock-work.

THE ROTHCHILD.—"Yank" Guptell is putting the mine in shape, so as to be able to do some good work during the winter in opening up the Rothchild.

THE HUMBOLDT WEST.—The work of developing this property goes steadily forward, and it is showing up nicely. There is no sign of the ledge growing less, nor of the ore being of lower grade as the work progresses. On the other hand, the ore is, if anything, a little better quality than in the crosscut at the 100 level.

GRANTSVILLE DISTRICT.

THE ALEXANDER.—*Bonanza*, Sept. 3: There are no new developments to report in either the Alexander or Brooklyn mines since my letter of a week ago. The Alexander stopes are looking well, and producing their usual amount of ore. In raising up above the No. 5 level, on the large ore body, we have passed through thin sulphuret into fine chloride, which is likely to continue to the surface.

THE BROOKLYN.—In the Brooklyn the No. 2 drift going west was advanced 10 ft through fine ore during the past week. The No. 3 drift, which is also being driven in the same direction, is showing some nice quartz.

ALEXANDER MILL.—The mill shut down yesterday to clean up and make the necessary monthly repairs. Will start up again to-morrow.

SAFFORD DISTRICT.

IMPROVEM.—Eureka *Sentinel*: A constant improvement is noted in the mines of Safford district, and the owners of claims there are greatly encouraged. Within the last few days some extraordinarily high assays have been obtained. We hear of several rangling above $500 to the ton. There can be no question that there is some very rich ore in the new district. The reaction has come, and nearly everybody believes the camp is going to pan out well.

ARIZONA.

MYERS DISTRICT.—Cor. *Journal*, Sept. 1: The famous Gunsight mine is a bonanza. At present, at the bottom of the 200-ft shaft, there is a crosscut of 22 ft, all in ore that will assay $75. The next company working in the camp is the Montezuma mining company, and as far as they have developed their mines, this McLellan and Montezuma, they have made a good showing, and from appearances will be the first to erect reduction works. The Mineral Bed is that down. Mr. M. Campbell is working his Red Buck mine and Julia mine, and from the showing on the bottom of the Julia mine 20 ft down, there is a 4-ft ledge of good ore that will assay $175 per ton. The Red Buck is the south extension of the Gunsight mine. The extension of Silver Cirt is down 100 ft in good ore. There are several good locations and mines in this camp. At present assessment work is the most of importance.

TOMBSTONE.—Cor. *Arizona Journal*, September 3: At Grand Central a prospect drift has been run on the 300 level, resulting in the uncovering of a large body of rich carbonate ore from an entirely new part of the mine.

ALTA MINE.—The very hard rock noticed some time since has at last been got through, and they are now sinking at the rate of 3 ft per day in a bed of highly mineralized porphyry, which is supposed to form the hanging wall of their ledge which crops boldly out 300 ft west of the shaft.

ALPS MINE.—This mine adjoins the Alta on the southeast, and is sinking a shaft near the center of the claim, on a small vein which promises well.

INDEPENDENCE.—A shaft was started on the east side line (south of Alta bill) on some croppings showing mineral. This has been followed down 12 ft with most encouraging results, the rich carbonate vein was struck.

SCRATCH MINE (San Pedro Co.)—It lately started up again, under the superintendency of John Newsmoake, late of Tucson, and from the improvements noticeable, I conclude that work on this property will proceed on a business basis. They have stopped sinking, and are drifting northeast and southwest from the 100-ft station.

MANY miners have applied for patente to their ground, but few have as yet secured them, as in most cases adverse claims have been filed, many of which have no foundation whatever, being simply blackmailing arrangements.

SOUTH PIONEER.—Pinal *Drill*, Sept. 2: The South Pioneer Company is a Globe organization. Her leading capitalists, miners and merchants, own the stock. The company has worked quietly and industriously to develop its property. They have expended $3,000 in building a good road from Dripping spring to their mine. They have bought, and is now on the way to the mine, steam pumping and bolsting works. Forty-six men are on their pay roll. There are 3 shafts, the deepest 80 ft, and one drift 90 ft long, all in high-grade ore. Eighty-seven tons of ore have been shipped to San Francisco, averaging $219 per ton. There is on the dump over 200 tons of ore worth about $200 per ton. Every opening in the mine is in rich ore. Everyone who has visited the property report it one of the best in the district. "Common fame" pronounces it a mine of great value. Its officers are men of the highest standing and experienced miners. The mine is situated near the summit of the Pinal mountains, in the immediate vicinity of fine timber and water, 22 miles from Globe in a south course.

GROOM CREEK.—*Arizona Miner*, Sept. 2: Mr. Merrington, superintendent of the Chicago and other mines on Groom creek, is doing good work for this section of Arizona. Work already done by his men on the Chicago shows that mine in a very rich light. An assay made a few days ago gave a result of $800 gold and about $200 silver to the ton. Mr. Abe Kiewe, a storekeeper of Big Bug district, arrived here recently. He praises a mine on which Messrs. Stoddard & Collins have men at work. This mine is near the head of Big Bug creek, not far from the famous Bello mine. The pay rock is fully 4 ft thick. Mr. Brown, who has been at work on the McCrackin mill, Mohave county, came to Prescott yesterday. He left the mill running and paying. The Silver King has made another shipment of $25,000. Mr. Buffum is preparing to start his Crook Canyon mill. It will first crush 150 tons of ore from the Lawrence mine. Frank Murphy and others are prospecting the Providence lode. Flint & Go.'s steam rastras, near the head of the Hassayampa, will be running in a few days.

DAKOTA.

GALENA DISTRICT.—Black Hills *News*, Sept. 3: There is no camp in the Hills where the outlook is brighter than at Galena. The people are full of business and there appears to be more money in circulation in proportion to the population than in any other portion of the Hills. The Sitting Bull is still putting out a large amount of high-grade ore, which is sent off to Omaha for reduction. Col. Davey is working a large force of men on the mines as well as on his ditches.

MR. VICTOR RUSS is rebuilding the old smelter on a new plan, and within a few days will convince the people that ores can be successfully treated at home.

THE Red Jacket mine is making preparations for shipping its ores to Omaha, while the Silver King will soon pass into the hands of New York parties.

THE MINNESOTA MINE.—The Minnesota mine, which is located in Pennington county, and which was some time since bonded to Judge Bennett, Gov. Ordway and others, for $45,000, is said by those who ought to know whereof they speak, to be as good a mine as is to-day in the Hills. Judge B. already thinks himself the prospective owner of a second Homestake, and we hope he is. The Governor, who is in New York, will, with others, organize a stock company and issue sufficient stock to furnish a good working capital, and for the erection or purchase of a 60 or 80-stamp mill. Success to the enterprise.

BEAR BUTTE CREEK.—From the divide at the head of Spruce gulch to the crossing of Bear Butte creek, the country is a vast wood and timber camp. There is thousands of cords of wood piled up and marked H. S. —Homestake Co.

Two miles this side of Bear Butte creek crossing there is an immense quartz reef, running across the country at right angles with the road, and precipitous on the Bear Butte side. It is the jumping off place of an extended plateau, commencing at the ridge at the head of Twobit gulch. This quartzite reef pitches in this direction at an anglo of about 20 degrees.

IN the opinion of this reporter that country is a good one for the prospector. If there is $8 ore on the surface close to the reef, there may be, and we think there is, $100 ore 200 ft back of it, and if this is so, there is an immense field of it, as the reef in question is miles in extent, and the formation is the same throughout the entire distance.

IDAHO.

BULLION MINES.—Wood River *Times*, Aug. 31: The Bullion, Mayflower, Jay Gould, G. K., Ophir, Eureka and Idahoan mines continue to attract visitors to Wood River. These mines have now passed out of the lists of prospects, and are mines indeed. Their ore-yield seems to be limited only by the impossibility of getting enough teams to haul the ore away. A number of men were laid off last week from this cause, but arrangements are being made at railroad points to have teams come in light to haul ore away, and in a few days a large addition will be made to the number at work. About 175 men are now employed. Next month about 250 men will be put to work. This is only on the principal mines. Of course, the many small claims being opened up will continue as before.

NEW STRIKES IN THE EUREKA.—A new strike was made in the Eureka last Saturday. In running the tunnel from the bottom of the shaft the ore pinched out after the tunnel had got in about 30 ft. Ten ft further, ore came in again, and on Monday afternoon the ore vein in the breast of the tunnel was fully 2 ft wide, and assayed about 125 ounces.

THE hoisting works of the Bullion mine are working smoothly. Machinery has been ordered for the Mayflower and for the Eureka. There is no foundation for the reported sale of the Mayflower.

ATLANTA NEWS.—Cor. *Idaho World*: The Buffalo Co. are repairing their mill and will start up about Sept. 15th. Their mine is turning out very rich ore. The Monarch Co. are working 8 men. This is most likely the most extensive and richest mine in Alturas county. They have, so far, developed a chimney of about 700 ft in length, and still continuing on. The greatest depth obtained on this mine is 200 ft where the ledge is immense. A 20-stamp mill and hoisting works will be erected in the spring. Queens river mines are at present idle. Considerable travel through to Sawtooth where a saw-mill and 20-stamp quartz mill is going up. The saw-mill will be running by the 28th. Billy Short has struck a big mine near Galena. I visited Julian Hill's mine and found a very good looking mine.

MONTANA.

ALICE.—*Inter-Mountain*, Sept. 3: The center seam of pay ore on the 700 level of the Alice continues to improve with the extension of the drifts. Supt. Hall states that yesterday some ore of very excellent grade was encountered in the face of the east drift, and that native silver abounds throughout the quartz now being extracted.

MAONA CHARTA.—The recent developments in this magnificent property are of a very encouraging character, and give assurance in the near future of a great and permanent productive capacity.

STAR WEST.—Since operations were resumed on this property under the management of Mr. Williams, the sinking of the main incline has been prosecuted with vigor. For several weeks past the grade of the ore has been somewhat low, but within the past few days a great improvement in quality has occurred. The width of the pay ore body in now about 18 inches, and sample assays average $125 per ton.

BELL.—Mr. Meader is very quietly but energetically pushing developments on this mine, which has been visited of late by many well-known mining operators, who have united in expressing a highly favorable opinion of the property. Since our last report the whim shaft and the winze from the 100 level have been connected at a depth of 300 ft.

ANSELMO.—Although Mr. Lacaff is kept very busy in superintending operations on the Sheridan, he still has time to direct the development of the Anselmo in such a way as to secure the most profitable results from his expenditures. That he is meeting with success, and that the Anselmo is to-day one of the best paying properties in the district, he makes no attempt to disguise. The 15 tons of ore which the Anselmo yields every day are being worked to a handsome profit at the Silver Bow mill in spite of the fact that he is required to pay $27 per ton for its reduction.

NEW MEXICO.

THE AZTEC MINE.—*News and Press*, Sept. 3: Mr. Chas. Smith has thrown up his tunnel contract on this famous old mine, the wet weather and hard rock proving too much for him. We understand from Mr. Sherwin, the President of the Maxwell Co., that work will be at once resumed and vigorously pushed by both day and night shifts. There is considerable dead work necessary to reopen this mine, as the old shafts and tunnels have become dangerous by disuse.

RICH ORE.—Jesus C. Abreu, the wealthy ranchman of Rayado, recently showed us some specimens of gold ore that were rich enough to excite the cupidity of the most blase mining man. The ore was a greenish white quartz that had the appearance of being silver rather than gold-bearing but for the visible evidence to the contrary. The ore was filled with rounded shot gold, from the size of a pin head to 2 or 3 times that size, that seemed to have melted. It was different in character from any that we have before seen from this district. We could learn nothing concerning this discovery except that it was brought to Mr. Abreu by an old man who had found it by accident.

OREGON.

MINING.—*Bedrock Democrat*, Sept. 3: For some time our enterprising townsman, Chas. St. Louis, has been at work in Washington gulch running a tunnel to a basin which is reported to be very rich. The tunnel is now 475 ft long, and lacks about 15 ft of being completed. The tunnel is being run for the purpose of getting fall and a place to lay a flume.

BIG APPLEGATE.—*Democratic Times*: Wm. Heeley came down from Big Applegate this week, from whom we learn that the dam at the head of the Squaw Lake Co's. ditch will soon be completed. The ditch itself will also be cleaned out and put in repair soon. This looks as if the company intended to commence mining operations in the near future.

THE Sterling Mining Co. is enlarging its ditch for more extensive operations.

J. B. FARLEY and W. H. Gilson have sold their claim on Sterling creek to Ankeny & Co for $500.

A NUMBER of men went up to the Squaw Lake Company's ditch yesterday to commence work, and more will follow. We learn that the bulkheads will soon be replaced.

GALICE.—Green Bros. of Galice creek, are taking out ore of a fine quality. Their tunnel is approaching completion and the company then expects to inaugurate operations of a more extensive nature than ever.

FOOT'S CREEK.—Geo. W. Lance, of Foot's creek, was in town this week, who informed us that his company are about commencing preparations for winter. Improved apparatus will be procured and more extensive operations than ever inaugurated. The Sterling Mining Co. finished cleaning up last week, and the result is said to have been flattering. Preparations for winter will immediately be commenced. The extension of the ditch is now going on and a huge reservoir will soon be built.

UTAH.

THE COMET.—*Southern Utah Times*: Work has now been begun in earnest upon this most promising property. During the past week a large amount of tunneling has been accomplished under the direction of Supt. Morrison, who reports a new discovery of ore, giving an assay of 20% copper. The extension of the property, known as the Southern Utah Times, will no doubt be developed soon by the owners, the Morrison Bros. and King.

THREE years ago Lieutenant-Governor Tabor, of Colorado, was only the proprietor of a small store in a mining camp, and provided two miners with food and outfit for a prospecting tour around Leadville, stipulating for a certain interest in any claim they might find. They soon discovered the Little Pittsburg mine, from which Mr. Tabor derived a large fortune, since which he has been so successful in mining operations that he is estimated to be worth several millions.

THE high price of lead should start many of the low grade mines in Utah. There is a prospect of good prices continuing as long as the building boom lasts, and the boom may be said to have hardly commenced.

Who Next, after the Hydraulics.

The owners of quartz and drift mines are at last fully awake to the danger that threatens their rights and property through the conspiracy of the lawyers, who are manipulating the debris suits, says the Marysville *Express*. They now understand full well what the term "fouling the rivers" means. They know to a certainty that they cannot wash an ounce of gold from drift or quartz and not foul the rivers. They have also come to know that the promoters of this unnecessary litigation planned in the ontset to divide the hydranlic mining interests from those of quartz and drifting, in this contest, waging war on the former and conciliating and pacifying the latter. Thus by taking each industry in detail the contest would be much easier and the spoils far greater than to antagonize both interests at once. Once stop hydraulic mining and see how quickly the enemy will move on the quartz men and drifters. These tactics do honor to the cunning of plaintiff's attorneys, but the operators of quartz and drift mines are not the least intelligent class of men in the world, and if defeated in the protection of their rights and property it will be while standing shoulder to shoulder with all eystems of gold and silver mining. When at last gold mining shall have been prohibited, one thing will yet remain to be done. Gather together every scrap and page of the glorious history of the Golden State, burn them to ashes, and re-christen her with some new and unknown name. Then when other nations ask to know regarding our gold basis, with how much pride can we point to our potato and melon patches, founded by the flow of "slickens."

Old Meadow Lake.—The indications are that the Meadow Lake mines, which have been lingering along for so many years, may yet become a source of permanent prosperity to many hundreds of miners. The old town on the lake may one day be rebuilt, and may yet far exceed in glory all that it was in its pristine days. The iron rock—that rock upon which so many of the Comstockers "split," and not only split, but busted wide open in early days—seems now to be better understood, and it would appear, from the following item from the Truckee *Republican*, is being successfully and profitably worked: "Two mills are now in operation in Carlisle district, and both of the mines on which they are operating are owned almost exclusively by citizens of Truckee. The rock being crushed yields on an average $70 per ton. The predictions so often indulged in that Meadow Lake was 'gone in' do not seem to prove true. The Cisco Con., another large mine in that vicinity, will soon have a large mill going, with a full force of hands. Taken altogether the prospects are favorable for quite a lively mining camp in that region in the course of a year or two."

No Drunken Miners.—The Keystone mine management, of Amador City, has adopted a principle with regard to the employment and retention of laborers at that mine, which it would be well for every other enterprise to follow, where laborers are employed. No man will be hired there who is in the habit of getting drunk, nor will any one already employed be retained if he gets drunk during his employment. This system will do more to promote temperance than all the eloquent speech-making and writing of our temperance agitators combined. It will keep the men in better condition to do good work, and prevent their losing much time, besides guarding them in economy and preventing want and discord in their families. If this rule were made universal among all employing institutions there would be fewer drunkards among the industrious classes, and less reason for good, sober and competent workmen to complain of the want of employment.

Copper Smelting.—D. E. Jones, of Bodie, and San Francisco parties have taken hold of the Bluestone copper mine in Jordan district, one mile from the mouth of Mill Creek canyon, and on Wednesday, August 31st, ground was broken for the erection of a smelter, which will be erected immediately. The Bluestone is a large and very rich copper vein, carrying about 72% of copper, $10 to $12 per ton in silver, and traces of gold. The facilities for smelting are excellent, wood and water being abundant, and the company has just located ample ground for smelting works on that branch of Mill creek that cuts across the Bodie road to the northward Grant's station, and sweeps along the base of the hill under the mine.

Strike in the Eberhardt Tunnel.—The *Sentinel* learns that Captain Frank Drake has at last struck ore in the Eberhardt tunnel, White Pine district. Just how big a body has been encountered is not yet known, though there is no doubt that the development is a most important one. At last accounts the ore had been penetrated several ft. and was still holding out. It is said to be of satisfactory grade. The Captain and his company deserve this piece of good luck. They have held on to the enterprise for years under discouraging circumstances.

A New Coloring Matter.—A Vienna chemist has succeeded in producing a new coloring matter on silk, which is a nice blue by day and a beautiful pink by artificial light. The alcoholic solution of this color is dark violet in a transparent, but red in direct light.

The Event and Its Influences.

The case of President Garfield is becoming notable for its alternations of light and shade. On Saturday last hope well nigh departed, and the people prepared to mourn and to think upon fitting ways to express their grief and their respect for the memory of the dead. Quickly there was a reawakening of mind and strength, and the people again rejoiced at the chances of recovery. Thus the matter stands at this writing. The President is much better than he has been, and yet there must be much more progress gained before the President will be out of danger.

The incidents of the President's illness will not be forgotten during the present generation. Never before has the public mind dwelt upon the significance of symptoms and been led to study the relations between pulse, respiration and temperature. Never has the danger and distress of a gun-shot wound been so widely appreciated, and if the thought on this subject should lead to more restricted use of weapons in low as well as in high places, it would be a public benefit.

There has been running through the accounts of the President's sufferings which have come to the daily papers, veins of sickly sentimentalism as well as lofty heroism. The abundance of gush is, however, to be attributed to the reporters, who have free use of the wires, and it is hardly worth while to get excited about it, as some of our exchanges have been disposed to do. The debris of sentimentality may be overlooked, as the case has given the country some gleams of true sentiment, courage and bravery, which it will benefit all who contemplate them. The bravery of Mrs. Garfield, when the doctors were disposed to lose all confidence and hope, will pass into history. It appears that the surgeons, after learning the symptoms of the morning, decided that it was useless longer to continue the struggle, and two of their number were selected to wait upon Mrs. Garfield and inform her that medical science could do no more, and she must prepare for the worst. The interview which occurred between these surgeons and Mrs. Garfield will, if reports be true, be regarded as one of the most dramatic incidents in this extraordinary case. Captain Henry, Marshal of the District, and a friend of the President and his family, says that Mrs. Garfield heard the news, and smothering her emotion, arose and said:

"Gentlemen, you shall not give him up. He is not going to die. He is going to live. I feel, I know it. Go back to your post, and leave it not until every remedy is exhausted, and until death itself has set its seal upon him, for I will not believe that he is dying. Go back, and do what you can; you cannot do more; but don't give up. I am his wife, and I say we will not give him up until the end itself is upon us."

Mrs. Garfield has never surrendered more than a moment or two at a time to her grief, and then she has retired to her room, and, after a brief absence, returned to her post of duty at the President's bedside. The conduct of Mrs. Garfield is calculated to endear her to the hearts of the American people, for the love and respect for a brave spirit is irresistible. The fact that other women are just as brave and heroic in their obscure places as she has been in the face of the world does not detract from her glory, nor does her fame take from their nobility. Rather should she be gladly accepted as the exponent of the courage and devotion and trust which are characteristics of noble women everywhere, and all the praise which she receives should be taken as a tribute to all true womanhood and wifehood.

The President has suffered severely, but not in vain. The stroke at his life was the death blow of political policies which were gaining alarming prevalence, but are now abhorrent and everywhere denounced. Should he rise, as we trust he may, his opportunity for reforms will be immeasurable, for the people will be beside him in every true action and interested opponents will fly through alarm at their own weakness. Even should he die, his long weeks of torture will not have been endured in vain, for any change in administration will now be less dangerous than would have been an immediate transfer of power. We count it sure that the sentiment of the American people is much higher and the determination for a pure and disinterested administration of public affairs much stronger than it was three months ago.

Paint for Fire Brick.—There should be nothing very difficult in making a mixture of mineral pigments which will closely imitate brick red. The work of renovating brick fronts is usually confined to a few painters who make it a specialty. It requires substantial scaffolding and other special paraphernalia which the general run of painters do not have. Those who undertake this class of work, make something of a secret of their particular mixture; but a little experimenting with small quantities of the common red pigments will enable any intelligent person to strike the proper shade, which, on drying, will most closely approximate to the desired brick color. In the preparation of the pigment for use the same method would be followed as in the case of any paint for out-door work. A mixture of Venetian red and brick dust in suitable proportions in oil, will probably come very close to the material used by house painters for this purpose.—*Manufacturer and Builder.*

Glass Floorings are now being made in France, the upper surface being molded in diamonds.

Mr. Scott's Art Collection.

Mr. Irving M. Scott, well-known as one of our most public spirited citizens, ought to consider himself a fortunate man. He is held in high honor by his fellow citizens; has held many positions of trust; is considered one of the best mechanics in the city; has built up one of our most flourishing home industries, employing hundreds of men; has been President of the Mechanics' Institute and of the Art Association, and in fact of every organization of note he ever joined; has traveled around the world and brought back to his fellow-workers in this city information of great value to them, and which he gave them free in public lectures, not hiding his observations and keeping them to himself; and all this while yet a young man. And beyond this he has, which is perhaps more uncommon, taste and judgment enough to have made the best collection of paintings in the city. With characteristic good nature he has placed these art treasures in the fair, where the public could enjoy them. And the public has enjoyed them. Thousands of people who have no knowledge of art whatever, but can tell when a picture pleases them, have examined with pleasure the many gems in Mr. Scott's collection. They are pictures one can understand. They are of modern life, and represent things, many of them, with which we are familiar. And although it is the correct thing to admire the "old masters," most people will privately applaud Mr. Scott's judgment in collecting the gems of the painters of to-day. What could be more lifelike and true to nature than Brown's "Sure Thing" and "Dress Parade," the latter admired by all as a masterpiece of a master. Of local artists' work, Rix's "Pollard Willows," Virgil Williams' "Chiccory Girl," S. M. Brooks' "Fish and Vegetables," Hill's "Yosemite in Early Morning," Williams' "Peasant Pilgrims," Mrs. Keith's "Fruits," Keith's "Mt Tamalpais," and "Mt St. Helena," Yelland's glorious "Glimpse of Monterey Bay," Nahl's "California Indians," Bradford's "Greenland's Icy Mountains," Deuny's "Drifting About," Tavernier's "Waiting for the Montezuma," all are deserving of praise and are justly admired. Our citizens are proud to think the authors of these magnificent works are residents among us, and also that the owner of them all is here and will keep them here. Pilz's "Feeding the Magpie," Hintz's "Endangered Luncheon," Nargot's "The Marguerite," Bonguereau's "Pensive," Van der Venne's "Gypsy Tent," Michis' "Double Indiscretion," Schreyers' "Bursting Bomb," Richter's "Song of the "Harem," are all magnificent pieces of work worthy of their famous authors. The pictures speak for themselves, as they hang on the walls of the art gallery of the fair, and a criticism at our hands would be out of place; yet we cannot refrain from alluding to them and their public-spirited owner, to whom the citizens of San Francisco are indebted, among other things, for his generosity in giving them an opportunity to examine these art treasures.—*Mechanics' Fair Daily.*

A Curious Strike.

The Virginia *Enterprise* says: There was a pretty well authenticated report on the street last evening that a man living in the northwestern part of the city—up near the big water tank of the Ophir company—made a rich strike some two or three days ago. He was engaged in repairing and setting back a dilapidated bulkhead in front of his lot, when he struck into a three-ft. vein of decomposed material completely filled with pure gold. This is said to be the same kind of rich vein stuff that was encountered near the surface when the first discovery was made at the Ophir in early days.

The man who struck this baby bonanza had been at work at the Union shaft, but, being laid off, concluded to fix up things a little about his house and lot. If all we hear be true, he has made very good wages, as it is said he got out about $15,000 before the Ophir management heard of the matter and requested him to desist from his labors.

His wife also participated in the toil of extracting the shining metal from the little home mine, and it is said she has a half-gallon glass jar nearly full of gold that she herself pounded out of gathered lumps.

It is hard to keep "ducks out of a dough dish," and we are informed that some workmen found their way back to the vein night before last and got out about $1,500.

The vein is supposed to be a feeder that made out toward that point from the old Ophir vein, and this is doubtless the case. It might never have been discovered but for the tumbling down of the old bulkhead. One old surface tunnel passes through the ground some distance to the northward of the deposit and another to the southward. Thus the rich pocket was left concealed between.

Had the discoverer covered up his find with a new bulkhead so constructed as to leave a small "coyote hole," by which to pass in and out, he might have worked his vein for months, had he used proper caution in his mining operations.

Others will now doubtless begin prospecting along the hillsides west of town. For aught we know there may be "millions in it."

New Mexico is clamoring for more reduction works.

Odd Ways of Putting Things.

Putting things in an odd way is the vocation of professed wits and humorists; but they are not permitted at all times to monopolize the privilege, as we shall proceed to show.

Mr. Naismyth, a celebrated Edinburg dentist, finding himself inconvenienced by the noise made by the students of the Free Church College, wrote to request that they would be more moderate in their applause, or find some other way of expressing it than stamping upon the floor. Dr. Chalmers, the well-known divine, laid the dentist's complaint before the offenders, and begged them to avoid giving cause for its repetition, saying he should be sorry indeed to give offence to a gentleman so much in the mouths of the public.

When President of the United States, Abraham Lincoln was inclined to a rough-and-ready style of argument.

"It is a disgrace to the country," said a disgusted government clerk, "that such a boor should be President!" What made him say so was this. He had asked the President to give a brother, who had been honorably discharged from the army, a place in the Civil Service. "Let me see," said Lincoln, "I believe you yourself are a clerk in one of the departments?" "Yes, sir," said the applicant; "I am in the Treasury Department." I thought so," continued the President. "And your father holds an office in Washington, does he not?" Yes, sir; he is the chief of a bureau in the War Department," replied the office beggar, beginning to feel rather uncomfortable. "Is there any other member of your family holding office under the government?" was the next query, answered with: "Yes, sir; I have a younger brother in the Interior Department." Whereupon Lincoln put him out of his misery by saying: "Well, then, all I have to say to you is that there are too many hogs, and too little fodder!"

When Naples was ruled by King Bomba, his majesty one day paid a visit to the ship of an English commodore, lying in the bay. While the commodore was receiving his royal visitor on the quarter-deck, a member of the Neapolitan suite, in brilliant uniform, cruising about amidships, mistook a wind-sail for a pillar, and leaning against it, suddenly went below head foremost. The only witness of the accident, an old tar, thereupon made for the quarter-deck, and having saluted, said: "I beg pardon, commodore, but one of them are kings has fell down the hatchway!"

A gentleman, traveling in the same carriage as the pretty daughter of a rich Pennsylvania lumber merchant, chatted with her until she grew drowsy, when he vacated his seat for one by the side of a schrewd-looking old fellow. As they were whirling by a high mountain, his neighbor called his attention to it, and went on: "Six or eight years ago that mountain was covered with a fine forest, worth at least $10,000. Now there are nothing but stumps, and the land is scarcely worth a cent. The net produce of that mountain lies over there in that seat. It has taken all that lumber which her father owned to raise and educate that girl. Some of you young men, if you were given your choice between the mountain yonder, as it now stands, and the net produce on that seat, would take the net produce; but give me the stumps!"

The Comstock.

We see a great many flings against the Comstock in papers far and near—in this State and adjoining States and Territories—but when it comes right down to business and to dollars and cents we should like anyone to point out a better place than this same old much-maligned Comstock.

The majority of those who abuse the Comstock only utter that which they hunger and thirst to see. All men of course know and admit that our towns are not thronged and booming and bubbling and roaring as they were in days when millions per month were being brought to the surface; but, dull as times may be with us, they are a conflagration and a whirlwind to those seen in some of the towns and cities that are pretending to weep for us.

If it can be shown that there is a better place anywhere on the Pacific coast, let it be done. We are quite willing to be made acquainted with such a place. Our people are not so prejudiced as to remain in this inhospitable region against reason and interest. They have quite sufficient money and enterprise to go to the better place—a place even the slightest shade better—as soon as they are informed of its whereabouts.

We are becoming a little tired of the crocodile tears and the hypocritical blubberings seen and heard for "these many days" in various quarters. Show us the better land or the better town, and we will march forth and take possession of it, or at least a goodly share of it. Let those who have tears to shed, shed them at home, and for themselves.

Our people are well acquainted with the situation of every town and camp on the Pacific coast. They have scouted forth and spied the nakedness of many much-vaunted lands and the poverty of many greatly-puffed towns. As of old Noah sent forth from the ark his winged messengers, so we have set forth our scouts, and all have returned to us without having found rest for the sole of their feet.—*Enterprise.*

Mines in New York.

As quite a number of California mines are incorporated under the laws of New York, the following from the *Mining Record* is important to those interested:

In our last issue, under the head of "Answers to Queries," we gave certain requirements of the law on the part of the officials of mining companies organized under the laws of this State, with certain rights on the part of shareholders to information in regard to the financial affairs of such companies, so important that we have thought it best for all concerned to republish and call attention to the following paragraph:

"Wherever any person or persons owning 5% of the capital stock of any company not exceeding $100,000, or any person or persons owning 8% of the capital stock of any company exceeding $100,000 formed under the provisions of this act, shall present a written request to the treasurer thereof that they desire a statement of the affairs of such company, it shall be the duty of such treasurer to make a statement of the affairs of such company, *under oath*, embracing a particular account of all its assets and liabilities in minute detail, and to deliver such statement to the person who presented the said written request to said treasurer within twenty days after such presentation, and shall also at the same time place and keep on file in his office, for six months thereafter, a copy of such statement, etc.

"If such treasurer shall neglect or refuse to comply with any of the provisions of this act, he shall forfeit and pay to the persons presenting said written request the sum of $50, and the further sum of $10 for every twenty-four hours thereafter, until such statement shall be furnished, to be sued for and recovered in any court having cognizance thereof."

We would advise treasurers of mining companies to be prepared to make these detailed statements of the affairs of their respective companies, and we venture this advice because in certain cases in which we have applied for similar information to such sources, we have been answered that the information was only to be had at the office of the superintendent of the mine itself.

Oregon's Mines.

From J. W. Virtue, banker of Baker City, who is one of the oldest settlers in the county and whose extensive connection with the leading mining enterprises, says the *Bunch Grass Gazette*, entitles him to be recognized as authority, we have gleaned much valuable information in regard to the mineral resources of Baker county. His estimates the amount of gold and silver produced from Baker, Union and Grant counties since the discovery of gold in 1862, from placers, at forty-five millions. The yearly products now amount to one and one-half millions, principally from shallow diggings, from 3 to 30 feet deep. Very few of our "old river channel" gravel mines from 60 to 200 feet deep have been worked, although a large amount of this class of mining ground is to be found in Baker, Union and Grant counties. Some of these deep gravel channels have been prospected on the head of Powder river which averages $136,000 per acre. It requires capital to open these immense deposits and furnish the necessary amount of water, but the water can be procured without the expenditure of very great sums of money, and the gold products of these counties will be greater twenty years hence, from placer and gravel mining, than ever before. Quartz mining is in its infancy, and yet the yearly product is about $650,000, and the yield from that source has been about eight millions. Baker has the following mills: Connor Creek, 20 stamps; Gold Hill, 10; Moore & Eastahrooks, 2; New England & Oregon Mining Company (organized in Concord, N. H., a very responsible company), 5, silver; Virtue Gold and Silver Mining Company, 20, with steam hoisting and pumping works; Mammoth, 5; Tom Payne, 2. Besides about 30 arastras, Grant has about 40 stamps, the principal mill being the Monumental, 15; and supplied with all the modern improvements. Over three hundred gold and silver lodes are being developed, awaiting capital to put up machinery, prominent among which are Cable & Sons' group of six mines, Cable Cove, Buffalo, Hazard, Silver King, California, Granite and Silver Peak.

A Lecture Experiment.—A brilliant experiment for presenting to an audience in a lecture-room a vivid imitation of the aurora can be performed by the following suggestion of Mr. Ackroyd: As close a representation of the aurora as can be drawn is painted upon a screen (presumably a dark screen) with Balmain's luminous paint, and hung up in the lecture-room, hidden from the view of the audience, until required, by an interposed curtain of dark tissue paper. At the proper time a piece of magnesium wire is burned in front of the painting, still hidden from the audience, and when the tissue paper is withdrawn the effect of the aurora will be found very faithfully reproduced and clearly defined. It remains visible for a long time. Many other curious and instructive experiments can be reproduced by the use of this and similar phosphorescent paints.

Magnetic Intensity of Iron.—According to Rinman's investigations the magnetic intensity of iron appears to increase with the increase of carbon. In three specimens of cast iron containing .09, .30 and .57% of carbon the magnetic intensity was 5.5, 9.5 and 11 respectively.—*Berg- und Hutten-Zeitung.*

Useful Information.

Origin of Petroleum and Coal.

The origin of petroleum is one of the most practically important puzzles which is just now agitating the scientific world. It is apparent to all that the supply of coal must eventually give out. Coal is undoubtedly a surface deposit. Should the same fact eventually prove true of coal-oil, the end to that product will probably be reached much sooner than that of coal.

The generally received theory is that petroleum is a product of coal by a process of natural distillation, similar to that which is sometimes practised on a small scale artificially. That theory is not a very satisfactory one, in view of the needy future ages. Quite as reasonable and a much more satisfying theory is that recently put forth by Professor Mendeljeff, who thinks that, on the first formation of the earth, vast reservoirs of inorganic iron and carbon existed in the interior of the globe. These were reached by the water condensing on the newly formed land, percolating beneath its surface. The heat decomposed the water into its component parts, oxygen and hydrogen, the first forming with the iron oxide of iron, the latter with the carbon, petroleum and other hydro-carbons. If this theory be the correct one, there still exists in the center of the earth reservoirs of petroleum that are to the sources as yet known as the ocean is to the spring whose waters finally find a resting-place in its bosom.

In connection with the above the following letter from Scranton, Penn., recently addressed to the editor of the *Engineering and Mining Journal* of New York, will no doubt be read with much interest:

"Sir: I have looked in your paper for several weeks past to see some notice of the remarkable material discovered in excavating for the new court-house of this place. Having seen nothing, I thought it my duty to science to report upon the same. First allow me to describe briefly the location. This building site is in the heart of the town, upon a square which formerly was a swamp, but some years ago was filled with cinder from the iron-works.

"On excavating for the court-house foundations, the cinder was first removed. This was five to six feet deep. After this came a bed of excellent peat, varying in depth from eight to twelve feet. Below the peat, a stratum of muck seperated the peat from the hard-pan below. In the muck were veins of tough black jelly, resembling in all manners, except its gelatinous character, anthracite coal—luster, color, fracture. When dried slowly, it solidifies into a hard, brittle substance, which would be considered by an ordinary observer as real anthracite coal. After hardening, it does not again soften in water, hot or cold. It burns at a red heat, and leaves an ash resembling the red ash of some coals. It flames on first ignition. The jelly is acted on by alkaline solutions.

"Some analyses have given only 20% of carbon in the dried state; but I think the poorer specimens contain a larger amount than this.

"Now I am strongly inclined to believe that this is a true key to the formation of coals, and have assumed the following hypotheses as worthy of experimental examination:

"First, the formation of a siliceous jelly from the action of water upon the silica in the vegetation. Second, is it possible for siliceous jelly to extract and absorb carbon from the carbonaceous fluids extracted from the overlying vegetable matter?

"Anyhow, here is a carbonized jelly; how was it formed? and does it resemble coal sufficiently to warrant a belief that coal was formed in this manner?

"I inclose some small samples of the dried substance; and if you can get any chemist to investigate the subject, will be pleased to forward samples of the gelatinous matter."

The New Process Flour.

The millstone is a thing of the past in flour manufacture, and its place is being rapidly taken by Hungarian steel rollers. By the new process the wheat is not ground, but cracked. The rollers are of steel, about thirty inches long and eight inches in diameter, and it takes five sets of them to complete the process of flour-making. Each set of rollers runs closer than the preceding, the last having little else but wheat-hulls and the waxy germs of the wheat which do not crack up. Under the old method this waxy germ was ground with the starchy portion and bolted through with the flour, but by the new process the germ is flattened out and sifted or bolted out, while the nutritious part of the wheat is crushed into flour. Between each set of rollers the wheat is bolted or sifted through coarse cloth. This cloth lets the disintegrated particles of wheat through and passes off the larger pieces, which are put through a closer set of rollers, and so on to the end of the operation.

To describe the process more minutely, we will take a single kernel of wheat and trace its course through its various stages: The kernel is passed between steel rollers on which are lined corrugations. This breaks the kernel into from six to eight pieces, and a great deal of starchy matter falls out. These pieces are passed over a cloth sieve and the starchy particles which pass through are the best portion of the wheat. The six cracked pieces of wheat after being sifted are passed through the second rollers, which are quite smooth, but not polished, and the kernel is by this time cracked into perhaps thirty-six pieces, and the crushed matter is bolted again. The thirty-six pieces are then run through a third set of rollers and cracked into about 216 pieces, and bolting again takes place. By this time all the best part of the wheat is bolted out, and finally nothing but the hulls, a few particles and the waxy germs remain. What is left is rolled through another set of rollers and again bolted, and the hulls and grains are ground upon an ordinary millstone. The process may be not inaptly described as "cracking and mashing," and with each successive step a lower-grade flour is produced.

A home-made weather-glass may be prepared as follows: Place in a long narrow bottle or test-tube, camphor gum, 2½ drachms; spirits of wine, 11 drachms. When the camphor is dissolved add the following mixture: water, 9 drachms; saltpeter, 38 grains; sal-ammoniac, 38 grains. Dissolve these salts in 9 drachms of water before mixing with the camphorated spirits, then shake the whole together. Cork up tight and seal with wax; then make a small hole through the cork with a red-hot needle, so as to have a small clean hole. Heavy atmosphere will cause the salts to rise; a light atmosphere, to fall. Cost of mixture, 10 or 15 cents.

New Bleaching Agent.—A bleaching liquor, patented by M. Cosse, in France, for vegetable fibres and fabrics therefrom, is formed out of a solution of chloride of lime, of variable concentration, according to the nature and strength of the fabric, in which a current of carbonic acid is injected. The chloride of lime, it is said, asserts a more energetic action than in the ordinary state, without being injurious to the fabric. The bleaching is conducted in the ordinary way, but on account of the greater power possessed by the new bleaching liquor, it allows the operation to be shortened and simplified.

Volatility of Sulphuric Acids.—A contributor to *Il Progresso* states that in operating in an atmosphere which had been dried with sulphuric acid he found that litmus paper was soon discolored and gradually disorganized. Hitherto it has generally been assumed that this acid is not volatile at ordinary temperature, and if the above statement should be confirmed it will be of some importance in both manufacture and analysis. It has been suggested that the evaporation of the acid may account for the sulphur rays sometimes noticed in Geissler tubes.

Birch Bark Rubber.—It is said that a dense, black gum may be obtained from the outer layers of the birch-tree bark by distillation, which possesses all the ordinary properties of gutta percha, and has the additional merit of resisting the deteriorating influences of air and the corrosive action of acids. This advantage makes it useful as an ingredient of India rubber and gutta percha, which it renders far more durable. Whether these statements are true remains to be proved.

Good Health.

Treatment of the Ear.

Delicate and highly nervous persons who are liable to suffer from shocks and are inclined to affections of the hearing, should live apart from the loud noises of railroads, factories, iron mills, etc. They should avoid with great care exposure to cold and damp, and especially should not wear thin shoes in walking on damp ground or saturated brick pavements. Children ought never to be struck on the ear with the palm of the hand, even in sport. Sudden deafness results sometimes from boxing the ears, as well as the rupture of the tympanum. Often the sudden jar or shock with the concussion of air on the ear drives in the stapes or inner bone, destroying its function and diminishing the sensibility of the nerves.

Teachers should try a child's hearing before blaming it for stupidity or inattention, as in not a few cases the fault results from imperfect hearing. Cold being one of the chief causes of deafness, care should be taken to fortify the eyetem against it. Especially is it necessary to guard against the liability to take cold, and this is best done by being much in the open air when it is clear and dry, and by the judicious use of cold or tepid water for bathing. In case of sensitive persons, water should never enter the ears under any other condition than warm or hot, to wash out some injurious substance.

Introducing into the ear the twisted corner of a towel, as some persons do, is particularly hurtful, tending to compress the wax upon the tympanum. Delicate persons should avoid draughts on the ears, sitting in wet clothes, sudden changes from the heated atmosphere of crowded rooms to cold winds, and other similar exposures. Tobacco smoke is injurious to sensitive nerves, and sometimes produces a peculiar diseased condition of the eustachian tube. Smoking in the open air should be especially avoided by persons whose hearing is impaired, as it injures the throat, and the opening between the throat and ear. No cotton or wool should be worn in the ears unless there is a perforation of the membrane of the drum. If there is itching of the ears, a little vaseline or cosmoline may be introduced on the end of the little finger, but never pushed in.

No instrument of any kind, steel pens, ear picks, pins, sharpened sticks, should be put in the ear; they irritate the delicate lining membrane, and in some instances pierce it. Sea bathing should be indulged in only with great care as to the temperature and the avoidance of water in the ears. If the person is not robust, the head should be protected in cold water bathing and diving by an oilcloth cap or other covering, or by a pledget of wool. If the ears are sensitive, they should be protected, if possible, by the natural covering of the head, the hair being allowed to grow moderately long. Frequent cutting of the hair very close is one of the causes of catarrhal inflammation of the ear. The feminine fashion of wearing the hair and hat on the back part of the head tends to neuralgia and disease of the ear, and should not be followed in cold weather.—*Dr. Turnbull.*

How Voltaire Cured the Decay of His Stomach.—In the "Memoirs of Count Segur" there is the following anecdote: "My mother, the Countess de Segur, being asked by Voltaire respecting her health, told him that the most painful feeling she had arose from the decay in her stomach and the difficulty of finding any kind of aliment that it could bear. Voltaire, by way of consolation, assured her that he was once for nearly a year in the same state, and believed to be incurable, but that nevertheless a very simple remedy had restored him. It consisted in taking no other nourishment than yolks of eggs beaten up with the flour of potatoes and water." Though this circumstance concerned so extraordinary a person as Voltaire, it is astonishing how little it is known and how rarely the remedy has been practised. Its efficacy, however, in cases of debility, cannot be questioned, and the following is the mode of preparing this valuable article of food as recommended by Sir John Sinclair: Beat up an egg in a bowl and then add six tablespoonfuls of cold water, mixing the whole well together; then add two tablespoonfuls of farina of potatoes; let it be mixed thoroughly with the liquid in the bowl; then pour in as much boiling water as will convert the whole into a jelly, and mix it well. It may be taken alone or with the addition of a little milk in case of stomachic debility or consumptive disorders. The dish is light and easily digested, extremely wholesome and nourishing. Bread or biscuit may be taken with it as the stomach gets stronger.

Spreading Diphtheria.—It is not alone by the breathing of infected air that diphtheria may be communicated from child to child at school. Indeed, those who deny that the air is often or ever a medium of communication of the disease, and who are at all familiar with the thoughtless ways of little children at school, must yet recognize that the possible means of communication by almost direct contact are many. Who has not seen a schoolboy with his mouth full of marbles taken from a mate? Children often borrow lead pencils, which by instinct they wet in their mouth; they borrow sponges from one another to wipe their slates, which they moisten with saliva. In so democratic a community as a primary school-room it is a very common thing for all the children of the room to drink from the same cup, their clothes commonly hang in close contact in closets and ante-rooms. They manifest their likes and dislikes by biting or refusing to bite from the same apple; and little girls often pledge eternal friendship by that classic symbol, "sharing gum." Though these things may occur outside the school, they are the more frequent the more children are brought together, as they are in schools.—*The Sanitarian.*

Sick Headaches.—Nine times out of ten the cause is in the fact that the stomach is not able to digest the food last introduced into it, either from its being unsuitable or excessive in quantity. A diet of bread and butter, with ripe fruits or berries, with moderate continuous exercise in the open air sufficient to keep up a gentle perspiration, will often cure it in a short time. One teaspoonful of powdered charcoal in half a glass of water, and drank, sometimes gives relief. And yet the above remedies will not avail in all cases. A sovereign remedy for this disease is not easily found. A correspondent contributes the following: Sick headache is periodical, and is the signal of distress which the stomach puts up to inform us that there is an over-alkaline condition of its fluids; that it needs a natural acid to restore the battery to its normal working condition. When the first symptoms of a headache appear, take a teaspoonful of lemon juice clear, fifteen minutes before each meal, and the same dose at bedtime. Follow this up until all the symptoms are past, taking no other remedies, and you will soon be able to go free from your unwelcome nuisance. Many will object to this, because the remedy is too simple, but I have made many cures in this way.—*Dr. Haire.*

To Remove Rusted Joints and Nuts.—Kerosene oil or naphtha, or even turpentine, will in a short time penetrate between minute crevices in joints that have been long in contact, whether bolts or nuts or steam joints. They should be ignited when possible, when the effects of heat and diffusion will soon loosen the metals. Nuts rust so tight sometimes that no wrench will remove them without breaking off the bolts. A gentle hammering on the sides and top will sometimes start them a little. A driven joint, or rust joint, between flanges, formed by cast iron borings and sal ammoniac in solution in them, can not be parted by any means short of destroying the castings. The scrap heap is the only remedy.

Passing Events.

Our "Mining Summary" chronicles several strikes, and records of quick progress in many mining camps. But winter will soon lay its icy hand on many of the camps and developments be materially retarded. It is then that the districts of California, New Mexico and Arizona become greater favorites.

What was called a dshris meeting was held here this week before the Chamber of Commerce of San Francisco. The usual statsments were made hut nothing new was evolved. A committe of five was appointed to visit ths valleys and mountains and report on the question to a general meeting of citizens. Ths Chair appointed Messrs. Hawley, Duffy, Heller, Statson and Taher, all estimable gentlemen, hut not engineers, so that their opinion will he of no especial value. This was a farmers meeting and the miners will he heard at the general meeting. The Supreme Conrt of the United States mnst decide this question and the manufacturing of public opinion, which are the principal objects of such meetings, is of no practical moment.

Election day and admission day have made this week a sort of holiday one.

The days have been filled with engrossing events. Ths whols coast was thrilled with the announcsment of an Apache massacre in Arizona, and it was feared at first that a large detachment of troops had besnent and forts demolished by the redskins. Fortunately later news makes the trouble much less serious, and there is still a chance of an Apsche disturbance in the southeast which will arrest industry and davelopment of the country, and donhtless cost many lives. It is to be hoped that snch an evil will he averted.

The prisoner at Washington, pierced with a hullst, well nigh crushed by the secondary consequences thereof, and hemmed in with heat and malaria, has at last escaped to the refreshing breezes of the seashore, and will there renew his battle with death with strongsr weapons than hefore. The ride from Washington to Long Branch was successfully made on Tuesday, and the people carried lighter hearts whsn the tidings came that no ill effects from the movement were apparent. Hope for the recovery of the President is again in the ascendant.

A Gold Excitement in Georgia.

News of recent finds of gold in the heds of the rivers of northern Georgia is creating no little excitement and attracting considerable attention from ths press. Gold hss besn mined on a small scals in Georgia for nearly a century, hut the amount extracted has besn so small in comparison with the enormous yields of ths Pacific coast that probahly three-quarters of the people of ths United States are unaware of ths fact. Now, however, .ths newspapers in ths neighborhood of the recent discoveries are much exercised, and unite in predicting a grand rush to this nearly forgottsn corner of ths country. It is hardly to hs sxpected, howsver, that California, Nsvada and Colorado will bs immediatsly dspopulated from this cause, however inspiriting ths Georgisn outlook may be.

The Stats Geologist of Georgia announces that there sre now two companiss formed for ths purposs of mining ths heds of these rivsrs. Ons company was orgsnized in Boston, Mass., with a capital of $4,000,000, snd the work is to bs done by the International Vscuum Boat Dredging Company. The process to hs employsd is thus describsd hy a local papsr:

Ths mud from the bottoms of the rivers is forced, hy atmospheric pressure, through pipes resting on ths hed of ths river, on to ths deck. About five tons of mud and sand from the river beds can he delivered on the deck in ten minutes. The process is rapid, and a large quantity of mud can be thus mined in one day."

A very glittsring picture is presented hy a correspondent of the New York *Sun*, from whose letter we quote the following extract, as showing the state of enthusiasm which has been aroused in the minds of dwellsrs in this latest El Dorado :

"The beds of the Chestatee and Chattahoochee rivers ars so rich in gold that ths vsry sands on the shore yield the precious metal.

"Many small mountain streams cross large veins of gold, and these streams, flowing into the Chestatee and Chattahoochee, havs washed this precious freight from their sources for hundreds of miles. The first hoat is being hnilt near Dahlonega, and will hsgin work the middle of September. Few Georgians have dreamed of the enormous riches hsried in the gold fields of the northern part of our State, and that in so shallow a grave that our rivers now resurrect them, and literally roll over golden sands. Largs nuggsts are found on the rock bed of the rivers, and in little dips and hollows that the water has mads. The next two months will show results that will maks the cry of gold-ssekers not 'Wsstward ho!' hut 'Georgia ho!' The dredging hoats cost frcm $6,000 to $10,000 each, and the company is having them huilt as rapidly as possihle to put on all ths gold-hearing rivers. Over 20 miles of the river above mentioned have hesn leased from persons living on their hanks at ten psr cent. of the yield. These 20 milss will he an enormous mine, as the river hanks can be worked 12 or 14 ft. desp. The dredging hoat now in conrse of constrnction is calculated to take about $1,000 worth of hullion a day from the river hed."

Extraction of Gold from Sulphurets—No.1.

[Written for the MINING AND SCIENTIFIC PRESS by C. H. AARON.]

If the gold which is frequently found associated with the diffsrsnt classes of pyritss, is, as some think, entirsly metallic, it would seem that the simplsst and most ohvious method of treatment, namely, fine grinding and amalgamation with mercury, especially when aided hy the nse of some chsmical to remove from the surface of the metal any ohstructive film, shonld be effective for the extraction of the metal. But, although the simplicity and directness of this method have indnced its frequent trial, the results have heen unsatisfactory in most, if not all cases in this country, whence it appears that, eithsr ths gold is not all metallic, or the presence of the associated pyrites has a malign inflnence on the action of mercnry, or on the gold itself. An instancs is within the knowledgs of the writer, in which nnroasted sulphurets were treated profitahly hy amalgamation with addition of a considsrable quantity of sulphurio acid to the pulp; hut, as the ore was rich and ths extraction did not go much beyond 80%, the result could hardly be considersd to afford a precedent.

It is said by thoss who have tried it, that the hest results in raw amalgamation have been got hy dry grinding, with mercury, in an arastra, but the recovery of the qnicksilver is sxtremely difficult.

The nsxt most ohvious step was to suhject the ore to an oxidizing roasting previons to amalgamation. In some cases this has answsred fairly well, as much as 80% having besn got from sulphuretscontainingahont $100 to the ton. Butthe gold in roasted pyrites is usually not in a very good condition for amalgamation, and some assistance from the nse of added chemicals is requisite. Cyanide of potassium is perhaps the most effective agent for the pnrpose, and appsars to act hy dissolving an ohstructive film from the surface of the gold. But cyanide of potassium also dissolves gold, and a question worth considering is, how far there may he danger of a loss of gold from the nse of this reagent in any considerable qnantity.

In most acid and neutral menstrua, quicksilver and iron ars both positive to gold, whence ths natural supposition might he, that ths presencs of these metals would protect the gold from ths action of ths cyanids, ss they undoubtedly would from that of chlorine, for example. But ths electric relations of metals are changed in different liquids. Thus, in ths solution of chlorids or sulphate of copper, that metal is precipitsted by lead, but in a cyanids solution, lead is precipitated by copper. Again, it is stated in some works on chemistry, that iron precipitates copper from all its solutions, hut this seems to bs an srror, as it is stated on good authority, that at least ons solution exists in which copper is positivs to iron. In like mannsr, as is shown by that indefatigahls sxperimenter, Wm. S. Key, of New Zealsnd, gold prscipitstes mercury from a cyanids solntion, so that, instead of the mercury protecting ths gold in presencs of cyanide of potassium, it is ths gold which protects the mercury, of courss at its own sxpenss, and the solution of the gold is promoted by the presencs of mercury. Iron is also negstive to gold undsr this condition.

A new method of amalgamstion of gold has latsly hssn announncsd as ths invsntion of a French chemist. It consists in ths trsatment of ths auriferous matter, with a strong solution of corrosive suhlimate, in pressuce of metallic iron. It is well known that if a piecs of gold is brought into contact with a piece of iron, even in an extremely attenuated solution of corrosive suhlimate, the gold is instantly amalgamated, and this fact is the foundation of ths proposed process. The msthod may be effective, but there are considerations which would seem to militate against it. Firstly, corrosive sublimats, which is bichloride of mercury, is expsnsive; secondly, iron alone reduces it to the metallic state, so that thsre can he no certainty that every particle of the gold will come in contact with the iron hefore the whole of the corrosive sublimate has besn decomposed; thirdly, there seems to he some danger of the formation of calomsl, and consequent flouring of ths mercury, notwithstanding ths presencs of iron.

A process recently patented in England, for the treatmsnt of ores containing copper and precious metal, consists in treating the oxidizsd ore in barrels, with metallic iron and corrosive suhlimats. The dccomposition of corrosive suhlimate hy iron, prodnces chlorids of iron, which converts oxide of coppsr into chloride of copper. The latter is reduced to mstal hy iron. Both corrosive suhlimate and chloride of copper act on the silver compounds and convsrt them iuto chloride, which is reduced to mstal hy iron and copper. Thus ultimately the whole of the copper and silver as well as the mercury, which was put in as corrosive sublimate, becoms metallic, forming a dry amalgam, to which more mercury is thsn added to facilitate the collsction.

The idea of amalgamating coppsr on this principle occurrsd to the writer ssveral years ago, see *"Testing and Working Silver Ores,"* pags 32, hut was not considered fsasihle on account of the large quantity of quicksilver required.

Where lssd ore is plentiful, auriferous pyrites may he advantageonsly treated hy smelting, after a more or less partial oxidation hy roasting. The oxide of iron formsd in ths roasting is a good desnlphurizing agent for galena, and a flux for quartz. In hlast furnacss a difficulty arises from dusting, which might be obviated by mixing the roasted pyritea with clay and water, and drying ths mixture in lumps, or hy matting the material in a rsverbsratory furnace. In a revsrheratory smelting furnace, the dusting will give little or no tronhle.

Many attempts have heen mads to extract gold by passing the pulvsrulsnt ore through a hath of melted lead or zinc, and it is not very long since a person, who has .sincs made himself notorious hy a more egregious fraud, the impudence of which approaches the snblime, sndeavored to foist this old processs upon the public as something new. In regard to metallurgical processes, as in some other cases, it may he said, "hy their fruits ye shall know them," and as this process has not prodnced any tangible fruit in the 15 or 20 years of its existence, we may safely conclude that it has not heen found practicahle.

Another method, npon which experiments have heen made, is to suhject ths pyrites to heat in clay rstorts. A portion of the sulphur is suhlimsd and may he collected in condenssrs. The pyrites are changed into magnetic pyrites, which oxidizs rapidly hy exposure to air and moisture. The treatmsnt in clay retorts is too expsnsive—a reverberatory furnace with a redncing fire might possihly answer.

The principle of the Bessemer converter has of lats years been applied to the treatment of sulphnrsted ores containing gold, silver or copper. Ths constituents of the ore itself, hy their combnstion, are; made to supply ths heat for the operation; just as the carhon does in the making of Bessemer steel from cast iron. In the high temperature of the convertsr, it is found that ths ordsr in which ths different snbstsnces burn is, iron, steel, sulphur, copper, lead, so that if the hlast of air which is hlown through the molten mass hs stopped at the right momsnt, a slag and a matte are obtained, the former containing nearly all the iron, silics, stc., and the latter containing copper, lead, gold, silver, nicksl and cobalt. Lead, antimony, arsenic aud some sulphur are collected from the flues, whsre thsy condense at different distances from the source of heat, according to their volatility. This process is one of concentration rsther than of final extraction, and is therefors somewhat out of ths lins of this article; but it has so much to commend it to attention that its mention may be excused in a paper which is intended to he suggestive rather thsn exhaustive.

Ths strong tendsnoy of chlorine to combine with gold, naturally suggested its uss for ths extraction of the precious mstal from orss. The first to make this application in a practical way, was ths illustrious Plattner, by whose name ths process, as commonly worked in this country, is appropriatsly known. It has been sttempted to form the compound of gold and chlorins hy ths aid of firs, and it csu be dons, but so great is ths tendency of the chlorides of gold to decomposs under the influencs of heat, that ths method hss nsvsr, to the writer's knowledge, heen practically successful as a metallurgicsl process, although, in a form to be refsrred to hsresfter, it is recommendsd in the assay of gold qnsrtz. Ths form of chlorination introduced hy Plattner, and modified, as to ths kind of vsssels to hs ussd, by Deetken, is thst which hss givsn the bsst rsults in tho treatmsnt of auriferous sulphursts in this country, and is extensivsly used in California, and in Colorado. In this process ths combination of chlorins with gold is effected, not by mesns of heat, but by the agsncy of water, with which ths ore is slightly moistened. In order that the combination may taks place, the snlphurets must be thoronghly oxidized by msans of roasting with exposure to air, and the solnhle metal sulphates thus formed mnst hs decomposed hy continned heat, or by msans of salt. The chloride of gold whsn found, is washsd from the ors by means of water, in which it is soluble, and the gold is precipitated from this solution usually by the addition of sulphats of iron. In some cases sulphate of iron is objectionahls; we have thsn the choice of the following reagents for the purpose, namely, sulphnretted hydrogen, oxalic acid, sulphurous acid, nitrous oxide, dichloride of copper, animal charcoal (patented), wood charcoal (said to he patsnted), sulphide of copper (patent applisd for), and a numbsr of othsr substances.

Notwithstauding that Plattnsr's process is so extensively ussd, in many casss with results which leave little to hs desired as to ths extraction of the gold, it is still opsn to objection on the score of expense, and in some casss also for inefficiscncy. Roasting of the ore is imperative in ths instance of sulphurets, and this requires considerable outlay for furnaces, as well as a constant expsnse for labor and fusl. In the ordinary procedure sulphuric acid is required for the generation of chlorine, and, although this could easily hs made from the ore itsslf, yet ths plant for so doing would require an additional heavy outlay, and the production of the acid would require a knowlsdge which is not always possessed hy the operators. As already obssrved, the sxtraction of gold is sometimes very good, the writer himself having reached 98% from ore containing about $300 per ton, but in general enough gold remains in ths ore to maks a better process quite desirable, being from $12 to $20 per ton tailings. In some cases ths presence of lead, silver, etc., greatly interferes, and although this difficulty has becn skilfully met hy Ottokar Hofmann in his patent process, yet it has been at ths cost of more handling, and, therefore, grester expense. In consequence of these dsfects, inventors have not ceased their endsavors, either to contrive an entirely nsw process, or to so improve that of Plattner as to seonre a more perfect, or a cheaper extraction of gold.

Foundry Notes.

At the Golden State and Miners' Iron Works they are just completing an immense pulley for tbe Presidio Railroad Co. It is the driving pulley for operating the grip pulleys of the wire cable, this oompany intending to uss a bslt instead of gears. The hig pulley is 24 ft. in diamstsr, and weighs ssven tons. It wa cast in halves and bolted togsther. These works now have a new laths for these kind of jobs, and they can now turn a pulley 32 ft. in diametsr. The face plate to the lathe weighs six tons. The spindle to ths facs plats, which is of steel, weighs one ton.

This foundry is also engaged in working the grip pulley, sheaves, etc., for ths Presidio cable road. Tney have jnst sent a large double hoist to Utah, and are at work on a single hoist; also completing a 20-stamp mill for an Idaho mins. Considerable supply work is also heing done for Arizona, in the shspe of shoes, dies, and other castings. Ths usual amount of miscsllaneous work is on hand.

PALISADE DISTRICT, Nevada, is a new mining district about six miles west of Palisade, and a mile and a half from the lins of the Central Pacific railroad. The ore very closely resemhlcs that of the Richmond mine at Eureka. It carries a good deal of manganese and iron. Two parties are developing claims there now, and one of the ledges is eight ft. wide. Assays made in this city this week, run from $57 up to $300 per ton. The men at work will soon prove up the value of the claims.

THE Klamath river is so uncertain lately in regard to stage of watsr and current, that much tronbls has been experienced in operating the watsr whsels in the mines.

Gold Nuggets—No. 2.

[Written for the Press by Henry G. Hanks, State Mineralogist.]

The following table of remarkable nuggets is compiled from various sources, and probably contains errors. Early pioneers of California, and miners generally, are requested to communicate with the State Mineralogist, to point out mistakes that may be noticed, and to send descriptions of those not mentioned in this list. From the information so obtained a corrected catalogue will be prepared.

Where the weight only has been published the value has been calculated on an assumed fineness of 900. Of course such a calculation is only approximative, it being impossible to know the actual fineness. Where the value only has been stated, the weight has been obtained by reversing the calculation.

The first piece of gold found in California by James W. Marshall, weighed 50 cents; and the second, $5. They were both paid out for provisions, and all trace of them lost. It is, therefore, impossible to show the first piece of gold found in the State, and it is to be hoped that we shall not soon see the last.

The discovery of the first specimen of gold remarkable for its extraordinary size, plays a prominent part in the early history of California. The official news of the discovery of gold in the State was taken to the Government by Gen. E. F. Beale. He went to Washington, bearing about $50 worth of gold dust, but failed to excite the interest he anticipated, and returned rather disgusted. During his absence, the historical mad rush to California from the ends of the earth had begun, and he found San Francisco in a wild state of excitement. He arrived late in the summer of 1848. About that time a young soldier of Stevenson's regiment, while riding along the Mokelumne river, stopped to drink from a stream, and discovered a gold nugget, weighing between 20 and 25 lbs. He hastened to San Francisco and placed his prize in the hands of Col. Mason for safety, who sent it by Gen. Beale to the Eastern States, the exhibition of which in New York fanned the smouldering flames, and the nation began to realize the importance of newly acquired California.

In November, 1854, a mass of gold was found at Carson hill, Calaveras county, which weighed 195 lbs. Troy, or 2,340 Troy ozs., the value of which, assuming the gold to be 900 fine, was $43,534. This is the largest piece of gold ever found in the State. Several other nuggets, weighing from six to seven lbs., were found at the same locality.

On the 18th of August, 1860, a large piece of gold was taken from the Monumental quartz mine, Sierra Buttes, Sierra county, which weighed 1,596 ozs. Troy, the value of which was estimated at from $21,000 to $30,000. The mine was owned by Wm. A. Farrish & Co. The nugget was sold to R. B. Woodward, of San Francisco, on the 4th of September, 1869, for $21,636.52, and placed on exhibition at Woodward's Garden, where it attracted much attention. By an unfortunate circumstance, no cast was ever made of it. It was melted and sold October 7th of the same year, yielding only $17,654.94—an example of the universal habit of overestimating the value of such specimens. The Monumental mine had yielded $70,000 worth of gold at the time of the discovery of the nugget.

Mr. Strain found a large slab-shaped gold quartz nugget near Knapp's ranch, half a mile east of Columbia, Tuolumne county, which weighed over 50 lbs. avoirdupois; it was about 14 inches long, 9 inches wide at one end, and 5 at the other. The sides were nearly parallel. When broken up, gold was separated from the quartz which was melted into a bar weighing 396 ounces, and sold for $7,500. The rock was then crushed in an iron mortar and panned out. The result was gold to the value of $1,000 more. This specimen was found in a small trail leading up the slope of the hill from the gulch, and hundreds of miners had walked over it without notice. Near the same locality others found pieces worth a few hundred dollars, but the pocket or vein from which it came was never found.

In 1855, at French Ravine, Sierra county, a nugget was found which weighed 532 ozs., and was worth $10,000. It contained considerable quartz, which is not calculated in the weight.

In the year 1867, at Pilot hill, El Dorado county, a bowlder of gold quartz was found, which sold for $8,000. The estimated weight of gold was 426 ozs. Troy.

In 1851, at French ravine, Sierra county, a gold nugget was found which weighed 426 ozs., and was valued at $8,000.

Mr. Virgin and two other miners found a nugget of gold on Gold hill, near Columbia, Tuolumne county, which weighed 360 ozs. The value of the piece was about $6,500. It was somewhat oblong in shape and worn perfectly smooth. On one side there was a deep cut as if the mass had been formed in contact with a sharp rock. The gold was bright and had the general appearance of a small meteorite. It was found two and one-half ft. below the surface, imbedded in red clay.

In 1853, a mass of gold weighing 283 ozs., and valued at $5,265, was found at Columbia, Tuolumne county. My informant saw it weighed at Mille hankiug house in Columbia.

A nugget is reported to have been found at Minnesota, Sierra county, weighing 266 ozs., and valued at $5 000. No other particulars have been obtained.

In 1850, a piece of gold quartz was found in French ravine, Sierra county, which contained 263 ozs. of gold worth $4,893.

A Frenchman found a nugget of gold in Spring gulch, near Columbia, Tuolumne county, which was nearly pure gold. It was worth more than $5,000. The mass was somewhat coated with oxide of iron when first found. It was globular in shape. The discovery of this nugget proved to be a great misfortune, for the finder became insane the following day and was sent to Stockton. The French Consul recovered the nugget or the money obtained for it, and sent it to his family in France.

A nugget, said to have been pure gold, was taken from the Middle Fork of the American river, two miles from Michigan Bluffs, in the year 1864, which weighed 226 ozs. and was sold for $4,204. Another account of this nugget states the weight to have been 187 ozs.

In 1855, at Remington Hill, Nevada county, a nugget of gold was found which sold for $3,500; the weight, estimated from the value, was 136 Troy ozs.

At Smith's Flat, Sierra county, in 1866, a piece of gold was taken from a claim which was worth $2,716 and weighed 146 ozs.

At Smith's Flat, Sierra county, in the year 1864, a nugget was found of 140 ozs. weight and worth $2,605.

No date is given in an account of a gold nugget found in a gulch near Klamath river and Groot's Ferry, Siskiyou county. Its weight is stated as 131 ozs. and its value $2,437.

A second piece of gold of unusual size was found at Remington Hill, Nevada county, in 1867, which weighed 128 ozs. and was valued at $2,400.

In 1869, a nugget was found at Little Grizzly Diggings, Sierra county, which weighed 107 ozs. and was worth $2,000.

A cluster of beautiful dendritic crystals of gold was found in August, 1865, in the Grit claim, Spanish dry diggings, El Dorado county, which weighed 101.40 ozs. Troy, the value of which was $3,500. It was taken from a tunnel 200 ft. below the surface. It was sold and sent to New York, where a French gentleman, Mr. Fricot, formerly of Grass Valley, bought it, and by him it was taken to Paris. In all probability it now graces some foreign museum. It should have been preserved in our own. A fine photograph of this beautiful specimen has been presented by Mr. Arthur M. Hickox to the State museum, where it may be seen by those interested.

A nugget of gold weighing 94 ozs. was found in the Hope claim, four miles below the Mountain House, Sierra county, valued at $1,770, the name of the finder and the date are not given.

In 1854 a gold nugget was found by Frank Russworm, in a claim 2 miles south of Campo Seco, Calaveras county, at the head of Stone Cabin gulch, on the bedrock, 20 ft. from the surface. Weight 93 ozs., value $1,760. It was sent to the mint soon after being found.

In 1860, at French Ravine, Sierra county, a nugget worth $1,757, and weighing 93 ozs. was found.

In 1861, at Smith's Flat, Sierra county, a gold nugget was found, which weighed 80 ozs., and was valued at $1,509.

At Lowell Hill, Nevada county, in 1865, a 53 oz. nugget worth $1,100 was found.

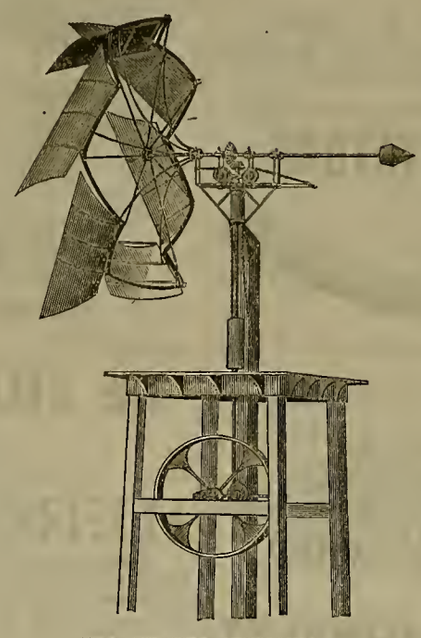
There is a model of a gold nugget in the State Museum from Oregon canyon, El Dorado county. Mr. Caleb T. Fay of San Francisco, thinks this nugget is one that he bought in 1850 for $1,250 and sent to Boston, where it was placed on exhibition in the counting room of Dexter, Fay & Co. Mr. Fay will write to Boston to learn if a coast was made of it at the time. The nugget was found by Alonzo Kinsley.

A beautiful nugget of crystallized gold was exhibited at the Paris exposition of 1878, in the Pacific coast collection, which attracted much attention. It weighed 13 ounces. Its intrinsic worth was $248; but as a beautiful mineralogical specimen, it was far more valuable. It was from the Banghart mine, Mad Mule canyon, Shasta county, and was exhibited by Samuel Cooper.

What are known as pocket ledges are common in California. By this may be understood quartz veins, in which rich spots occur, and from which large amounts of gold are sometimes taken from a comparatively small space. No calculation can be made as to the extent of these pockets, or as to the reasonable expectation of finding another when one is exhausted. A remarkable deposit of this nature has lately been developed in the Rainbow mine, Sierra county. A fine specimen has been on exhibition at the office of H. H. Noble, in San Francisco. It was a slab of gold quartz, which was calculated to contain $20,468. It was taken from a depth of 200 ft. The whole shipment from the pocket has been 1,953 lbs., and the total yield at the time of writing, $116,337.

From 1854 to 1862, 12 gold nuggets ranging from 30 to 170 ozs. were taken from the Live Yankee claim at Forrest City, Sierra county.

From 1856 to 1862, a number of gold nuggets varying from 30 to 100 ozs. were found in the Oregon claim at Forrest City, Sierra county.



THE BEAVER WINDMILL.

In Holden's Garden, in Sonora, Tuolumne county, in the year 1850, a mass of quartz and gold containing $30,000 worth of gold was found.

A New Windmill.

Joseph H. Therein, of this city, has recently patented through the Mining and Scientific Press Patent Agency, and exhibits at the Mechanics' Institute Fair, an improvement on windmills, which we illustrate on this page. It consists of a novel exterior rim for the wheel, to which the vanes are attached and hinged, the rim being made in zig zag sections, and having the arms or spokes of the wheel extending from the hub to the angles of these sections, so that they stand alternatively forward and backward from a plane and thus brace the rim.

The vanes are also formed in a novel way, being curved similar to a plow share, and are hinged to the angular joint, so as to stand diagonally with the plane of the wheel and they may be adjusted to the strength of the wind by means of arms connected with a sleeve sliding upon a shaft. Mr. Therein also devised a peculiar socket by which the mill may be mounted on a single post; this socket having a vertical spindle upon which the wheel axle and upper part of the mill is mounted to swing about as the wind may make it necessary.

The engraving shows very clearly the construction of the mill, the fans of which are metal. The whole mill in fact is of iron, either painted or galvanized. A weight acts on a governor and may be proportioned to get more or less speed. The weight closes the vanes toward the center and when the force of the wind overcomes the weight it forces the vanes outward and reduces the power and speed of the wheel. This mill is called the Beaver Windmill. For the large-sized wheels cloth will be used instead of metal. An 8-ft. wheel will give one horse power, and costs $75; 10½-ft. wheel, two horse power; 12-ft., three horse power; 15-ft., five horse power. The inventor's address is corner 30th and Mission Sts. The inventor informs us that the mills he has built, and which are in practical operation, are in every way satisfactory.

Success of the Mechanics' Fair.

The sixteenth industrial exhibition of the Mechanics' Institute, which closes this week, has been eminently successful from every point of view. As a business proposition the financial result has been all that was expected. The attendance was greater than last year, and the visitors have apparently appreciated the efforts of the management to please them.

As an exponent of our industrial progress the exhibition may also be considered a success. This was evidenced by the great variety of articles exhibited as shown in the catalogue published in the Mining and Scientific Press last week. To those who have never given the subject thought, few would believe that such a variety of products were manufactured here. San Francisco is, of course, the industrial center of the coast, as it is the financial center, and most of the industrial and manufacturing establishments are here; but other towns are also coming to the front in special branches, and have showed their products at this fair.

It is the manifest intention of the managers of these exhibitions to make them popular in every way, and the music and the pictures, candy stands, soda fountains, restaurants, etc., etc., all do their share. But there is a strong practical undertone and abundant evidence that it is to our industrial progress that the fair is principally devoted. The manufactured articles and substances, natural products, machinery, etc., etc., take prominent places, and, in fact, are the features of the fair.

Many, of course, visit the place to whom such things are of little interest, but most of the visitors come away impressed with the feeling that they have been in some way instructed; that they have, unconsciously perhaps, absorbed a certain amount of information which has done them good. Those, who only knew of the ordinary 10-stamp mill have seen a dozen other ways of grinding quartz; those who knew only of the pan and rocker, have seen other ways of saving gold. People who imagined their house fully furnished, came across dozens of useful things they never heard of before. The anxious housekeeper has seen varieties of stoves and household implements and handy little things for every day use that she might never have ever heard of unless she had visited the fair; and so in everything.

Altogether, these industrial exhibitions are good for us in every way. They are good for the exhibitors, too. In the first place, they get the very best kind of advertising. They show their goods in holiday dress to the people who are to buy said goods. Then rival manufacturers see the defects of their own in the superior points of excellence of others, and find they, too, must improve to keep pace with the march of events.

The great public, for whom all this display is made, by frequent visits, get interested in one thing and another, and make a point of studying up those things which they find interests them. It is impossible to spend many hours in such a place and not learn a good deal which will at some time or other be useful to one. And, moreover, the attention of inventors is often called to needed improvements in certain branches of mechanics. Some shrewd people of inventive turn of mind can see a means of overcoming a difficulty when their attention is called to it, which, perhaps, would never occur to men who have run too much in one groove.

Thus, all are benefitted in benefitting the library. The gentlemen who conduct these exhibitions are public spirited citizens, who do not get the credit they really deserve. They get no compensation whatever in any way. They give a great deal of valuable time to arranging the details and perfecting the exhibition. People have become so accustomed to having this done for them that they do not appreciate the efforts it takes to have such an exhibition. It is not a State institution. It gets no subsidies. No State board of managers provide for it. Yet this annual fair has now become recognized as the best we have on the coast. And it is mainly due to the disinterestedness of the managers. There are only the bare expenses to be paid, with no sinecures to load it down. The funds are turned over to increase the library of the Mechanics' Institute.

We are glad to be able to record the success of this fair. It is the last which will be held in the old building. Next time there will be a better place for it in every way. The Board of Managers will prepare and publish for public distribution, a full report of all matters connected with the fair. Exhibitors have been requested to forward to the Secretary, J. H. Culver, such written or printed matter as will explain the exhibits. It is to be hoped this will be done, as the report is a valuable one for reference.

Speaking of the Beveridge district, the Inyo *Independent* of August 27th says: The Keynot mine continues to produce astonishingly rich gold ore. Taylor & McEvoy's 5-stamp mill made a practical clean-up during the past week, after an eight days' run, and obtained $10,000 in gold bullion as a result. The Keynot is proving to be a first-class mine, it having already produced about $75,000, with a comparatively small extent of development.

The Florence *Enterprise* says the Leroy mine, at Mineral Hill, has been bonded to San Francisco parties for $75,000.

THE O'HARRA
CHLORIDIZING FURNACE.

Patented in 1878.

SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

—o—

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1.10 per ton to work 40 tons in 24 hours.

At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61½.

Lewis Chalmers, of the Isabella G. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenual sulphurate of silver up to from 84% to 95% of the assay.

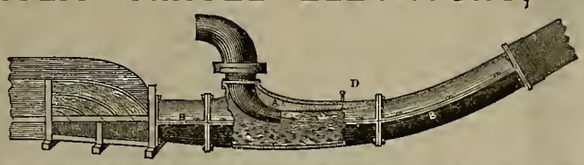
SEND FOR DESCRIPTIVE CIRCULAR TO

WHITNEY, VEASEY & CO.,

Carson City, Nevada.

Agents for San Francisco, KUSTEL & CO., 318 Pine Street.

HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY.

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co., S. F.

Excelsior Blasting Powder,

—MANUFACTURED BY—

THE EXCELSIOR POWDER COMPANY.

—o—

This is no NEW PATENT NON-EXPLOSIVE SAFETY POWDER, but the GENUINE STANDARD ARTICLE, and as safe to use and handle as any Nitro-Glycerine Powder manufactured. The Fumes and Gases, common in other Nitro-Glycerine Powders, are almost destroyed, and do not leave the miner with headache or nausea. Among the numerous recent testimonials the following is but a fair sample, constantly received, attesting the superiority of EXCELSIOR POWDER:

AUBURN, Cal., May 26, 1881.—EXCELSIOR POWDER CO.: I send you, per Wells, Fargo & Co., a box containing samples of country rock through which I am running our tunnel on the Conrad Mine, and through which we have now run 425 feet, 2/5 feet of it having been done with EXOELSIOR POWDER. If any one can produce harder rock I would like to see it. I here say that I can do more execution with your No. 2 Powder in this rock than I can with any No. 1 Powder of any manufacture I have ever used, and I have used every kind now manufactured here, excepting "Tonite," and I have had 20 years' experience in blasting. Respectfully yours,

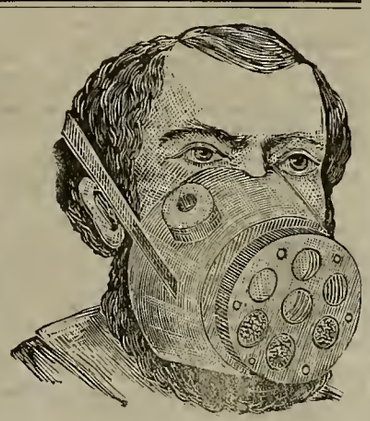
E. W. ROBERTS, Superintendent.

Give this Powder a trial and you will use no other. For Strength and freedom from noxious fumes, it has no equal. Address all orders to EXCELSIOR POWDER CO., No. 330 Pine Street, Rooms 53 and 54, Academy Building, San Francisco, Cal.

PATENT

LIFE-SAVING RESPIRATOR

Prevents Lead Poisoning and Salivation.



INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

SECURE PATENTS

Through Dewey & Co.'s **Scientific Press** Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade.

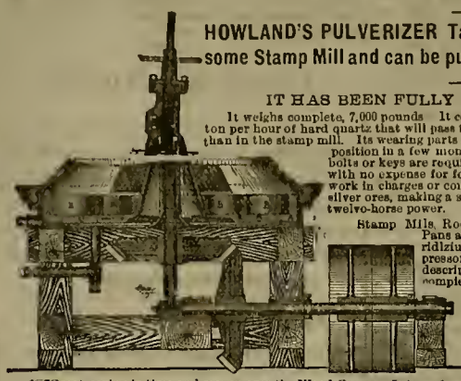
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

MOREY & SPERRY.
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery


HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.
IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies. Iron Work complete for Wood Frames, also
SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.
☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.
MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

PATENT DETACHABLE TOOTH SAWS,
Manufactory, 17 & 19 Fremont St., S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

FEED WATER HEATER AND CONDENSER FOR STEAM BOILER.—Reese Lewellyn, S. F., assignor to Lewellyn Steam Condenser Manufacturing Co. Dated, Aug. 16, 1881. No. (reissue) 9,340. The invention relatee to an apparatue for freeing water fed to steam hoilere from earthy matters held in solution therein—such ae carbonate and sulphate of lime, magnesia, and the like—and for ntilizing at the eame time the otherwise waete-heat of the exhaust steam. It conciets firet and essentially of a chamber provided with a maes of loose stonee, prohably oobble-etones, supported in said chamber in such a manner ae to prevent the free passage of water and etcam through and among all the stones, witb a pipe in the upper part of eaid chamber, adapted to snpply the water in a uniformly diffnsed state over the entire mass of etones, adapted to diffnse in like manner the steam upon the lower enrface and cause it to pase up through tbe mase, whereby the ealts and other matters—euch as carbonate and sulphate of lime and magnesia and silica held in solution and producing scale in the hoiler—are precipitated upon the etones and the heat of the eteam utilized. It coneists in the second place, in injecting tbe steam horizontally into the lower part of the chamber underneath the etone, wherehy it is more uniformly diffueed, hrought into immediate contact with and caused to penetrate every part of the mase of stones and approximately to heat all parts alike. It coneists thirdly, in placing among the etones a layer of filtering material, thereby comhining a precipitating and filtering apparatus in one chamher.

BROOM.—Geo. Hall, Santa Rosa. Dated August 30, 1881. No. 246,500. In that class of brooms in which the handle projects from the broomhead in a line with the length of the hroometraws, the angle at which the handle is held in eweeping brings only one corner of the hrush portion of the hroom into action, so that the corners of the broom eoon hecome distorted and unevenly worn, and the broom ie rendered unfit for use. The object of the invention is to adapt thie clase of brooms to the eweeping position hy arranging the hrush or sweeping end so that it will hear uniformly upon the floor along its whole length at the eame time that the broom handle is held in the usual nosition. To do thie, Mr. Hall counteracts the angular position of the handle hy giving to the brueh or sweeping edge a corresponding angle.

INSECT-PROOF CLOSET AND SAFE.—Chas. H. Larrahee, Napa. Dated Auguet 30, 1881. No. 246,397. Tbis invention relatee to an improvement in cloeets, meat eafee, or other eimilar devicee, wherehy they may he kept from ante and other insects, and also thoroughly ventilated whenever neceesary. It coneists of a closet or safe, in comhination with a eupplemental hollow baee which is adapted to contain water, the main closet being rigidly attaohed to the hase hy means of pillars or supports which stand upon the bottom of the concave haee, so that the whole forms one structure, while the outer walle of the cloeet extend downward aronnd the base without touching it, wherehy the tank is concealed from view. The hottom, shelves and top are perforated, to allow a circnlation of air and ventilation, and a hinged cover ie fitted to close the top entirely when desired.

DREDGING MACHINE.—H. B. Augell, S. F. Dated Aug. 30, 1881. No. 246,362. This invention relates to the class of dredging machines, and more especially to certain improvements thereon, consisting in peculiarly conetructed irone or nose piecee for receiving and strengthening the ladder timhers, the said timhers having baile attached thereto at certain intervals, provided with pulleye, over which pasees the chain oonnected with the gipey or windlase. A peculiar hopper is connected with the elbow of the discharge pipe by a swivel joint; said elhow being supported on a pivot pin on a step helow, while the pipe is supported on a turn-table, and has a door or opening for the purpose of introducing water to clean it. The object of these improvements is to ohviate certain difficulties to each part particularly.

CART.—DeWitt C. Putnam, Petaluma. Dated Aug. 30th, 1881. No. 246,555. This invention relates to that class of carts known ae hreaking carts and ie an improvement on one invented hy the samo patentee eome time eince. The object of this invention is to provide a cart which shall emhody lightness and strength and a convenient mode of access, theee objecte being accomplished by certain attachments which eupport a foothoard in front, as in the former invention, and by the further improvement of eaid attachments and appropriate construction thereof, the inventor providee a meane of supporting a suitahle step hehind, wherehy the vehicle ie adapted to be entered from the rear and may afford convenient accese.

NEW life is heing inetilled into many of the old mining camps in Utah which contain vast quantities of low grade smelting ore. The jump in lead ie doing tbe old camps proud.

Models and Records of Inventions.

The collections of models exhibited hy Dewey & Co., at their staud in the Mechanics' Fair pavilion, is only indicative of the Patent Office hranch of their bueiness. It by no meane represents eitber a variety or number of patented articles, and in fact not one hundredth part of the really ingenious models of anticipated inventione hrought to their office during the past few yeare.

Most of theee inventions were patented hy others before their (secondary) discovery hy the inventors of these models. By bringing them to Dewey & Co, an experienced and well posted patent eoliciting firm, they were promptly informed of their previous discovery, and eaved the expense, time and anxiety of finding out by applying for a patent and being rejected. In many inetancee Dewey & Co. are ahle to show almoet instantly the exact deecription and drawing of such inventions printed in their patent library. On the other hand, if many of the applications had heen made to less experienced or lese conecientions agents, the inventors wonld prohahly have heen innocently or intentionally led to apply for patents and have met with vexation, delay, neelees expense and final rejection.

However, the great merit of a patent agency does not lie in its collection of models hy any means, hut rather in its archives. In the patent office of Dewey & Co., there are etored the original records of Pacific Coaet inventions for years and years hack. The original specifications and reference lettere relating to nearly all the prominent patentee ever taken out on this coast, are in this office, duly claesified, indexed and arranged ready for reference. Having prosecnted these original cases before the United States Patent Office, Dewey & Co. are familiar with all that has ever heen done before, and can advise clionts of prior inventions and often save them the expenee of a frnitless application.

In each of the claeeified and indexed envelopes containing the original specifications and papers, aro also recorded the views aud opinions of the patent offioe examiners, with reference to the respective inventions. Theee indicate all inventions previously patented, of like charaoter. Theee records are therefore invalnahle as showing what has been done hy others in the eame line. It is the posseeeion of euch archivee that partly accounts for the long-continued and marked succese of Dewey & Co. in proeecuting cases hefore the Patent Office, since, instead of hlindly groping in the dark, they are enahled intelligently to judge of the merits of a case before they submit it, thne eaving hoth time and money to the inventor.

News in Brief.

DELMONICO, the famons New York caterer, is dead.

THE *Free Press* calle for an ice factory at Ynma.

THE distnrbancee in Tnnis are constantly increaeing.

SOLANO county has 500,344 acres, asseeeed at $6,156,720.

THE public echools of Jersey City are closed on account of the intenee heat.

AT preeent there are about 126 prieoners confined in the Nevada State Prison.

GATHERING wild plume is one of the occupatione of picnickers in Sierra connty.

FOUR heare were killed at Webber Lake last week. The higgest weighed 400 lbs.

BEES and hirde are rnining tbe early grape crop in perts of Los Angelee connty.

THE Miners' Union is about to erect a hall in Butte, Montana, at a oost of about $8,000.

A PLENTIFUL rain has fallon in Mysore, India, and the harvest prospects are mnch improved.

AT Tnckee, rohine are rated as game hirds; at Virginia City doves are in the eame category.

THE 30 milee of water ditches at Cedar creek, Placer county, are heing inepected and enlarged.

THE Chineee denizens of Stockton are hnilding a new Joes honee whioh will cost $10,000.

IT is estimated that the wheat product of Minnesota this year will amonnt to 33,771,511 hnshele.

NOTHING important has yet heen discovered in regard to the attempted train rohhery in Placer county.

ENERGETIC movements are heing made hy the German government against the Anti-Jewish ontrages.

IT is said that 35 familiee from the Oneida commnity of New York have purchased lande near Santa Ana.

SHERMAN & Reynolds, St. Johns, Colnsa Co., have thrashed 42,000 eaoks of wheat from their rented lande thie year.

A WOMAN rode 10 milee at Council Blnffs, Ia., Saturday, in 21 minutes and 49 seconds—the faeteet time on record.

THE reported massacre of Carr's command in Arizona turne out to he not true, that officer so reporting at headqnarters.

THE 100th anniversary of the fonnding of the Pueblo de los Angeles wae celebrated at Loe Angelee in grand style.

THERE are 17 tax-payers in San Joaquin aseeseed at over $100,000, and 15 aeeeesed at hetween $50,000 and $100,000.

PLACER connty containe 330,298 aores of land of a total aseessed value of $4,238,038. Total value of all property is $8,887,921.

IT ie reported that the North Pacifio Coast railroad has been eold, and that its new owners are to make extensive improvements.

FLOWING wells of good, soft water are heing etruck at various pointe in the town of Santa Barhara, at a depth of from 45 to 72 feet.

THE drouth continnes in certain eections of the South, and in Virginia and North Carolina great damage to the crops has heen sustained.

THE new town of Garfield is located 16 miles northeaet of Colfax, W. T., and 8 miles southwest of Farmington, on a beautifnl plot of rich, level land.

IT is said there ie a band of from 100 to 150 antelopes on the north eide of Kern river, and that they come within eight or ten milee of Bakersfield.

THE grain receipte at New York hy rail are 5,000,000 hnshels more thie year than last, though the total receipts hy rail and water are ahont 7,300,000 lees.

VANDALS have destroyed most of the gnideboards in the Yellowst one National Park, and the Montana papers ask to have new and more enhstantial signs erected.

Traveling Agents.

We want eeveral canvaseing agente who will make it their bueineee to solicit subscriptione and advertising for our first-clase progreseive newepapers. Men of ability and experience can secure good pay and permanent employment. Send references and state your past occupation, eto., to tbe publishers of this paper.

Suburban Residences in Oakland.

In our travels throughout the length and hreadth of this State, we bave often noticed tbe remarkable number of the people with whom we have come in contact who express a desiro to be able at some not distant day to purchase a home in Oakland—tbe city of schools, of delightful residences, of constantly enjoyable climate, avoiding the extremes of heat and cold so often met with in other portions of this State, and especially to be selected for a choice spot for a home from its proximity to the great business city of San Francisco, while it avoids its fierce winds, its ocean fog, and its great noise and turmoil.

Remembering theso desires of our numerous readers throughout the State, we think we cannot render them a better service than by calling their special attention to one of the very finest pieces of property for

Suburban Residences

We have ever seen offered on this coast. It has an altitude of about 100 ft. above tide-water; the breezes which blow directly off the bay of San Francisco come laden with health and enjoyment, while the ever-delightful views of hay and mountain side, city and valley, are a source of continual pleasure.

From the elevated portions of this property, the eye takes in at a glance the beautiful city of Oakland—a nest of homes embowered in trees and flowers; the distant city of San Francisco, which looms up as the great mart of commerce, with its wharves and shipping, its numerous steamboats and ocean steamers; the beautiful bay; the Golden Gate with its open portals welcoming the ships and the people of the whole world; the islands dotting the bay; the long lines of steam cars continually coming and going crowded with passengers; the beautiful homes in the valleys and on the hill-sides, and the spurs of the coast range of mountains for a quiet background to the picture. In all these scenes can he found a source of pure enjoyment of which one can never tire, and of which the owners can never be deprived.

This property is well named "Oakland Hights," and it is destined to be one of the very choicest of all the delightful residence sites of this city of homes.

Who would not like to have his home in such a place, within 15 minutes' drive of the center of Oakland, within an hour of the great city of San Francisco, in a climate so genial that the orange and the fig will flourish, in a city noted for its public and its private schools, with the State University almost within sight, with Lake Merritt, one of the most beautiful sheets of water on the coast, immediately adjacent, furnishing splendid facilities for rowing and sailing, with beautiful drives by winding roads not only through this tract but stretching away for miles in every direction, constantly opening up new scenes and distant views which furnish ever constant sources of delight.

Every facility will be offered for obtaining pure water, the gas pipes from the city of Oakland will be extended through the tract, and the arrangements for sewerage will be perfect. And when we come to examine this property in a pecuniary point of view, either as to the prices now asked for the lots in it, or as to their prospective value as an investment, these considerations greatly add to its desirability.

The prices now asked are not only extremely low, but if a purchaser erects his home within a reasonable time, a large rebate in coin is given to him; while as to the future, when Oakland becomes the large business city, which it is sure in time to do, this tract will be the more eagerly sought after for the residences of its wealthy citizens.

Whoever of our interior friends are thinking of Oakland as their future home, and as the place to enjoy life and to educate their children, should by all means make an early visit to this tract, and secure a home site while the present great advantages in choice of lots, in price and rebate are offered.

The Oakland agents are the well-known real estate firm of A. L. Gladding & Co., 483 Ninth St., from whom maps, circulars, and all information concerning this property can be obtained free on application, by mail or otherwise.

The 16th Industrial Exhibition.

OF THE

MECHANICS' INSTITUTE.

OF SAN FRANCISCO,

Opened Tuesday, August 2, 1881

Board of Managers.

P. B. CORNWALL, Pres't, J. A. BAUER, Treasurer, RICHARD GRAY, C. WATERHOUSE, JAMES DRURY, A. R. WELLS, JAMES SPIERS, J. H. COLVER, Sec'y, A. W. STARBIRD, Vice Pres't, DAVID KERR, SAMUEL DINSMORE, J. R. WILCOX, GEO. H. HOPPS, EDWIN FRETWELL, GEO. SPAULDING, J. H. GILMORE, Sup't.

Committees.

AUDITING.—Waterhouse, Kerr, Gray.
BUILDING.—Drury, Wells, Wilcox.
CIRCULARS AND CLASSIFICATION. — Fretwell, Hopps, Spiers.
PRINTING AND ADVERTISING.—Spaulding, Fretwell, Gray
POWER AND MACHINERY.—Spiers, Dinsmore, Wilcox.
RULES, REGULATIONS AND AWARDS.—Dinsmore, Spiers, Bauer.
TICKETS AND ADMISSIONS.—Wells, Kerr, Fretwell.
MUSIC AND DECORATIONS.—Bauer, Starbird, Hopps.
PRIVILEGES.—Kerr, Starbird, Waterhouse.
LOCATION.—Starbird, Spaulding, Drury.
POLICE.—Gray, Drury, Spaulding.
HORTICULTURE.—Hopps, Waterhouse, Bauer.
GAS AND WATER.—Wilcox, Wells, Dinsmore.
ART.—Hopps, Bauer, Gray.

Official Employees.

ENGINEER (Machinery Department).—J. G. Holmes.
GAS INSPECTOR.—S. N. Gruhh.
CAPTAIN DAY WATCH.—T. S. Tweedale.
CAPTAIN NIGHT WATCH.—H. L. Barker.

Our Agents.

OUR FRIENDS can do much in aid of our papor and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. MCGREW—Santa Clara county.
M. P. OWEN- Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Yuha and Sutter counties.
D. W. KELLEHER—San Matoo and Santa Clara counties.
C. E. WETMORE—Alameda county.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F.D., at this office.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We will send it, on trial, at the rate of $4 per annum for any period the reador may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accesions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

$40 RIFLE FOR ONLY $15.—The Evans 26-shot Sporting Rifle, advertised by E. G. Rideout & Co, 10 Barclay street, is a great bargain We are positively assured that the retail price of theso Rifles was $40 each; any one can get the same Rifle now hy sending to the above named firm only $15. They offer to refund the money sent if the Rifle is not as roprcsented. Read their large advertisement in this issue.

BOUND VOLUMES OF THE PRESS.—We have a few sets o the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and eather binding, $5. Tbeso volumes, complete, are scarce and valuable for future reference and library use.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

ANNUAL STATISTICIAN of 1881.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 816 California st. Price, $4.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Consolidated Virginia Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given that, at a meeting of the Board of Trustees, held on the twenty-second (22d) day of August, 1881, an assessment, (No. 16) of Thirty (30) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, 309 Montgomery street, Room 26 (Nevada Block), San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth (24th) day of September, 1881, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on Saturday, the twenty-second (22d) day of October, 1881, at the hour of eleven (11) o'clock A. M., at the office of the Company, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. W. HAVENS, Sec'y.

OFFICE—Room 26, No. 309 Montgomery street (Nevada Block), San Francisco, Cal.

The Oxford Beta Tunnel and Mining Company.

Location of principal place of business, San Francisco, Cal. Location of works, Aurora, Esmeralda County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the Twentieth (20) day of August, 1881, an assessment, No Twenty-nine (29), of Twenty (20) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Rooms of Dr. Knowles, 118 Dupont street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the Twenty-sixth (26) day of September, 1881, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the Seventeenth day of October, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

GEO. H. PEOK, Sec'y.

Office—Rooms of Dr. Knowles, 118 Dupont street, San Francisco, Cal.

Scientific, Mining and Other Valuable Books.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL.

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, $7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, appliances and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

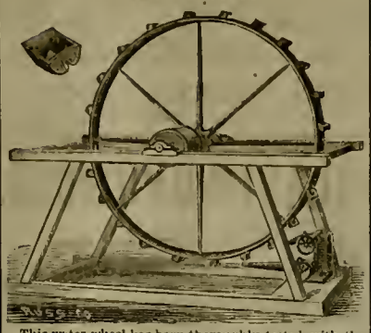
Price, $3.00 coin, postage free.

California Inventors

Should consult DEWEY & CO., AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1850. Their long experience as journalists and large practice as patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 202 Sansome St., San Francisco.

THE PELTON WATER WHEEL.

(Patented, Oct. 26, 1880.)



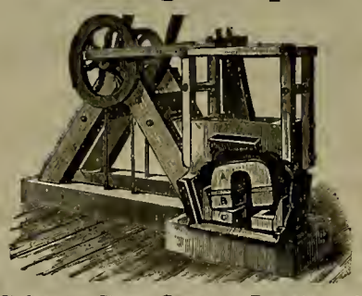
This water wheel has been thoroughly tested with the Dynamometer, and utilizes 73% of the theoretical power; and underheads of water of 75 to 300 ft is guaranteed to give better satisfaction than any Turbine or other wheel ever offered to the public. The above per cent. is due to the peculiar shape of the buckets used. They do not reduce the water to a spray, but divide and deflect it outward and backward, in such a manner that a part of the impact and the whole reactionary force are utilized, without any part of the water coming in contact with the bucket following. Furthermore, the per cent. of efficiency remains constant through great variations in the amount of water used. These buckets can be taken off in transportation, and can be replaced by new ones when worn out by sand in the water; also can be applied to wooden wheels when desired.

SEND FOR CIRCULAR.

Orders can be filled at short notice by addressing the undersigned,

L. A. PELTON,
Camptonville, Yuba Co., Cal.

HUNTINGTON'S Oscillating Stamp Mill



It has no Steme, Came, or Tappete, and Adjusts Itself to the Wear of the Shoes and Dies.

For Simplicity, Economy, Durability and Effective Working, it exceeds anything ever presented to the public, and will do the work of five stamps with one-fourth the power.

Awarded First Premium and Medal at Mechanics' Fair, San Francisco, 1880.

MANUFACTURED BY

F. A. HUNTINGTON, 220 Fremont Street., S. F. California. | FRASER & CHALMERS, 145 Fulton Street, Chicago, Illinois.

San Francisco Pioneer Screen Works
J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.
32 Fremont Street, San Francisco.

WE ARE SOLE AGENTS FOR THE GENUINE
ALBANY COMPOUND, CYLINDER AND SPINDLE OILS.
All others are Counterfeit.

TATUM & BOWEN
CYLINDER AND COMPOUND OILS
12 CALIFORNIA ST.
Lubricating and Lard Oils.

1851. 1881.
DEPUTY U. S. MINERAL SURVEYOR.
Surveys for Location or Patent. Maps and Plans Drawn. Mining Properties of all kinds examined and careful reports made of the same. Consultations on Mining Investments. Address, THOS. W. REECE, CIVIL ENGINEER, Oroville, Butte Co., Cal. References given and required.

PACIFIC MACHINERY DEPOT.

The Korting's Injector is the simplest, cheapest and best in use. Will draft its own water, hot or cold, and feed under varying pressure. Send for Circular.

H. P. GREGORY & CO.,

Importers and Dealers in Machinery and Supplies.

Nos. 2 and 4 California Street, S. F.

BLAKE STEAM PUMP.
More Than 16,000 in Use.

SOLE AGENTS FOR.

Fay & Co., Wood Working Machinery.
Bement & Son's Machinists' Tools.
Blake's Steam Pumps.
Perry's Centrifugal Pumps.

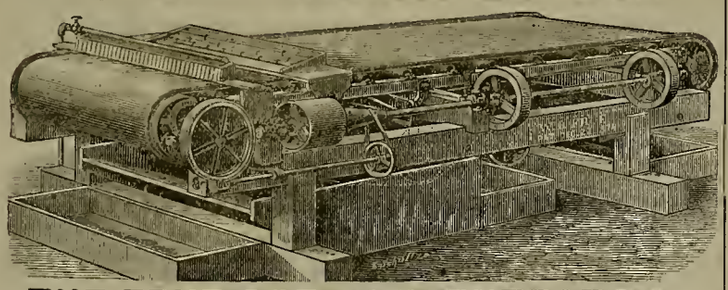
STEAM ENGINES, BOILERS, STAMP MILLS, FRUE VANNERS
and Machinery for Systematic
Mining, Milling, Smelting and Concentration of Ores
No. 145 Fulton St., CHICAGO, ILL.

Howell's Improved White Roasting Cylinders.
REVOLVING CYLINDERS AND ORE DRYERS.
Hoisting and Pumping Machinery.

$1,000 CHALLENCE!



THE FRUE ORE CONCENTRATOR.

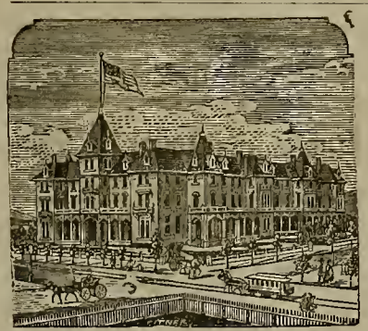
Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.

Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.

We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.

☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.



TUBBS HOTEL,

East Oakland,

Having been Thoroughly Refitted and Refurnished, Painted and Frescoed, is now Open for the Reception of Guests. Rooms can now be secured at the Hotel.

S. I. KELLOGG, PROPRIETOR.

"FRUE" ORE CONCENTRATORS.

I have on hand and for sale, at LOW PRICES, a number of the above Concentrators, of the latest pattern and in perfect order.

JOSHUA HENDY,
Manufacturer of Quartz and Saw Mill Machinery

AGENT FOR "BAKER'S" ROTARY PRESSURE BLOWERS,

Hot Polished Shafting from the Akron Iron Company, Ohio. Also, "P. Blaisdell & Co.'s" Machinists' Tools. A Large Stock of New and Second hand Machinery at Machine Works.

Nos. 49 and 51 Fremont Street, San Francisco.

GOLD MINERS

WORKING PLACER, GRAVEL AND QUARTZ MINES,

SAVE YOUR GOLD!

—BY USING—

SILVER PLATED AMALGAMATING PLATES.

The most economical and successful process now in use. Will warrant my Plates to save a very much larger percentage of gold than any other method.

SWING AND RIFFLE PLATES for Saving Float Gold Made to Order.

OLD MINING PLATES BOUGHT, TAKEN IN EXCHANGE FOR NEW, OR RE-PLATED.

ALL KINDS OF METAL GOODS PLATED!

San Francisco Gold, Silver and Nickel Plating Works,

653 and 655 Mission St., bet. New Montgomery and Third, San Francisco.

TONITE.

Miners! Attention!

With the approach of winter, the dangers which attend the handling and use of all Giant Powders (Nitro-Glycerine mixtures) are increased.

The lives annually sacrificed in thawing or using frozen cartridges, should be a warning to all to abandon Powders which freeze at 42° Fahrenheit. All Nitro-Glycerine Powders freeze at that temperature, and now for the first time Miners on this Coast have an opportunity to AVOID THESE DANGERS.

TONITE NEVER FREEZES!

NOR IS THERE ANY LIQUID SUBSTANCE IN IT TO LEAK OUT.

It is Always Ready for Use, as well in the Coldest Regions as the Tropics.

☞ Miners are cautioned to take no stock in the slanderous reports about TONITE circulated anonymously or otherwise by the Giant Powder Company. They are all untrue.

TONITE POWDER COMPANY,
218 California street, S. F.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞ Triple Force Cape and all Grades of Fuse.

SAN FRANCISCO, SATURDAY, SEPTEMBER 17, 1881.

VOLUME XLIII Number 12

The Panama Canal.

We give on this page a panoramic view of the Panama canal as planned by M. De Lesseps. The general principles of the plan are now so well known as to need no detailed description, and the engraving will give a much better idea than columns of figures would. It shows the course and the relative positions of the rivers. It also shows the location of the big dam which is to turn the Chagres river.

A great deal of preliminary work is now being done at the canal in the way of surveying, boring, etc. They are also studying a way to dispense with a lock at Panama. The high tide at Panama is 32 ft., and on the Atlantic side it is only 1 ft. 6 inches. The problem presented by these differences is now being studied. They think the current will be very small, and that it will present no difficulties to be overcome.

These facts we gain from Mr. Prosper Huerne, an architect of this city, who has just returned from Panama, where he remained several months, superintending the construction of buildings in one of the villages on the line. There will be 15 or 16 of these villages on the line. The first one Mr. Huerne laid out at Gahun, and at the next station to that place. All the material for the building was procured in this city and shipped down there ready to be put together. The mill work, etc., was all done here. Mr. Huerne took about 40 American carpenters with him. Another village station will soon be established. Each village has for buildings, a large shed, store houses, lodging houses, an engineers' cottage, hospital, workmen's kitchen, dining rooms, foreman's lodgings, bakery, water tank, ice house, etc. The villages are arranged precisely alike. Every possible means has been provided to keep the men in good health. The buildings are well ventilated, and all the sanitary requirements are well cared for. The design of the buildings and the general plans were by Mr. Huerne, and were adopted without any demur. Water is brought to all the dwelling houses and they are all properly sewered.

In the panoramic view, Figs. 1, 2, 3, 4, 5 and 6 show stations in the canal where vessels turn out to let others pass. Fig. 7 is the dam for controlling the waters of the upper Chagres; length, 1,500 meters; breadth, 960 meters; hight, 45 meters. Figs. 8, 9, 10 and 11 are valleys inundated by the rivers Chagres, Chilibre, Pequeni, Gatuncillo, hight of the inundation, 38 meters; volume of the water, 1 milliard cubic meters. Fig. 12, lower Chagres, separated from the upper by the levees of the canal. Fig. 13, discharging ditch formed by the bottom of the levees. Fig. 14, cut of the Calebra, hight, 87 meters; length of the canal, 74 kilometers, 49 being in plains, 28 in the rocks; breadth, bottom, 22 inches in plains, 24 meters in rocks; water level, 50 meters in plains, 28 in rocks; depth, 8 meters, 50 in plains, 9 meters in the rocks; shortening of distances by the canal from 1,400 leagues to 4,800 leagues.

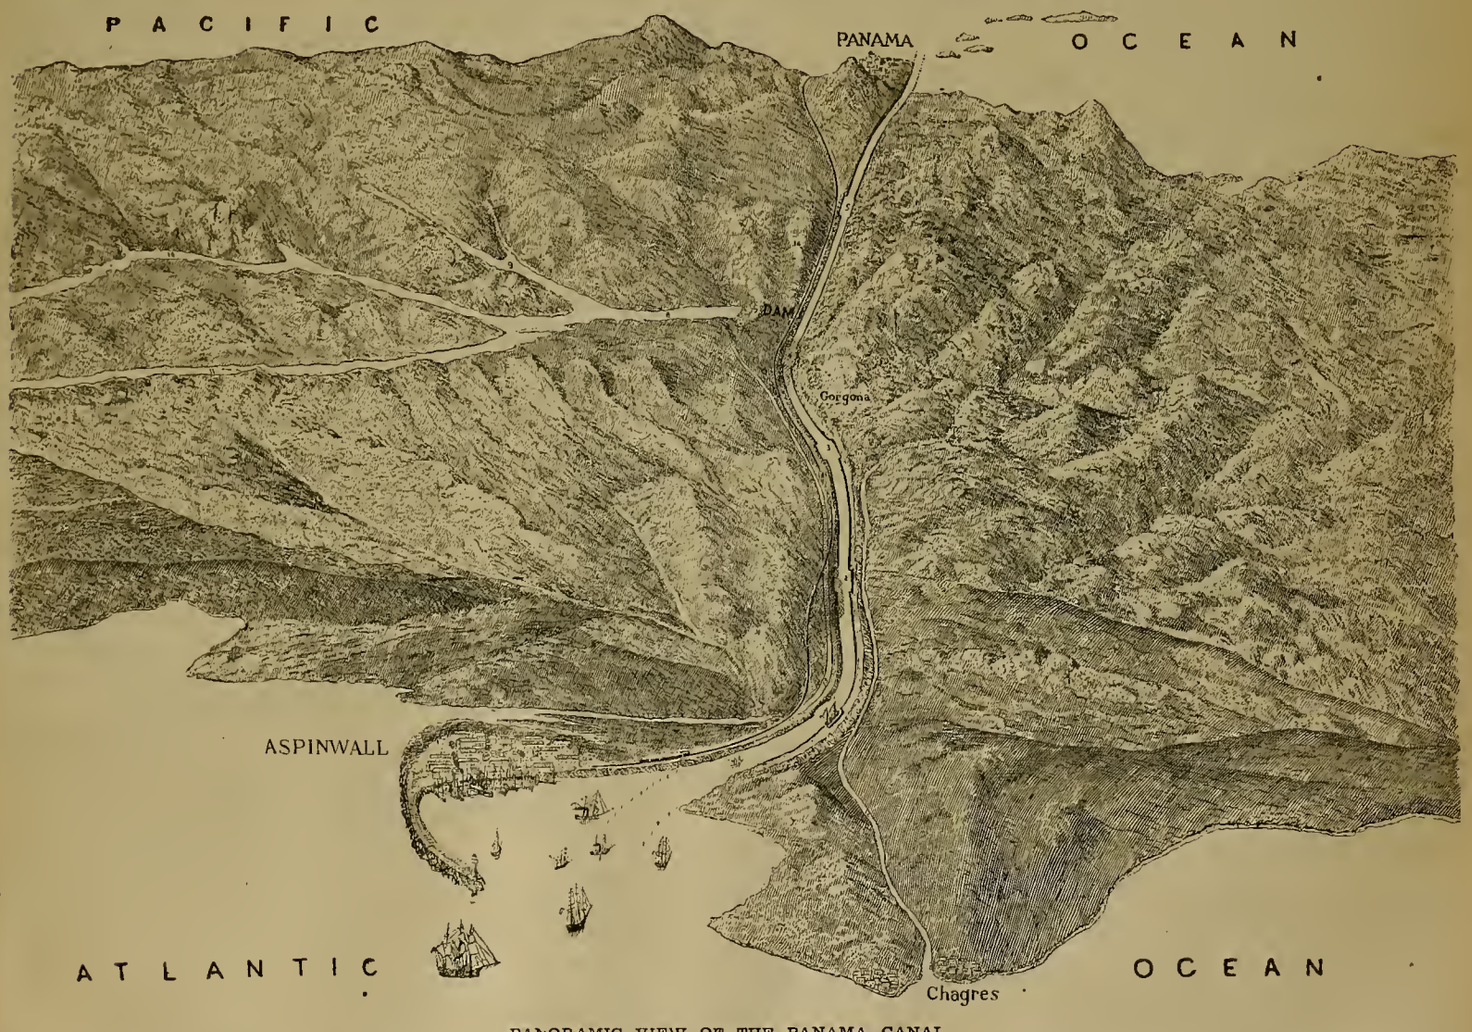
The survey and staking of the line of canal has been accomplished by two corps, which has employed a large number of natives. The check surveys and leveling of the railroad have been finished from Colon to a point beyond Pedro-Miguel on the Pacific side. The bench marks of the leveling have been engraved on the abutments of the railroad bridges, and also on the mile-stones at the necessary points.

The leveling of the longitudinal section of the large canal and likewise the cross sections already laid out, have been connected with the line of the railroad which serves as a base, the level of which commences at the ocean, and which was determined by the first observations made by the hydrographic corps.

The staking out of the work in the mountain regions is nearly completed. There still remains, however, a small amount of leveling of ditches between Obispo and the Chagres river and the crossing of the neighboring summits, the timber from which has been cut down in order to facilitate triangulation. Two corps are at work on the survey of the dam for the reservoir at the head of the upper Chagres.

A corps has been organized to run a line across the mountains by way of Upper Obispo and the river Pedro-Miguel, although the reconnoissance made of this district last year seemed to show that this passage was not as favorable as that by Calebra. The engineers consider that it is necessary to verify this by correct level in order that no possible economy may be overlooked in the definite staking of the canal. Another line is run from the mouth of the canal near Panama to an embouchure on the Rio Grande.

Instruments will be placed on the Chagres at Gamboa for the purpose of observing the velocity of the current and the rise and fall. Similar observations will be made on the Gatuncillo and the Obispo, affluents of the Chagres and on the Rio Grande. At Colon surveys are being continued in order to determine the mouth of the canal, and also works for the protection of the harbor.



PANORAMIC VIEW OF THE PANAMA CANAL.

About 1,500 soundings have been taken in the immediate neighborhood of the line of projected mouth of the canal. Samples of the bottom are taken with each sounding, with a view of determining its hardness. The bottom of Colon bay is covered with mud, which is in certain places mixed with sand; and near the shore, pure sand is found, mixed with small shells. The rest of the bay is bordered with a belt of coral. The softest mud is at the mouth of the Folkes river. This deposit was originated by the stoppage of the current around the island, owing to the construction of the railroad embankment. It can be dredged out, however, if it is decided to make there a harbor of refuge for deep-water ships and coasters.

The temperature varies in Colon between a maximum of 30° C. and a minimum of 21° 9′ C.

(CONTINUED ON PAGE 196.)

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

The Mining Interest in New York.

[From Our Regular Correspondent.]

The group of mines known as the State Line, Nos. 1, 2, 3 and 4, ars attracting much attention here. The transactions in thsse shares are large, and the management seems to havs prices well in hand. Con. Virginia has lately become a favorite stock for speculation in ths New York boards, several thonsand shares changing hands each day, and almost always a larger amount than is sold in San Francisco in corresponding sessions.

New Incorporatione.

Articles of incorporation have heen filed in the County Clerk's office, New York, for the establisbment of the followingnamed companies: The Bright Star Gold Mining Co., capital stock $2,000,000, divided into 200,000 shares of $10 each. The trustees are D. W. C. Morgan and four others. The Hamilton Mining Co., of Nevada; the capital stock is $2,500,000, divided into 250,000 shares of $10 each, and the trustees are L. E. Granger and 18 others. The Silver Belt Mining Co., of Nevada, same amount of capital etock, and similarly divided into shares, with the same named trustees.

Miecellaneous Mining Iteme.

From various local sourcee I glean the following items of intercst about the mines:

The Ontario (Utah) mine produced, during the first fortnight of August, $89,609, assay value.

The Custer (Yankee Fork, Idaho) mine yielded in tbe first 11 days of the month, $5,264 gold, and 30,883 ozs. silver.

From the Leadville mines signs of improvement are given. The Chrysolite mine shipped 83 tons of ore August 19th. Work is being resnmed in the stopes near the old Vulture claim, where the fire has done no damage.

Some very wildly flattering newe comes from the Robinson Con. mine, which has been under litigation for some time, but has finally escaped from the courts. General Manager Ewing writes: "For the week ending August 14th, inst., there were mined and ehipped to smelters 442 tone of eplendid ore, and for two weeks to that date, 908 tons. Everything in tbe mine is looking splendidly. The strike of ore jnst made in level No. 7 is immense, and assays average $125 per ton." All of which must be very comforting to etockholders who have just had to stand the payment of a large sum in compromise of title.

The Non-Aeeessable System.

The New York "promotors" have always lauded to the skies the advantages of incorporatiug mines under the New York State law, and indeed there are many good points about it. The main argument in favor of making the etock of corporations full-paid or unassessable is that it protects shareholders against unnecessary levies, or assessments called in simply for the purpose of depressing the stock for the profit of the manipulators. But sometimes the system breaks down. For instance, suppose a mine, a good one, to be controlled by a stock incorporation. In placing the etock on the market estimatss have of course to be made of the amount of money uecessary to make any required improvements; as, for example, bnilding a mill or road, or for paying for labor and supplies until returns can be had from bnllion. With etock companiee a certain amount of ready cash is indispensable. Now, suppose the amount to have bsen underestimated, and when the improvements are completed, or nearly eo, the mine to have run in debt beyond its ability to pay in cash. It is obviously a simple matter for some one to advance, for a short time, the needed fnnds, or to pass around the hat for a voluntary subscription. But sometimes it is found impossible to raise even comparatively small amounts in this way. Shareholdere have been disappointed, if not deceived, and feel unwilling, as they say here, to "send good money after bad." The result is a collapse, even in cases where, by the nse of only a little more money, the mine might have been placed on a paying footing.

Of course, if the mine were not a good one it would be much better to have it ehnt down at once, rather than drag out an artificially-prolonged and miserable existence, finally to die a lingering death, painful alike to etockholders, management and creditors. But I am speaking of properties which might or ought to be paying investments.

In the course of my travels through the mining districts last year, I came across several instancee of the kind. One was a peculiarly hard one. A fine 20-stamp mill had becn put up and other expensive improvements had been made. I think the company had expended about $150,000 in all. They had met their bille promptly and established a good reputation for solidity, when snddenly, owing to a miscalculation of expense, the fnnds gave out. A comparatively emall indebtednsss was incurred, but such was the distrust of the non-assessable system that teamsters refused to hanl ore from the mine to the mill, and miners to work longer on ehort credit. There seemed no reasonable doubt but that with a little more money on hand, the company would have pulled through and mads fair profits. But the sharsholders and management as well wers discouraged. No one was ready to stand in the breach, and consequently ths mins was closed down. Here wers $150,000 practically lost, as it would be hard to sell a propsrty so circumstanced, mersly for the want of $10,000 or $15,000 more to make good the dsficit. The company is therefore practically bankrupt today.

Ths system has also the disadvantages of weakening the credit of companies opsrating under it. In Nevada, even tbough a hig San Francisco company may be losing money hand over hand, the miners and purveyors of supplies feel reasonably confidsnt that thsy will get thsir pay from assssment monsy, if not ont of the mine itssl. But in the case of non-assessable mines, paymsnt depends upon the mere chance that somebody may step up and sattle.

On the whole, I think the New York system the best for stockholders. It may have the effect of causing mines, which might bs mads to pay, to bs abandoned or lie idle for long psriods; hut it certainly in the long run saves money. If New York or Boston men had controlled the Comstock from the bsginning, they would undoubtedly have given up long before the Crown Point bonanza was etruck, to eay nothing of the later "big bonanza." But on the other hand, if they would have lost in this case, they might have saved in other directions enough to counter-balance the loss. Erring through timidity may be no worse than going too far through recklessness. And certainly New Yorkere never would have kept up the crowd of assessment claime which are doing so much to deplete the country.

But after all, there is no denying the fact that Eastern managements are anything but popular in the mining regions. How often, after an experience like the one quoted, have I heard miners, mill-hands, shop-keepers, and teamsters alike, all praying earneetly and with one accord for a California company to take hold—"then things would be lively," they say.

PAUL WARD.

New York, August 28, 1881.

Georgetown, New Mexico.

A correspondent of the *Herald and Southwest* says: Our camp looks better to-day, and it ie yielding more ore, than at any time in the past. In the "Naiad Queen" there is ore visible in considerable quantitiee in every drift, and in some of them, in very large quantities. They have already hoisted 75 tons this week, and by Saturday they will have reacbed 100 tone of very fine ore, which will no doubt average 100 ozs., or more per ton. The upper mill—10 stamps—produced last week 15,000 ozs. of fine silver, and will probably equal this amount per week for some time to come, as they are now running on high grade ore. Heretofore they have been rnnning a great portion of the time on low grade ore, assorted from the dumps. They work in this mill 20 tons per day, and 4 or 5 tons in their lower mill of 5 stampe capacity. The latter they nse for working custom ore. Both of their mille are in the charge of Mr. John Spiller, a gentleman of large experience in the business of reducing ores. He not only givee entire eatisfaction to the company, but to all who take ore to him for redncticn. This fact epeake volumee for him, as mill men are generally looked upon with enspicion, by those for whom they attempt to reduce ore, at least. The extension of the "Satisfaction," also owned by the Mimbres mining company, is improving greatly in appearance and is turning out several tons of rich ore daily. These two mines will keep their mills running continuonsly and if the output continues to increase in the future as rapidly as it has for the last two or three months, they will soon need a 40-stamp mill to reduce their ores instead of the 15-stamp used at present. The company has recently ordered an engine of considerable power, which will replace the one now used on the "Naiad Qneen" for hoisting purposes, and which will be used for the same purpose on the extension of the "Satiefaction," which will greatly facilitate work on both mines. Thie company owns other mining property in this camp, but is not doing much work on any of their other mines at present.

The "McGregor" mine has been yielding ore in very considerable qnantity of late. They have now at the mill and on their dnmp upwarde of a hundred tons of ore that will graze 200 ozs. per ton, and which will give the lucky owners of this mine a handsome sum. The "McGregor" has been a paying institution from the day of its discovery, with the exception of a short period, when a large amount of deadwork had to be done to place it in proper working order, and no mine in thie rich camp yields a finer grade of ore.

The "Commercial" mine, lying contiguous to and between the "McGregor" and tbe "Naiad Queen," is also yielding good ore, and in paying quantity. This mine, like the others above named, has never failed to pay its owners well, and from all appearances will continue to do so for yeare to come. The "Satisfaction" property, owned by Stevens, Holt & Walters, of this place, is now bonded for $40,000.

THE *Southern Utah Times* makes the prediction that the time is not far distant when the mining of copper will take rank among the chief industries of Utah.

Steam in Land Reclamation.

It was only last July that Mr. Gladstone, in the Houss of Commons, in courss of the discussion upon an amendmsnt to empower the Land Commission to purchase wasts lands in Ireland, said that of all enterprises connected with agricultural improvements, "there was none so difficult, slippery and hazardous as the reclamation of land." No doubt be had in his mind the reclamation of the Duke of Sntherland, who reclaimed 2,000 acres at a cost of about $500,000, or $250 per acre. But then the Duke of Sutherland was new in the bnsiness, and in his later creations has used steam cultivators, of which it is written:

We believe no intelligent person could witness the striking sight of Messrs. Fowlers' powerful steam plow holding its way steadily along the roughest surfaces it has to encounter, cutting a duplicate furrow (surface and subsoil) of the depth of two and half ft. at same operation, without fear of either breaking or sticking fast on the most stubborn rock-head; or the patent "disc-er" following and tearing ths toughest "divot" into a fine mold, without admitting that the Sutherlandshire experience has accomplished a marvelous success in the adaptation of steam power to the reclamation of waste land.

How much tbie later land will cost the Duke, we do not know, but local authorities believe it will be profitably secured, and that there will be an exception to Mr. Gladetone's dictum on his own soil.

There are many who will grant the truth of Mr. Gladstone'e remark as applied to California reclamations, when they remember the money they have lost in insufficient leveeing on the tnle lands. There are othere who are still at work in the full belief that a good levee will settle the problem, who will admit that Mr. Gladstone's adjective "slippery" taken in its literal sense is true of the work they have in hand. For in the Duke of Sutherland's venture he had to deal with "heath-land moor and hilleide," while our reclaimers work in the mud which they have to take up in giant spoonfuls from the river bottom and deposit on their levees.

This leads us to remark the intsresting and effective machinery which has been devised to meet the needs of California capitalists and resident representatives of foreign capital and which are just now a prominent feature of our mechanical engineering. There is the immense dredger built by Gen. Williams and now at work on his tule estates. So far has its fame gone abroad that DeLesseps has sent for photographs of it to aid in the construction of his Panama canal machinery. There is another dredger which was built in Stockton, and planned by John W. Ferris, Supt. of the Glasgow Co.'e entsrprise on Roberte island. The Stockton *Independent* givee an interesting decription of this machine and ite work.

Briefly, the machine is, first, a boat or scow, on which the machinery is monnted. Through the center of the scow is a well, in which works a "spud" or pile, which sinks in the mud and holds the boat in place whils the dirt is being excavated. The boat can swing around on this pivot, if need be, cutting a swath all around it, and it must cut a width of 42 ft. to clear a road way for the boat. It can cut 12 ft. from water line down; but, where at work, it is unnecessary. It is now working in an old canal between the levee and the river, made by former land excavations in building the leves. This canal, when filled at high tide, wss locked at each end, thus holding the boat at one tide level while the work is being performed. It could start from the river inwards, cutting its own road across tbe island to the opposite shore. In fair work, with four men, one on the hank or levee to prepare it for the harrows, this engine can excavats and place in position 500 cubic yards of earth in one day of 10 working hours. The buckets, which run on an endless chain, hold three cubic ft. each, not counting the overplus, or lip room of the buckets, which go far to make up any deficiency in partially filling those which happen to take a light cut. The engine, 10x20 cylinder, works easily on 700 pounds of Wellington coal per day, raising this material 20 ft. above the deck, where it is discharged into a hopper, theuce to the conveyer which deposits it on the levee. Tbe bottoms of ths buckets are open to permit ths escape of the water, for the dryer tbe earth can bs placed on the levee, the better the work is when finisbed. The buckets ars four ft. from center to center and speeded at an advancs of 75 ft. per minute. The conveyer is on the elevator principle. It baś an extension of 75 ft. It is composed of an endless chain on each side—canvas lining—traversed with hard wood slats, two ft. apart, to which are attached iron rollers which run on railroad tracks above and below. From the hopper to the levee, the slope of the conveyer is enough that tne weight of the material carried materially assists the force necessary to move it to sbore. The capacity of this machine for mud dredging, if careless where and how it was deposited after lifting, would be 1,000 to 1,200 cubic yards per day.

We find in the *Independent's* account of the work of the Glasgow company, a record of some teste with different kinds of scrapers which will he of value to levee builders and ditch makers everywhere, hence we quote as follows:

Three kinds have been tried, and submitted to actual working tests, the results of their work being carefully measured. They were the four-horse scraper, made in Stockton by Lisenden, commonly called the Southern Pacific scraper; McGuire's old-fashioned scoop-shaped, and the Chicago scraper, each two horses. At this test, the basis of measurement of the holdinc or carrying capacitics of the scrapers was arrived at hy taking a given number of loads hauled in, indiscriminately, and measured. It was found that the McGuire scraper had a capacity of 4½, the Chicago scraper 8, and the Southern Pacific four-horse scraper 13½ cubic ft. Mr. Ferris kindly furnishes the following figures and estimates of scraper work, as tested by him on these works. The time occupied by a scraper making an average round, hauling dirt, say 65 ft., equals 1¾ minutes.

The cost of a scraper team is as follows:

Wages of driver	$1.00
Board of driver	50
Two horses' hire	75
Two horses' feed	50
Superintsndence	25
Cost of two-horse team	$3.00
Extra for additional pair of horses	1.25
Total cost of four-horss team	$4.25

Taking, therefore, the capacities of the several scrapers as above, the McGuire scraper should take in 58½ cubic yards per day, of 10 hours; the Chicago scraper, 100½; the Southern Pacific four-horse scraper, 170. Allow a discount of 50% for delays of different kinds and capacities of ths various scrapers, and the cost of work done by them may safely be taken as follows: McGuire scraper, 28 cubic yards per day, at cost of $3.00, equals 10¾ cents per yard; the Chicago scraper, 50 cubic yards per day, at a cost of $3.00, equals 6 cents per yard; the Southern Pacific four-horse scraper, 85 cubic yards per day, at a cost of $4.25 per day, equals 5 cents per yard.

A test of 851 ft. of levce was devoted to a trial of the Southern Pacific four-horse scrapers—ths conditions were favorahle, that is to say, the matcrial was free from weeds and lumps and the hight of fill was not over about 4½ ft. They completed 5,937 yards in 62½ days'work, or 95 cubic yards of earth moved per scraper per day, at a cost of $4.25, or 4½ cents per cubic yard.

Land reclamation is one of the most interesting of our agricnltural operations, and ws shall always be glad to hear from our readers the methods and results of any operations they may havs carried out.

A Fine Field for Mining Enterprises.

Now that it has been decidsd to run a tunnsl on the west side of Wolf Creek, to drain the propsrties purchased by the Menlo Mining Company, of New York, which will ultimately bs extended for the benefit of other important mining claims, interest is natually excited in anothsr projsct which has long bean in the minds of many miners in this district, and that ie the driving of a tunnel from the east side of Wolf Creek into Osborn Hill, the high range less than a mile distant, which is traversed from end to end with gold-bearing quartz leads, and from the earliest discovery of quartz in the district has been one of the favorite fields for mining and prospecting. This range is several miles in length, and is completely ribbed with qnartz veins from its western to its eastern base, there being in all at least sixteen parallel veins, having a strike from north to eouth, and nearly all a western dip. As early as 1851 claims were located on Osborn Hill, and the mine of that name producsd largely up to the year 1857, and with euccess for years later. The Whecl Betsy was another claim that produced for a long time ore that averaged $40 per ton. The Houston Hill mine which is at the northern end of the range, wae a valuable mine at one time, and from 1864 to 1867, something less than three years, produced $500,000. There were other producing mines on the range at that time, and in later years there was the Ione, Ben Franklin, Sebastopol, Redan, Alaska, and others that will be remembsred by many readers, and at the preeent time there are the Centsnnial and Prescott Hill that are being worked regularly. A tunnel from Wolf Creek into the center of Osborn Hill would strike the range nearly 1,000 ft. below the surfacc, and then with lateral drifts would give drainage that would open up a vast extent of valuable mining ground. The veins of that section are not widc, as a rule, but the ore is generally a high grade, as was originally the case with the Osborn and Houston Hill minee, and is now ehown by the Centennial ores, which go from $60 to $100 per load. The possibilities of rich mining development by a tunnel such as suggested are very great, and since it has been shown, in the case of the Menlo tunnel soon to be started, that outside capital is willing to seek investment here, it is worth the while of those companies located on Osborn Hill to make a big effort to induce a similar venture of money in that direction. It is certain to be done some day; in fact it shonld have been undertaken long ago; and now is an opportune time for men of business and mining sagacity to begin to move in the matter.—*Grass Valley Union.*

SPECIMEN STEALING AT THE IDAHO MINE.—A discovery was made at the Idaho mine on Snnday morning which resulted in the summary dismissal of five miners, in whose dinner buckets quartz specimene were found. The underground work in the mine is discontinued at 12 o'clock midnight on Saturdays, but the shaftmen, of which these five men were part of the force, work until Sunday morning. The shift was composed of eix men, who were in the habit of taking their dinner buckets down in the mine with them, and as they came to the surface on Sunday five of the buckete contained specimens. As there were no other miners underground from midnight to daylight, the opportunity for looking for specimens was good if the men were dishonest enough to take advantage of the situation, which it seems five of them were. The Messre. Coleman are said to have made the discovery, being on hand when the men came off shift. Whether they had cause for suspicion is not known, as little dircct information can be obtained in regard to the matter.—*Nevada Transcript.*

ARIZONA MINES AND CHINESE CAPITAL.—From a letter in the Arizona *Journal* we take the following paragraph: As capital is the backbone of a mining camp the prospects of Dos Cabezas have been brightening up lately under the influence of heavy investments made by the Commonwealth Consolidated Mining Company of Arizona, a syndicate of moneyed men residing principally in Shanghai, China. They have purchased sixteen mines in and about this camp and have bonded some half a dozen more. On the most of these considerable prospecting has been done, and already the showing is sufficient for my saying that Dos Cabezas will be a bullion producer before months roll over our heads.

IT ie reported that a number of Philadelphia capitalists have purchased the Nuestra Senora, an old and valuable Mexican property, situated at Sinaloa, Mex., embracing over 8,000 acres of mineral, timber and agricultural lands.

MECHANICAL PROGRESS.

New Sheets in Old Boilers.

It becomes necessary sometimes—particularly in common cylinder boilers—to renew the fire sheets, or those directly exposed to the action of the fire. At points over the bridge wall for example, particularly if the latter is too closely set, rapid deterioration ensues and renewals are required when the rest of the boiler is comparatively new. Sometimes after such renewals accidents occur; the boilers give out, and always leak to a greater or less extent in other parts of the structure.

We apprehend that this is due to purely natural causes, or we may say mechanical defects, which in the present article we do not propose any remedy for. We do not know of any; that is a point for consideration. We think it will be conceded that a steam boiler that has been used for a length of time, say six months, has acquired a condition of what may be called natural tensions. That is the several sheets by alternate heating and cooling and through the working pressure have settled to something like a uniform state of resistance, so that, as far as possible, they are uniform throughout. Suppose, now, that we cut out a sheet or two, what have we done? We have destroyed the tensions that existed, and instituted new ones in place of them. The inserted sheets are fitted to their places, marked off, and punched or drilled, but there is no way of making them of the same stiffness or tension as those cut out, except by making a little draft on the holes and drawing them up by a drift pin. The new sheets are slack sheets, and almost invariably leak for the first few weeks after their application.

A better and safer, though more expensive plan would be to renew the whole section of shell all around the boiler where it is weak, than to put in two or more sheets directly over the bridge-wall, or furnace, as is now done. If it is a return-tubular boiler that is to be repaired, the tube sheets need not be disturbed, as only the rivets in the heads would have to be cut. If this method was practiced, something like a balance would be restored, though the new part would be stiffer than the old. Each section, of course in the shell, however, would bear its own proportion of strain. This is not the case now, as we have pointed out.—*Mechanical Engineer.*

Modern Mechanical Progress Due to the Many.

We get our ideas of progress in any direction by comparison. We are ahead to-day, because we were behind yesterday. Viewed in this light, it is not necessary for the middle-aged craftsman to go back beyond the commencement of his own mechanical experience to see the marvelous nature of this progress. We need go back but little further to note a progress that has in itself, practically, all there is of to-day's mechanical standing. A writer on this subject has remarked, that only a few years ago the vapors from water arose and passed away unnoticed. To-day the knowledge of how to apply that vapor to useful purposes stands out pre-eminent as a great land-mark of our civilization.

It would be as idle to demonstrate what this knowledge and its application are doing for us, as to determine what material progress it is not an important factor in. Knowing as we do to-day, something of the potency of the agent, we are prepared to accord to its influence, perhaps, all that belongs to it. It ceases to be a wonder to us that we cross the Atlantic in a few days, not entirely nor mainly because it is common to do so, but because we have become educated up to a limited understanding of the agent we employ.

We cease to marvel that the distance between New York and San Francisco is reduced to a few hours, because we know something of the means by which the distance is annihilated. We may wonder that all these material agencies existed unused and unappreciated for thousands of years. Coal, and water, and iron were at hand 200 years ago, just as they are at hand to-day, and yet our immediate ancestors went on foot weary distances—measured by days—which we compass in a few minutes. We may wonder that they imperfectly clothed themselves from the products of the hand loom, while the equal of our most common products of machinery turned by steam, were, in their luxury, unknown to them. This wonder amounts to nothing except that, in itself, it is a tribute to the remarkable mental progress made within the past generation; to the conquest of matter by mind. It is no marvel that man, in daily contact with all these things, brought to witness accidental exhibitions of agencies that could hardly be called hidden, should conceive the possibility of applying, or should even rudely apply, some of them to useful purposes; but it is little less than miraculous that in so short a time the application should have advanced so far toward perfection.

This, in turn, leads to the consideration of why it is so. Scarce a generation has passed since the locomotive engine was, so to speak, in embryo, and yet to-day it is almost perfect as an example of engineering. This is due, not, as is sometimes asserted to one or two individuals. It is not to be accounted for by the superior attainments of half a dozen. It is due to the universal advancement of the many. The rude but priceless locomotive of half a century ago was the production of the few. The artistically complete production of to-day is the gift of the many. Just so it is with other great mechanical achievements. It is one thing, usually a simple thing, to conceive of perfection. It is another thing, usually a difficult one, to devise ways and means by which to approach perfection.

A short time since, comparatively, the boring of a cylinder for a steam engine with any degree of regularity was impossible. To-day the attainment of reasonable perfection in the process is one of the rough jobs of the shop. And so with all other processes.

Take the advancement in machine processes, which render possible the refinement of any particular product, and you find no individual standing pre-eminent. It would be extremely difficult to place the credit for any modern machine tool where it belongs. In fact, it can only be done by accounting for the universal increase of knowledge. Into these tools, and into these processes, and into all our great products, the individual workman puts the efforts of his brain. It is necessary to mix knowledge with matter in the production of mechanical refinements. Matter has always been at hand. Knowledge has been wanting. It has not been common. It has been confined to the few. The reason for our rapid mechanical advance is that this condition has become materially changed.

For obvious reasons the burden of mechanical advance must be made by the mechanic. Fifty years ago he was disqualified for this by ignorance, and mainly from lack of opportunities. To-day, he is qualified by intelligence and by education. Thanks to technical journals and books, the man in overalls is, or may be, better educated—mechanically—to-day, than the man in broadcloth of 50 years ago. In the future, as in the past, it is from the efforts and education of the many, rather than the few, that mechanical progress is to come.—*American Machinist.*

The Mechanic's Capital.

The mechanic is sometimes looked upon as a man without capital. Sometimes he looks upon himself in this light. This is all a mistake. The man who earns $1,000 a year has not only capital, but, in these times of low interest, he has considerable capital.

The manufacturer and the merchant aim to increase their capital by a judicious handling of present means. The mechanic does, or should try, to increase his in the same way. Knowledge to the mechanic is capital, because it enables him to command more for his services. If he possesses simply the skill of the workman, he can make that skill earn him a certain sum per year, which sum is the exponent of the capital he has invested in his business. If, to the skill of the workman, he adds the knowledge of the man who thinks beyond present purposes, he earns more, or in other words, increases his capital. The young machinist, for instance, who learns machine drawing, is morally certain at some time to find use for it where it will stand exactly to him as the money of the capitalist stands to its possessor; although this is hardly a fair statement, because he will at once find use for it. When the man who earned $1,000 a year by virtue of his skill as a workman, adds such a knowledge of his business as to earn $2,000, he has as surely doubled his capital as the man who has twice as much money to invest in his business as he formerly had.

It is earnestly advised that every apprentice to the machine business shall do a little calculation for himself on this subject, always remembering that capital which is the result of skill and knowledge is seldom at a discount, and never lost. It is just at this time in their lives, when habits are formed, that to a great extent determine the working capital with which they are to go through life.—*American Machinist.*

NEW USES FOR GLASS.—It is stated that Mr. Frederick Siemens contemplates adapting his toughened glass to street gas lamps, substituting glass for the iron pillars, and for water main pipes. These articles, it is claimed, are much stronger than iron castings, and imperishable and incorrodible. It is said that common castings, which are now procurable at prices which do not return the iron founder more than the barest profit, or none at all, can be produced in Siemens' glass at about twice the figure, giving ample profit to the manufacturer. As the specific gravity of glass is only about one-third that of cast iron, the purchaser will be able to obtain glass articles at about 33% cheaper than similar goods in cast iron, as he will get, say, three pipes for the weight of one cast-iron piece of main.

GIVE US A FEW PANS.—The Yreka *Journal*, of Aug. 24th, says that "the Kanaka company on the Klamath river, cleaned up 160 ozs. for six days' work last week, with 12 men working on each shift, or 24 men for day and night, each shift working for 12 hours. This claim seems to be on a level bench of bedrock, and pays very regular, with some exceedingly rich spots. Several persons visiting the claim have been told to pan out a prospect to keep, and the poorest panning has been $10."

SCIENTIFIC PROGRESS.

Continental and Island Life.

Just as political geography sometimes presents boundaries not in accordance with the physical structure of countries, so the distribution of animals and plants shows many peculiar and unexpected features. Hence naturalists have divided the continents into what Sclater has called zoological regions, which are, so to speak, the great empires of animal life, divisible often by less prominent boundaries into provinces. In vegetable life similar boundaries may be drawn, more or less coincident with the zoological divisions.

Zoologically, North America and Greenland may be regarded as one great region, the Nearctic, or new Arctic (the prefix not indicating that the animals are newer than those of the old world, which is by no means the case). South America constitutes another region, the Neotropical. If now we turn to the greater Eurasian continent, with its two prolongations to the south, in Africa and Australia, we shall find the whole northern portion, from the Atlantic to the Pacific, constituting one vast region of animal life, the Palearctic, which also includes Iceland and a strip across North Africa. Africa itself, with Madagascar, whose allegiance is, however, only partial, constitutes the Ethiopian region. India, Burmah, the south of China, and certain Asiatic islands form the Oriental region. Australia, New Guinea, and the Polynesian islands constitute the Australian region.

All of these regions may, in a geological point of view, be considered as portions of old and permanent continental masses, which, though with movements of elevation and depression, have continued to exist for vast periods. Some of them, however, seem to have enjoyed greater immunity from causes of change than others, and present accordingly animals and plants having an antique aspect, geologically speaking, in comparison with the others. In this sense the Australian province may be regarded as the oldest of all in the features of its animal forms, since creatures exist there of genera and families which have very long ago become extinct everywhere else.

Next to this in age should rank the Neotropical or South American region, which like Australia presents many low and archaic forms of animal life. The Ethiopian region stands next to it in this, the Oriental and Nearctic next, and the last and most modern in its aspect is the great Palearctic region, to which man himself belongs, and the animals and plants of which vindicate their claims to youth by that aggressive and colonizing character already referred to, and which has enabled them to spread themselves widely over the other regions, even independently of the influence of man.

On the other hand, the animals and plants of the Australian and South American regions show no such colonizing tendency, and can scarcely maintain themselves against those of other regions when introduced among them. Thus we have at once in these continental regions a great and suggestive example of the connection of geographical and geological distribution, the details of which are of the deepest interest, and have not yet been fully worked out. One great principle is, however, sufficiently established; namely, that the northern regions have been the birthplace of new forms of land life, whence they have extended themselves to the south, while the comparative isolation and equable climate of the South American and Australian regions have enabled them to shelter and retain the old and moribund tribes.—*Princeton Review.*

What Causes the Blood to Circulate?

To what degree the heart is aided by other forces is yet a matter of investigation. Probably there are, several forces assisting. The elasticity of the arteries increases their carrying capacity. They are firm, elastic tubes, which expand under the pressure from each heart-contraction, and then by their own elasticity contract and help the onward flow of the blood. In the smaller arteries the flow loses the intermittent character it possesses in the larger arteries, and becomes a steady stream. The elasticity of the arteries serves precisely the same purpose as the air chamber of any force-pump, that of equalizing the flow, and so increasing the amount delivered. The whole force is derived from the heart; the arteries cause the force to act continuously.

The veins are lax tubes, somewhat larger than the arteries, and capable of holding all the blood of the body. They convey the same amount of blood as the latter, but more slowly. In the larger veins, however, near the auricles, the velocity may be 200 millimetres per second. They are provided with valves which effectually prevent the blood from flowing backward toward the heart. Any compression, produced by muscular contraction, or otherwise, will therefore assist the forward flow of venous blood. This is one explanation why exercise hastens the circulation. The movement of the chest in breathing probably aids the pulmonary circulation, the blood, as well as the atmosphere, tending to fill the vacuum during inspiration.

Physical capillary force is not generally regarded as an active force in the circulation. But there is an admitted force in the capillaries, resulting from the attraction of the tissues for the arterial blood, containing the required oxygen and nutriment. "The vital condition of the tissues becomes a factor in the maintenance of the circulation." It is this force, primarily, which adapts the amount of blood to the varying needs of any organ; the nervous system regulates the supply by varying the caliber of the vessels.

The force in the capillaries, or some other force, carries the blood, after death, from the arteries, where the heart leaves it, into the veins. Finding the arteries empty after death gave rise to the idea that they conveyed only air; whence the name. It was this belief which Harvey overthrow in 1620.—*Popular Science Monthly.*

Ozone as a Cause of the Luminosity of Phosphorus.

Various writers, especially Joubert, have called attention to the connection of the phenomena of phosphorescence with ozone. To learn something of the nature of this connection, Chappuis has studied the effect of ozone upon the luminosity of phosphorus in the presence of oxygen. Fourcroy had long ago observed that in pure oxygen, at a temperature of 15° and under atmospheric pressure, phosphorus is not luminous in the dark. Chappuis now finds that under these conditions a bubble of ozone introduced into the bell jar produces the phosphorescence, though only momentarily, the ozone being destroyed. Moreover, it is not the vaporization of the phosphorus which determines the phosphorescene, but the combustion of this vapor, the entire space occupied by the oxygen at first appearing luminous, the solid becoming so only after all the vapor has been burned by the ozone.

Two cylinders, one containing air, the other pure oxygen, were inverted over two dishes containing iodide of potassium and starch solution. A fragment of phosphorus was plunged into each gas, in contact with the liquid. In the first, the phosphorus became luminous and the solution became blue. In the second neither phenomenon appeared. Whenever the phosphorescence appeared, ozone was present; and whenever ozone was absent there was no luminosity. Moreover, the author calls attention to the fact that certain bodies which have the power of preventing the luminosity of phosphorus are precisely those bodies which destroy ozone or are destroyed by it. Oil of turpentine, for example, which is the most active, destroys ozone completely. In a balloon containing air, phosphorus, and turpentine, a bubble of ozone produces light for a second only, the ozone being destroyed by the turpentine, but burning a part of the phosphorus vapor also. On adding the ozone the luminosity extends throughout the space, and at last the solid phosphorus only remains luminous. Hence the author regards the production of the luminosity of phosphorus in oxygen as one of the most delicate of the reactions for ozone, and purposes to employ it in subsequent researches.—*Bull. Soc. Ch.*

The Extraction of Iodine.

The methods of extraction of iodine and bromine from seaweed have undergone a great transformation during the past few years, but so far the processes generally employed have necessitated the incineration of the seaweed, and consequently its destruction as a manurial agent. In order to extract the iodine without destroying the organic matter, Messieurs Laurot and Collet treat the weed with either hydrochloric, sulphuric, or phosphoric acid, or with the bisulphate of soda or potash.

The weed to be operated on, says *Design and Work*, is placed in a suitable cistern of wood, iron, or cement, lined with lead, and so arranged that it may readily be heated by means of a steam coil or jacket. It is then sprinkled with one of the substances named, in proportions varying with the nature of the mass from 1% to 5%.

At the bottom of the cistern a layer of liquid is formed, and heat is applied to bring the whole to the boiling point. After a short time the contents of the cistern form a kind of broth consisting of a clear liquid and a finely divided pulp, which is easily removed from the liquid by means of a filter press.

The liquid thus obtained represents almost the whole of the moisture, the iodine, and the soluble matter contained in the weeds submitted to the operation.

This liquid is allowed to deposit the solid matters which it may hold in suspension, and it is evaporated down to half its bulk in a closed boiler, the steam which it gives off serving to heat the contents of another cistern.

When it has been brought to this condition the liquid is transferred into appropriate vessels and mixed with perchloride of iron, nitrous sulphuric acid, manganese, or any other reagent capable of setting at liberty the combined iodine. The whole is then made to boil, when the vapor carries away the iodine which is condensed and collected.

The acid liquid remaining behind is mixed with phosphate of lime in sufficient quantity to render the phosphoric acid soluble, and the whole is then dried.

A GOLD COLOR DYE.—It is reported that two professors of chemistry in Zurich have discovered, after much labor, a splendid gold-like color, which can be applied even on fabrics.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Western, Sept. 6th, $12,162; Standard Con., 5th, $47,359.09; Northern Belle, 7th, $6,699.42; Head Center, 11th, $4,800; Syndicate, 6th, $6,-610.52; Bodie Con., 12th, $6,283; Northern Belle, 10th, $12,137; Barbee & Walker, 5th, $3,053; Horn Silver, 5th, $10,553; Germania, 5th, $5,700.

THE excitement about the Safford district, the new mining camp near Palisade, on the Central Pacific, is unabated. Very rich rock is being brought to Eureka from the district, and mining men are very enthusiastic.

THE probable bullion yield for the Butte mining district for the year 1881 [will be $6,000,000.

MINING SHAREHOLDERS' DIRECTORY.

The Mining Share Market.

Our stock tables will show how much of an excitement there has been this week in the stock market. This has been principally due to the report of a strike in the Sierra Nevada.

All that could have possibly given rise to the report of a rich body of ore in the Sierra Nevada is the fact that the joint Sierra Nevada and Union Con. winze ran into a stringer of ore about 15 ft. below the 2700 level. It amounts to nothing greater than a dozen or more like stringers encountered in the same winze from the 2400 level down.

The Gold Hills *News*, which is probably posted on the situation on the Comstock says: There is not any work being done in the bottom of the joint Sierra Nevada and Union Con. winze. A drift is being run from this winze on the 2700 level that is supposed to have run into stringers of ore or into a small sized ore body. The supposition is indulged in by outsiders, and it is doubtful if they know much about it. Senator Fair is not yet inclined to unbosom himself, and until he does speak or permit mining experts to examine the reported strike, there will be nothing definitely known as to what the mine contains. It is to be hoped the rise in stocks is justified by the condition of the mine. If such is the case, there has been plenty of time to discover the fact, and it should be made known.

The only work carried on in the Bonanza series of mines the past week has been repairing. It is expected to place the old force of workmen back in a day or two, however. It was owing to the intense heat in the mines that the workmen were removed, but the ventilation is now rapidly improving. The Savage management promise to begin the extraction of low grade ore shortly. Considerable attention is attracted toward Chollar and Potosi. A crosscut is being run in the latter mine which is in kindly formation. A similar drift will be started in Chollar before long. Preparations are being made to work the Alpha joint with Imperial. Belcher has got to work at extracting low grade ore again, and will shortly be followed by Crown Point. The joint shaft of these two mines will be repaired by Monday next. The Justice mining company announce their intention to resume work shortly.

THE red clayey soils of California are the best fruit lands we have; that is, they will successfully produce a wider range of fruits than any other class of soils to be found in the State.

A FATAL shooting affair occurred at the Empire mine, Park city, Utah, on Sunday, resulting in the killing of Frank O'Reilly, the superintendent of the mine, by G. W. Scott, engineer of the same mine. The quarrel had its origin with O'Reilly, so Scott reports, and he says that he acted in self-defense, shooting the former three times as he advanced upon him with a knife. Scott fearing violence from O'Reilly's friends, gave himself up, and was brought to Salt Lake and lodged in jail. The affair has caused great excitement at Park city, as both parties were well known.

THE cost of working the copper mines of Lake Superior, Michigan, varies from 11 cents to 23 cents per pound of the ingots produced. The cost of the ingots from three of the mines for 1879 was as follows: Atlantic, 12.20, Central, 11.16, Quincy, 13.71. This is the best that either of these mines has done. Last year the Central's copper cost 11.85 to produce.

COULD investors be induced to realize that it is better to take slight chances on the loss of a small amount in the development of virgin claims than the greater loss on old, exhausted or nearly exhausted dividend mines, both themselves and the country would be great gainers. By a judicious selection of prospects the chance of loss is reduced to the minimum.

A LOT of concentrated ore from South mountain, says the Winnemucca *Silver State*, has arrived here for shipment to San Francisco. Base bullion by the wagon load may be expected here shortly from that camp, if reports from there are correct.

THE taking out of great quantities of gold at Klamath river, together with successful quartz, placer and hydraulic mining operations, promises to make times more prosperous in Siskiyou this fall than ever before, and especially in Yreka.

THE Morning Star mine at Leadville was recently sold for $1,300,000. The capital has hitherto been $6,000,000, but is to be reduced to $1,000,000 by the 1st of October, at which time the new owners come into full possession.

THE Mott claim, on the Klamath river, below Virginia Bar, is paying about $5 to $8 per day to the hand, and gradually improving as the work of sinking progresses.

THE Chrysolite mine paid a dividend of $100,000 on the 10th. It is said that a handsome surplus is carried forward.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

PURCHASED.—Amador *Dispatch*, Sept. 10: The Owen Kelly claim, on Murphy's ridge, about 2 miles from Jackson, toward the Mokelumne river, has been purchased by W. F. Walton for a Boston company, and work will be commenced upon the mine immediately. The claim is on what is known as the mother lode, and has always prospected well, and there is but little doubt that when this mine is developed it will make glad the hearts of the Bostonians who have just bought it.

ANOTHER clean-up was had at the Grass Valley gravel mine, near Volcano, owned by McLaughlin & Co., and superintended by Mr. L. McLaine, a few days ago, giving a much larger yield than ever before. Mr. McLaine brought the bullion to Jackson for shipment below last Tuesday, and feels much elated over the yield of the mine. There are several hundred acres in the claim, and it will require 15 or 20 years of constant work to work out the claim.

MR. JAMES MORGAN is still pushing his tuunel through Murphy's ridge from Hunt's gulch, though we believe he has not yet struck the main ledge for which he is drifting. The tunnel is now in about 1,200 ft, though not in a straight direction—making an angle about 400 ft from the mouth. We understand that a large number of very rich strata has been passed through, but they are not large enough to pay for extensive working. It is Mr. Morgan's intention to build a large mill in Hunt's gulch as soon as he strikes the main ledge with the tunnel.

THE MOYLE & DOYLE MINE, in Hunt's gulch, is down about 70 or 80 ft. and at that point the ledge is about 5 ft wide, and appears to be very rich. Drifting will be commenced in a few days, and the mine pretty thoroughly prospected to its present depth. The shaft has been sunk between two ledges, and we understand that they come together near the bottom of the present sinking, and there is every reason to believe that the mine will prove rich and permanent.

THE VOLUNTEER, owned by Mr. James Meehan, is now having the water pumped out preparatory to having the shaft sunk 100 or 200 ft deeper. The hoisting works have been completed, and Mr. Meehan informs us that he intends to push the work ahead, and develop the mine thoroughly without delay. The mine has heretofore produced some of the richest rock ever taken out in this vicinity, and miners say there is no reason why there is not plenty more rich rock still deeper down.

THE ZEILE MINE is steadily going on with its work, but, owing to scarcity of water, only about an average of 30 stamps of the mill have been kept running daily. The rock is of rather low grade, but by rather economic management the mine has been brought up to a paying basis, and there is every reason to believe it will prove a permanent institution of profit. The rock is remarkably regular, paying almost exactly the same in all parts of the mine. The ledge on the lower level is about 15 ft wide, and it will require many years to work the ore body out.

EL DORADO.

THE MINES.—El Dorado *Republican*, Sept. 8: So far as we have been able to learn, the mines being operated in this vicinity are at least holding their own, and we think a little better. The Placerville Cold Quartz is turning out some very fine ore. The Grand Victory is reported to be paying better than ever, under the new management. The Springfield is keeping up its lick on $20 ors. The Bowlder and Gophermill continue to crush upwards of 20 tons per day at a good profit, while the mine is being developed. It is almost needless to mention the Lyon in this connection as it is certain of constant and large profits for years to come. At the Chapparal, work in the tunnel has been temporarily discontinued, and the force put to work in the drifts leading from the shaft, where they are stoping out some fine ore. This work was abandoned last winter in consequence of more water than could be handled. Work in the tunnel leading to the main shaft will be resumed soon. Work is being pushed ahead in numerous other properties, but to what extent we are not advised. At Crizzly Flat the principal boom of the county seems to be holding sway at present. The new Arctic mill is running. The Mount Pleasant will have a new 20-stamp mill running in 00 days, and other mills and hoisting works are going up, while others are in contemplation. We believe that will be one of the most thrifty mining camps in the State by another summer.

INYO.

BEVERIDGE TO THE FRONT.—Inyo *Independent* Sept. 10: Taylor & McEvoy's 5-stamp mill is doing splendid work in Beveridge district; 11 tons of quartz is crushed every day. Five hundred tons have been worked since the mill commenced on "Keynot" ore. The average assay value of the ore is $118 per ton; average fineness of bullion, 720. The Keynot mine has produced about $100,000 during the past 4 months, and this with a 5-stamp mill, and a few arastras. In addition to the $100,000 from the Keynot, $8,000 has been taken from the mines owned by Taylor, McEvoy & Co. Other mines that are being prospected are showing up large quantities of rich ores.

MONO.

BODIE.—*Free Press*, Sept. 13: Among the agreeable features of the past week was the resumption of operations in the University and Spaulding mines. It looks well to see the work of development progressing in these valuable properties, where it has been so long suspended. The two Frue concentrators recently purchased by the Oro company are about ready to start up in connection with 5 stamps of the Silver Hill mill. Experienced men express the opinion that this is to prove a success, in which event more concentrators will be added. The Standard is again sinking the main shaft, which is down 1,064 ft. The Lent shaft is down 740 ft, and the flow of water is not very great. The lower winzes in the Bodie are in good ore, some of it being very rich. The west crosscut, 600 level of the Red Cloud shaft, is in 131 ft. Bodie tunnel, Bechtel and Syndicate are milling as usual, and satisfactorily. Con. Pacific, South Bulwer, Blackhawk, Tioga and Boston Con. are doing prospecting work. Work will be resumed in the Champion shortly.

MARIPOSA.

DILTZ MINE.—*Gazette*, Sept. 10: The fact of the extraordinary richness of this mine is just coming to the knowledge of many who have lived in close proximity for years, and would never have been any wiser but for the instrumentality of Col Swadley, who stirred Capt. Diltz up to an accounting of his valuable possessions, which amounted to a hank or mountain of gold with unlimited and inexhaustible resources as far as can be ascertained up to this time. Capt Diltz has evidently known for years the true character of this mine. Notwithstanding, the mine is bonded for a respectable amount, it does not in the least disturb the equanimity of Capt. Diltz, for he daily pursues the even tenor of his adopted course in developing this mine. The new shaft, which was commenced about August 1st, is sunk to a depth of 00 ft, and shows a vein of ore 3 ft wide, well charged with free, visible gold. The tunnel which starts in above the shaft and runs upon the vein 80 ft. The rock is decomposed to a considerable extent, with strata of ochre passing through it which carry gold of a surprising richness. The tunnel as it stands at the present time, affords a lift of 60 ft, and when it reaches the center of the hill as contemplated, a distance of 250 ft, it will give a lift of about 300 ft. It is contemplated, at some time in the future, to start a tunnel at a point known as the mouth of Sherlock's gulch, which, when run upon the vein, would give a lift of about 1,000 ft. At present there are 600 or 800 tons of ore on the dump, and as much more in sight, estimated at an average of not less than $30 a ton and upwards.

NEVADA.

GOLD FLAT EUREKA MINE.—Grass Valley *Union*, Sept. 8: The shaft of this mine, which is on Gold Flat, Nevada, is now down 130 ft, and the ledge is making a favorable showing. A crushing of 12 loads of the rock has just been cleaned up at Crosby's reduction works, which yielded $40 per ton including sulphurets. John Trenberth, known over all Grass Valley as a miner of many years experience, is superintending operations at the mine. He regards the New Eureka as a very encouraging "prospect."

DERBEC MINE.—*Transcript*, Sept. 8: The Derbec mine shipped over $15,000 worth of bullion last month, the last clean-up amounting to about $10,500. Very rich gravel is still coming from the old shaft. The new shaft has just passed through the quicksand where the pumps had so much water to contend with, and during the next 6 weeks it will undoubtedly enter the gravel channel. Instead of being compelled to distribute the gross proceeds of the mine among laborers and mechanics, the stockholders will doubtless realize good profits. The company is now employing over 100 men, and were it not for this the town of North Bloomfield would indeed be in a sad plight since the Marysvillians caused the closing down of the large hydraulic mine at that place.

GOLDEN GATE MINE.—The resumption of operations at the Golden Gate mine near Alleghany is adding greatly to the business interests of that section. Supt. T. Burke has a full crew of first-class men at work, and is pushing developments ahead rapidly. The new pumping and hoisting machinery works smoothly. Four Frue concentrators are being placed in the mill, which will start up in a few days and run regularly. The Golden Gate is in the same locality as the famous Rainbow mine, and we should not be surprised to hear before many weeks that Supt. Burke has uncovered a bonanza like unto the Rainbow's last one.

HOMEWARD BOUND MINE.—Grass Valley *Union*, Sept 8: Work on the Homeward Bound mine is to be immediately begun, and prosecuted with vigor. The mine was recently purchased by the Meaks Mining Co., and that incorporation intends to give the ground a thorough prospecting. The sum of $20,000 was paid for the mine, and the new company took possession on Friday of last week. M. C. Taylor has the contract for putting up all the necessary machinery, and everything will be in running order as soon as possible. The machinery will consist of two powerful engines, one of which will be 14-inch. There will be 2 pumps, one 11-inch and the other 8-inch. The main shaft will immediately be sunk to the tunnel level, 230 ft, and drifts will be driven both ways on the line of the tunnel. The tunnel has been commenced, a roadway dug out, a blacksmith shop is being built, and everything being put in readiness for the pushing of the tunnel ahead. The Meaks Mining Co. will shortly give employment to a large force of men, and when once work is fully under way, things will begin to look lively in Grass Valley.

PLUMAS.

DEVELOPMENT OF MINES.—Guernsville *Bulletin*, Sept 10: A company has been formed at Quincy for the development of mining property. The company proposes to have claims bonded to them for a sufficient time to enable them to prospect thoroughly; then, if the claim be found of value, either buy out or give the owner a stock interest. Miners who think they have good claims, but have not the money to work them, may, through the agency of this company, have their property fully developed.

PLACER.

THE LOWER FOOTHILL MINES.—Placer *Herald*, Sept. 7: The mining prospects in the lower portion of Placer are said to be looking up considerably. The Newcastle Mining Co's. claim, east of Pino, is being fitted up in good shape for the winter season, and the Laird mine in the same vicinity is said to be running on better gravel than has ever before been found in the claim. Other developments of an important character are being made in the same district, which we cannot refer to at present for want of particulars.

CLEAN-UP.—Placer *Times*, Sept. 8: The Polar Star hydraulic mine shut down for this season yesterday. At least the final clean-up was made then. The present season's run has been a very remunerative one to the owners of this mine, so we understand. If the present mining suits are favorably settled, it is the intention of the Supt. N. Orceuman to fit up both the Polar Star and Southern Crose mines in good shape for next season, provided adjustments in the suits is brought in time this fall. We understand it will cost in the neighborhood of $10,000 to fit up both claims again.

SIERRA.

SAVAGE MINE.—*Mountain Messenger*, Sept. 10: Last week we visited the Savage placer mine, located near the Middle Yuba Sierra county, about 10 miles southeast of Downieville. The company have a fine large tunnel, over 1,000 ft long, through hard granite all the way. At the end of this they are pushing an upraise, finding the rock a little softer as they go up. The drilling is done by the aid of compressed air, which works to a charm. The shaft is up about 50 ft. The company have a fine engine and all the necessary appliances. The situation of the mouth of the tunnel is one of the wildest and ruggedest imaginable, being on the face of a rocky cliff 1,300 ft below the old Henness Pass road. A good wagon road has been built from the road to the mine—that is, it is a good road to go down if the brake and breechin hold. Supt. Ball showed us through the works. About 15 men are employed. It is our opinion that the tunnel is full low for the channel, which undoubtedly lies under the ridge, which is an error in the right direction. The altitude of the mouth of the tunnel is 5,175 ft.

THOCEAXN and One Gravel Co., Sierra City, contemplate sinking in the main tunnel for bedrock. One thousand ft of air pipe, 5½ inches, will be put in the main tunnel. The pipe is to be made by Brown & Ward, Downieville. Bedrock is figured to be from 16 to 18 ft below the main tunnel.

SHASTA.

FRENCH GULCH.—Cor. Shasta *Courier*, Sept. 10: The quartz mines and prospectors are going ahead just as they would were there no comet, taking out rich rock for winter and prospecting. The recent find by one of the McDonald Bros. on the Gibson Bros. claim, which was amicably arranged, is still prospecting hugely. Mr. Coesell is still on East Fork, and making expensee prospecting for quartz.

NEVADA.

WASHOE DISTRICT.

CALEDONIA.—*Enterprise*, Sept. 13: Pumps have been run an average of 7 houre per day, consuming an average of 4 2-7 cords of wood per day. At the Formau shaft we have extended the Sutro tunnel drift 35 ft. Will complete upraise from pump station to-day and complete bob station to-morrow.

OVERMAN.—South drift, 2275 level, has been advanced 19 ft. Have cut 143 ft of drain and put in 10 sets of timbers in north drift. No work was done on the 4th inst. At the Forman shaft the Sutro tunnel drift has been advanced 35 ft. Will complete upraise from pump station to-day.

SIERRA NEVADA.—The drift west from the 2700 level of the winze joint with Union Consolidated was advanced 17 ft. During the week have been cutting out drain and laying track in the east drift from the shaft.

POTOSI.—The crosscut has been advanced 20 ft. The last 28 ft being in a mixture of clay and porphyry. The best in the crosscut is intense.

CHOLLAR-NORCROSS-SAVAGE SHAFT.—The hydraulic pumps are running satisfactorily. The old pumps are still undergoing repairs.

GOULD & CURRY AND BEST & BELCHER SHAFT.—The shaft has attained a depth of 2,160 ft. Have stopped sinking and are now cutting out for balance bob No. 8 and stationary pump at the 2118 level.

CON. IMPERIAL.—Operations during the past week have been confined to the 2100 level, where preparatory work is being done looking to the reopening of the Imperial and Alpha joint winze.

HALE & NORCROSS.—Having extensive repairs to make to the incline and shaft, have stopped sinking the winze at a point 127 ft below the 2400 level. The bottom is in hard east country rock.

SUTRO TUNNEL.—Main tunnel, removed 19 old sets, 13 posts, 0 caps and 0 old drain boxes, and placed in position 30 new sets, 7 timbers, 10 posts and caps. The small sub drain being excavated between the Combination and the intersection of the south lateral with the main tunnel has been extended to the 10,100 point. The usual repairs on the track along the main line have also been made. At last report the south lateral branch had attained a total length of 3,500 ft from the Julia turning point. During the past week the header has been advanced 71 ft, making the distance now 4,721 ft, and the distance from the Jacket turning point 1,082 23; distance from the Kentuck south line, 495.89; distance of the header to Crown Point south line, 203 85, and to the Forman shaft 2,340 08. Vein at 4,035 point south lateral: The north prospect drift has been repaired, but has not been extended since last report. The south prospect drift has been advanced a total length of 26 ft. At a point 21 ft from the mouth of the drift a crosscut was started. On the left hand side of the face clay seams were cut, which indicate the immediate neighborhood of the vein. The flow of water from the main tunnel is equal to 5,376,960 gallons per 24 hours.

CANDELARIA DISTRICT.

NORTHERN BELLE.—*True Fissure*, Sept. 10: The shaft levels present about the same appearance as last week, showing no change either in quantity or quality of ore produced. In the 11th level a development has been made, showing ore 20 inches wide, which looks quite promising for opening into a good body. The section of the mine above the adit level is looking well and continues its usual yield. The development above the 4th looks full as well as a week ago. Other parts of the mine show no changes of importance. All work is progressing in a satisfactory manner, and about 88 tons of ore is being daily extracted and sent to the mills. Both mills are running steadily and doing the usual amount of work. Total bullion shipments on August account, $107,201.01. Shipments on September account to Sept. 7th, $14,502.43.

MOUNT DIABLO.—Winze No. 1, on the 3d level, shows no change. A drift has been started easterly from the bottom of winze No. 2, and the face is showing a 24-ft ledge of $40 to $50 ore. Winze No. 3 is down 72 ft, and presents no change from last report. The east drift on the 3d level looks very promising for opening, there being ore in most of its face. In the west drift, 2d level, there is an 18-inch streak of ore which assays from $80 to $75 per ton. On the 1st level, west of the shaft, a drift has struck a seam of very good ore, which is looking well and promising better for the future.

EDEN DISTRICT.

RICH SILVER OAKS.—*Silver State:* Wm. Hudson, of Golconda, has discovered a ledge in Eden range, some 12 or 14 miles north of that station, which carries silver ore that assays from $200 to $1,000 per ton. He is at work opening the lead, and the prospects of finding a good mine are said to be very encouraging. It is located in the eastern part of Eden district, which was organized a year or two since by Jas. Farrell.

EUREKA DISTRICT.

THE SATELITE.—*Herald*, Sept. 9: The owners of this mine are going to work in dead earnest to develop it. On yesterday the place for sinking the shaft was determined upon, and in to-day's *Leader* will be found an advertisement for proposals for sinking one of 8 by 5 in dimensions to the depth of 100 ft. It is in one of the most favorable locations in the district for opening up a paying ore body, and the work upon it will be pushed forward as fast as men and money can do it. It will be but a comparatively short time before the Satelite will create a sensation in Eureka mining circles.

THE BLACK HAWK TUNNEL.—John McKenna informs us that the Black Hawk tunnel, in New York canyon, is being worked steadily by himself and others, and that some very encouraging prospects have been encountered. The tunnel is located about 100 yards above the "Seventy-Six" Company's hoisting works. It is now in about 500 ft, and still driving ahead. At a distance of 365 ft a very promising ledge was struck, and the work is now in a kindly formation.

I X L DISTRICT.

ENCOURAGING.—Eureka *Leader*, Sept. 9: Jim Allen informs us that he has most encouraging reports from his claims at I X L district, in Churchill county. He says the Eastern Star mine, in which himself and other Eurekans are interested, has just been bonded to San Francisco capitalists for $12,000, and the prospects are the best in the world for a sale. He also says that the Bayfield and other claims in I X L are looking splendidly, and it is his opinion that the district is on the verge of quite a little boom. For Jim's sake and the sake of other Eurekans who are interested in the property, we hope that I X L will come prominently to the front.

ARIZONA.

SILVER DISTRICT.—*Sentinel*, Sept. 10: The assays from Lost mine are: No 1, $1,410.33; No. 2, average of unassorted waste dump, $11.33; waste dump, average, $9 42, silver, per ton. Average of entire shaft not yet taken. These are not fancy assays, but the average of what is coming from, and that which is in the shaft to-day. The Meeora mine is rapidly coming to the front, and the similarity of gangue and ore to Lost mine, is clearly defined, bold outcrop, and other favorable indications, pronounce it a mine of intrinsic value. The Canteen mine, (Frank Vomicil), and the first northwest extension from the Lost mine, will soon be opened by the owner, who with other property owners in that part of the district are enthused by the splendid prospect the Chicago Co have in their Lost mine; and development of the various claims will bring East Silver district into enviable prominence in the early future.

SILVER DISTRICT.—Globe *Chronicle*, Sept. 6: On the Black Rock 16 men are at work on the breast, opening a cut to sink a shaft. The force on the breast just north of "old Hayes' incline" shaft are in good pay rock, and the result consequent is the enlargement of the pay dump. A wagon road is being constructed across the mesa, around which the stage road now winds at Black Rock, to facilitate loading ores from that mine when transporting to the company's mill on the river. A rich strike in the largest body of milling ore proper, in quartz, yet made in the district occurred in the Loet mine, in cut No. 2, last week. Black sulphurets from the surface returned an assay of $309.25 per ton silver. First-class miners now get $3.50 per day and find themselves, and there is a demand for them at Black Rock mine.

TOMBSTONE DISTRICT.—*Epitaph*, Sept. 7: By courtesy of Supt. Church, the *Epitaph* has been favored with the result of the August run of 25 days, of the Tombstone Co's. mills, which, it will be seen, is but $5,758 short of that of June, the best run ever made in the district, and $8,487 better than July. The returns for the 3 months were as follows: June, $157,553; July, $143,308; August, $151,705; total, $452,656. Here is a showing that ought to satisfy the most exacting shareholder, and one that every person interested in the district may point to with pride.

The shaft on the Flora Morrison is now down 210 ft., and at 40 ft. deeper a station will be put in and crosscutting the ledge to the west will begin. Occasionally large pieces of ore fall out of the ledge, which looks remarkably well. Very promising developments are being made on the westerly extension of the main mineral belt. A strike has been made this week in the Elden Lass, showing at a depth of 90 ft. horn silver and ore assaying $3,500 per ton. The Belle also shows some $100 ore at a depth of 98 ft. A contract has been let to sink a 100 foot shaft on the Arizona May, a promising prospect owned by San Francisco parties, in the immediate vicinity of the Mamie and Junetta, both of which are looking well. The breast of ore on the 300 level of the Grand Central measures 35 ft wide, all of good quality. The incline at the bottom of the new shaft of the Stonewall is down 40 ft., which makes the total depth 90 ft. The cross-cut on the 50 level revealed 28 ft of ore. The Ingersoll is turning out ore as usual, which steadily increases upon the dump, that now has about 1,000 tons awaiting the stamps.

GLOBE DISTRICT.—Globe *Chronicle*, Sept. 9: Owing to the anticipated Indian troubles during the past week, and the excitement caused thereby, work on nearly all the properties has been temporarily suspended. We have not made our usual weekly trip among the mines, but learn from parties working in the Mack Morris, Stonewall No. 1, South Pioneer, Old Dominion, Borva, Alice and Eneline, that the ore bodies are looking larger and better than ever. Mineral Creek mill has been making a steady run ever since it first started up, but there being no fire arms available, the Superintendent deemed it advisable to shut down for a few days, in view of the probable Indian outbreak, and with the exception of two or three men who are guarding the property, all hands from the mill and mine came to town on Tuesday last, and will remain until the excitement, to some extent ceases. The services of Mr. Lamliss, one of the best amalgamators in the country, have been secured at this mill. He talks very encouragingly of the prospects, and says the mill is perfect in every detail, which speaks well for Supt. Cooper, under whose supervision it has been thoroughly overhauled and remodeled. The ore is yielding on an average from $30 to $35 per ton in silver, and there being an immense body in sight, there is no question but that the mill will be constantly supplied, and run to its fullest capacity, which will soon place the property on a dividend paying basis.

COLORADO.

SALE OF THE BAKER.—Georgetown *Courier*, Sept 8: We are reliably informed that a sale of the once famous Baker mine had been consummated this week to a party of New York and Philadelphia gentlemen at a large figure, and that a new company, with a capital stock of $2,000,000 has been organized to work it on an extensive scale. Besides the Baker claim the sale comprises the Argentuun, Elma, Grace H. Bell, Standard and Compromise lodes, which give the company about 4,000 linear ft on the main ledge. What was originally known as the Baker lode now comprises 3 lodes—the Elma, or south vein; the Baker, or middle vein, and the Argentum, or north vein, all 3 of these veins having formerly been worked by the old Baker company.

THE A.-P. TUNNEL STRIKE.—From Dr. McKenney, the superintendent of the west end of the A.-P. tunnel, who came over from Chihuahua last Saturday, we learn that the recent strike continues to show improvement as the developments progress. The drift on the lode is now 60 ft long, and shows an ore vein that is continuous. Since our last notice 18 ft have been driven, and the vein of solid smelting ore has increased from 15 to 30 inches in thickness, and a late assay shows its value to be 51 ozs of silver and 9-10 ounce gold per ton, and 61¾ lead.

STRIKE ON WILLIAM'S FORK.—Indefinite reports have reached town regarding a big strike of ore on William's Fork by Thos. Webb and John Sanders of this place. The boys have been engaged at driving a crosscut tunnel for one of their lodes, which on Thursday of last week, at a distance of about 60 ft, intersected a very large body of smelting ore.

CAMP CLIFFORD.—Camp Clifford, situated at the head of York gulch, which was not known as a mining section until within the past 2 years, now boasts of 3 paying mines. The main shaft on the Clifford is down to a depth of 175 ft, and sinking and drifting are both going forward. There is a large amount of ore on hand in the shaft-house, which will mill 500 ozs of silver to the ton. The Ranchman is the extension of the Clifford, and is owned by Robert Thompson, of Chicago, and Jerry Quigley, of Loveland.

DAILY DISTRICT.—Clay and Mart Cowles & Gus Williams have recently located a number of claims in South Dally, near the Mountain Ram and Ruby lodes, all of which show good streaks of high-grade ore, assaying from 200 to 1,000 ozs of silver to the ton. All of the lodes in this locality show very high-grade ore, and development is all that is needed to make them pay.

DECATUR.—It is reported at Decatur that the Chihuahua concentrating mill, which was recently bid in by Mr. C. R. Fish, of Georgetown, is to be run in the future as a sampling and ore purchasing establishment by Mr. Fish and L. W. Aldrich. If this is done it will be a great benefit to the miners of Peru district, for it will make a market for small lots of ore and induce prospectors to develop their claims.

The latest thing is the talk of a new town at the forks of the creek, 3 miles below Chihuahua and 2½ miles below Montezuma. The railroad has been surveyed up to this point, and it is expected that it will be completed before winter, and as there is no immediate prospect of its being built beyond that place it will probably be the distributing point for that section. Messrs. Mitchel, Squires and Greer have already made arrangements for the erection of a 3-story hotel. They have the lumber on the ground, and are now grading for the building.

SOME of the mines on Lenawee mountain are turning out very rich ore.

DAKOTA.

RUBY GULCH GOLD.—Black Hills *Miner*, Sept. 3: Mr. Moll, an old miner, exhibited a sack full of gold nuggets that were taken from Ruby gulch. He says that since the discovery there has been over $20,000 in coarse gold taken from the Ruby gulch. Ed Collins has been at work for a long time with a force of men building a ditch and flume across to convey water for hydraulic purposes to these diggings.

THE Sitting Bull mine is shipping to the Omaha smelter a ton of ore a day, and this ore is supposed to mill not less than 600 ozs a ton. There is now on the dump of Sitting Bull 1,500 tons of ore that will go 100 ozs to the ton. The Red Jacket is taking out ore and preparing for shipping it to Omaha that will average 130 ozs to the ton.

FRANK BRYANT, superintendent of the Aurora mining company, came in from the carbonate camp last evening, and is full of hope for the future of that district. He says he has assayed ore that came from the Wilkinson mine that went $1,354.44 per ton, and he regards that as tolerable rock. It only requires development in his opinion to make the mines of that camp bonanzas, and Frank is one of the miners that will stay with it to the end.

A MEETING was held at West Virginia the other day, and it was made a rule by the miners that in the $100 that must be expended in labor each year on each claim that a full day's labor should be $5, and the work must be a faithful 10 hours' labor each day, and should show for itself. The office of recorder for the district was abolished, and instead Mr. Redpath was elected Secretary.

MONTANA.

CLEAR GRIT.—*Inter-Mountain*, Sept. 7: This very valuable property, situated north of Butte in the immediate vicinity of the Acquisition spur, is being put in shape by its owners to develop it to a depth of 500 ft without delay. It now has a shaft sunk on it to a depth of 58 ft, and has already yielded over $41,000 at that depth. The Clear Grit M. Co are getting machinery of the best manufacture, and are erecting a large shaft house, similar in design to that of the Stevens. The pitch of the Clear Grit is about 60° to the southwest, and it promises to be one of Butte's standard bullion producers.

MILLS AND SMELTERS.—The old Alice mill, after a thorough overhauling, was fired up again on Monday and is now pronounced as good as ever. On the southeast corner of the new Alice mill a big building is in process of erection, in which, when completed externally, a Bruckner furnace will be erected. Its chloridizing capacity will be almost as great as that of a 60-inch Howell cylinder, and its cost considerably less. On its completion it will be no longer necessary for any of the stamps to work on free ore as the capacity of three furnaces will be amply sufficient to provide for the chlorination of all the ore which 60 stamps can crush. The operation of the additional furnace will result in an increased bullion product, the fineness of which will be greater than heretofore. The percentage of chlorination in the Alice mill yesterday was higher than ever before, being 97.41. The tailings assayed only 44 cents. What mill on the Pacific coast working on base ore can beat that splendid showing? The Moulton 40-stamp mill is fast approaching completion. The pans and settlers, the two revolving dryers, one of the roasting furnaces and the battery timbers are all in place. The other furnace is almost finished and the stamps will be hoisted within a few days. The mill will not start until immediately as the water ditch from Yankee Doodle will not be ready to convey water for about a month. Excavation for the Lexington mill is proceeding as rapidly as possible, and the contracts for its construction have nearly all been let. The main building of the Bell smelter is already looming up, and the brick-work will begin without delay. The group of mines lying north of Walkerville are nearly all in process of active development and are showing up some fine ore bodies. Explorations on the 300 level of the Bell are prodneing as usual, and the ore body looks better than ever. The correctness of Prof. Clayton's report on the property is now readily conceded by all who examine the mine. The Alice mine is in splendid shape, and the same may be said of the Magna Charta, in which the north and south 300-ft crosscuts are opening up immense bodies of ore. The Bell of Butte is yielding a large amount of good ore, which is being shipped for reduction to Silver Bow mill. The main shaft of the Star of the West has attained a depth of 180 ft and sinking actively progresses. The recent improvement in the quality of the ore continues and the drifts which will be extended on the vein at a depth of 200 ft are expected to open up a rich body of smelting ore. The lessees of the Bummer are realizing a handsome profit from the property. Crosscutting from the bottom of Orey Rock shaft is vigorously prosecuted. The main ledge at a depth of 72 ft was 23 ft wide, as opened up by a south crosscut from what is called the west shaft. Fifty ft nearer the surface it was but 8 ft wide, and if the rate of increase should continue, the ledge when tapped from the 300 station will show the largest body of ore ever uncovered in the district. On the Lexington splendid headway is being made in sinking the main shaft, the energy displayed in the work being well worth emulation. In the old workings operations are confined to the extension of the drifts from the bottom of the 70 ft winze sunk in the 60 level under shaft No. 2. A magnificent body of high grade silver ore and assaying well in gold is being explored.

OPERATIONS.—*Inter-Mountain*, Sept. 9: The mining boom which has lately struck Butte is based on the indisputable richness, extent and prominence of the finest group of mines on the continent, and is constantly increasing with the investment of capital, which is directed to this great camp by the favorable reports of all intelligent men who have examined into its resources. The latest big mining operation to report is the bonding of the Moose for $75,000. This promising property lies a few hundred ft south of the east end of the Magna Charta, and is developed by four shafts, the deepest of which is 90 ft. It is owned by Farrer, Johnson & Larabie, and the bondees are John Longmaid & Co., who, it is presumed, are acting in the interest of Eastern parties. It is also reliably reported that Joseph Lacaff has sold the remainder of his lease on the Anselmo, which expires in March next, for $20,000. The Anselmo still shows an abundance of ore between the 400 and 500 levels, and there is little doubt that the purchaser has made a good buy. One year ago Mr. Lacaff was offered $40,000 for his lease, which, fortunately for himself, he refused. The Right Bower, a prospect lying some distance northwest of the Alice, has been bonded by its owners, Peter McMahon & Co., to Charles Cellis and others for $25,000.

IDAHO.

THE QUARTZBURG MINES.—*Idaho Statesman*, Sept. 6 From Mr. Maddox, who came down from Quartzburg on Friday last, we learn that the owners of the Confederate claim (Callahan, Quinn, Bryan and others) have struck an ore body about 3 ft thick, and full of free gold. The long existing difficulty between these parties and the Gold Hill Co. has been compromised by an agreement by which the Confederates take all the ground above water level in the gulch, and the Gold Hill Co. take all below it. A crushing of about 150 tons of Confederate ore made recently at the Gold Hill mill, yielded a trifle over $25,000, or an average of $166.00 to the ton. This is the work of 0 mens since last October, and the great hight of the mountain gives abundant proof that the ledge is of ancient formation. The Gold Hill Co. has shown good sense by keeping out of litigation. Taking the entire outlook, it is a good one for Quartzburg, which bids fair to become as important a quartz camp to Idaho as Sutter Creek is to California.

ANOTHER LUCKY STRIKE.—Wood River *Miner*, Sept. 10: E. D. Browne and J. Fox formed a partnership about a month ago, and went up the river a short distance above the smelter to prosecute the business of burning lime. They settled in Greenhorn gulch, and located a claim accessible to timber and good lime rock. The quality of lime gave satisfaction, and soon a brisk business was in operation. In getting out 100 tons of lime rock, to be used as flux by the smelter, Mr. Browne struck a body of ore 5 ft thick, consisting of carbonate and galena. Good indications appeared about a week ago when a seam of iron was struck, which induced Mr. Browne to stake it off. Last Saturday the bonanza showed up. An assay realized 100 ounces silver. Mr. Browne intimates his intention of retiring from the lime business and following up his new bonanza.

OREGON.

GALICE CREEK.—*Democratic Times*, Sept. 9: Walter Simmons and Lewis McElvey have purchased a claim on Galice creek and will commence at once to put it in shape for winter. A clean-up was made at the Applegate Gravel M. Co.'s diggings, managed by Dan Silva, last week. Several hundred dollars in gold dust was the result. Benner & Co. have manufactured a large amount of flume lumber at Big Butte for the Centennial mine and propose inaugurating extensive operations next winter. Tunnelling is going on with encouraging results. Several men are now engaged in putting the Squaw Lake Ditch to rights in order, and operations may be resumed next winter. A new dam is being put in at the head of the ditch, which is also being cleaned out, and the bulkheads will also probably be replaced at an early date. It is reported that Richard Hadley discovered a fine quartz ledge on Steamboat a few days ago, that prospects exceedingly well and promises to be of good size. Some of the ore has been pounded up and proved quite rich. John Bolt is interested in the discovery. Some excitement exists on Applegate in consequence thereof.

UTAH.

SILVER REEF.—Salt Lake *Tribune*, Sept. 6: We learn from a gentleman just from Silver Reef that the prospects of that mining camp were never brighter than now. There is a fine strike made in the Savage shaft of the Buckeye property of good ore. The strike is in the bottom of the shaft, 275 ft from the surface, and seems to be a continuation of the ore bodies of the Buckeye. This shaft was not started on any vein, and had nothing to follow from the top. But, previous to the strike, small pockets of ore were found from time to time in the rock. The discovery is of especial value as domonstrating the presence of good ore at a greater depth than heretofore found in that portion of the Reef. The strike in the Savage is of great value as showing the continuity of the upper ore bodies with the lower, and substantially making just so much of an ore reserve upon which calculations of present value may be based. In the same direction is the result of the prospecting in the old Leeds Co's works. Developments have been making without cessation in their ground, and now with the price of labor, the miners are now working at $3 per day for surface bounds, $3.50 for underground work, and $4 when the water is troublesome.

The New Mines in Antelope Valley.

The Bridgeport *Union* (Mono county) eays: On Wednesday, while in Antelope valley, we thonght we would visit the new copper mine the Antelopere are so much exoited over, and satisfy ourselves as to its merite. The Unole Billy is located in a gulch that makes into the canyon from the west. A roomy seven-foot tunnel has heen run in about 30 ft. on the east side of the ledge, the breest of which showe a strong ledge of good copper-bearing ore. Wc found on the dump many fine pieces of the red oxyd, and some of gray and black, hut the bulk of the ore appears to he of the red oxyd quality. The ledge looks nnusnally promising so near the croppings—only 400 ft. helow the crest of the hill. The tunnel will be continued 50 ft. further, when a winze will he eunk 50 ft., at which depth the ledge will he cut, when it is thought a paying eilver mine will be developed, as ore taken from the present workings assayed $17 in silver, a trace of gold, and very high in copper. It is the best prospect we have seen in many a day, and were it in Arizona, Sonora, Mexico, Siberia, Alaska, or a like God-forsaken oountry, Sau Francisco and Eastern capitalists would outbid each other to obtain possession of so promising a piece of mining property; hut the Uncle Billy is in one of God's favored countries, where the snow-fall ie light and would never retard mining operations or prevent free access to the works during the most inclement winters; where there are eligible eites for all the necessary reduction works, and for a town, and where wood and water, and all the necessaries of life—for man or beast—can be had in the greatest ahundance, and it may not attract the attention of capitalists until its greater development places it among the valuahle minee of the conntry. The work is being done hy C. W. Honeycutt and T. J. Baker, who recently returned from Arizona and Sonora, they having taken an interest in the mine, having great faith in ite prospective value, the other principal owners heing William and Henry Rickey and Geo. Chichester, all of Antelope valley. A number of locations have been made on the Uncle Billy ledge, and a parallel ledge, known to he the extension of the Walker river copper mines, which are being successfully worked, has also been taken up hy the Antelopers. It is notorious that the entire section is fnll of mineral—silver and copper, and we advise our prospectors to visit that section. The mines are just over the State line, in Douglass county, Nevada, and a natural road runs through the canyon from Antelope to Williams' on the Sweetweter road, but the natural depot for supplies will he Antelope valley, and the people of that favored valley—the garden spot of Mono—should all take stock in the Uncle Billy and assist in its development, for there is a splendid prospect for a good mine, and the people of Antelope will receive the greatest benefit from it.

New Dams in El Dorado.—The dams being constructed hy the Cal. W. & M. Co. at Loon Leke are composed of granite, and tbe works are of a character to do service for ages. The company are certainly making all of their improvements of a suhetantial and lasting nature. The winter following the present company's pnrchase of this promising property was one of the eeverest ever experieuced by ditch owners in the mountains of California, and the manager, Mr. Findley, in common with the leading men of the company, has determined that euch a disaster shall never visit their property again, and further, they are building the dams of such dimensione as to increase the water reserve sufficient for all future wants of this divide and the city of Sacramento besides, which the company may have the opportunity of supplying in the near future. The object of these immense reservoirs located at an altitude of more than 6,000 ft. above the eea, is to store an abundance of water from the vast accumulations of snow, as a reserve for the dryer portion of the seeson, when the supply from other streams begin to fail. The course being pursued by the management appears to us a judicious one, and there is nothing to prevent, with honeet management, this becoming a handsome dividend paying property in the near future. In a few weeks we will try and procure a statement of the progress made by the company since the property fell into their hends. —*Georgetown Gazette.*

Very few people have any idea of the space required for the storage of the money now in the hande of the Sub-Treasurer. The basement vault ie about 17x35 ft., and 9 ft. high. Thie ie full. There are two vaulte on the main floor, about 8x8 ft. and 10 ft. in the clear, and these are nearly full. There is probably room for only $1,000,000 more etandard dollare. You can etore $20,000,000 in gold in the place of $1,000,000 in eilver. There is 490 tons silver now on deposit there, mostly in etandard dollare, a portion ef which is repreeented by the eilver certificatee in circulation. Silver coins that have been in circulation show a loss by abraeiou, ae compared with new coin, of $13 in every $1,000. Congress hae made no provieion for redeeming abraded eilver coin.

Herr Krupp, the great German gun-maker, is eo preseed with orders that he has engaged 8,000 more workmen, making the total force of workmen 13,000.

Gold Park Mines.

M. San Pedro, manager, writes to the Grantsville *Bonanza* as followe, about the Gold Park mines, Nevada:

Last week we struck very rich ore in the Star of the West tunnel. We have heen running a drift in the Star of the West tunnel for some time; it is now 100 ft. eouth from the tunnel, shnwing all along fine carhonates two and one-half ft. wide, averaging ahout $100 in gold, $40 in silver, and from 18 to 20% in lead. At this point, over 100 ft. south from tunnel and over 100 ft. to the eurface, both mines, Nos. 1 and 2, come together, and the ledge is now over three ft. wide. Here we have connected with incline of No. 1 Star. Keeping the drift to the south, on the ledge and just under the incline, at 100 ft. from the surface, have started a winze, and from the level of the tunnel dowu the mine is showing galeua with carhonates rich in gold. An average assay from this place, made by Mr. T. Price, of San Francisco, gave the following results: Carbonates—$158 in gold, $33 in silver and 19% in lead. Galena—$4 in gold, $171 in silver, and 68½% in lead. Of these ores we have over 100 tons in dump, taken out simply in running this drift. Since this new strike of smelting ores I have brought all my men from the Arctic series, which mines are of free milling ores very extensive and rich in gold. Of these I will write some other time; but I see more money in the smelting ore of the Star of the West series for the present, so I bave brought all my men, 12 in number, to the new bonanza, our object heing to find its extent.

It looks very etrange to see in this formation, viz., porphyry and syenite away from the contact of lime, for these mines to produce emelting ores of the highest degree. I confess the truth, in all my experience all over South America, and here in the United States, I have never seen a case like this; hut this may be another wonder in the mineral world.

Now, Mr. Editor, I see you have done justice, through your paper, to this promising distriot, aud also stopped some growlers, who were uttering words of discouragement ahout Gold Park mines. Let them growl! Bsfore long nature will make them retract their own words with remorse.

Cheese and Rheumatism.

The results of my observation and expsrience of the ill effects of cheese, particularly when taken in laige quantities, may he intersstiug to some readers. My attention was first directed to this snhject in 1871, through reading a pamphlet in which the writer, a medical man, stated having observed that large numhers of persons in certain localities suffered mnch from rheumatism, chiefly in the limbs. On inquiry he found that cheose entered largely into their bill of fare, and subsequent ohservations led him to the conclusion that it was to a large extent the cause of their pains. Being fond of experiment, I put the matter to a test, as I remembered having suffered similarly eome years previously, and at a time when I had heen taking cheese. I commenced with a supper of hread and cheese, and after a week or ten days, as near as I can remember, I experienced pains in the limhs similar to those caused by having wet feet. The pains were chiefly confined to the thighs, and were continuous when moving ahout during tbe day, though not experienced when lying in hed. Some yeare afterwards, when eerviug in a grocery store, a young man half my age (I was 40) complained to me of pains in the limhs, with an indisposition to exertion. I at once told him if he would let cheese alone he would he all right. He followed my advice, and experienced in a few daye en entire cessation of pain. He again and again returned to the practice, but always with the same resnlts. Having been lately again indulging too freely in the use of cheese, again the results ahove given followed, and I have just recovered hy ahstinence from cheese. I find that I can digest haked or toasted cheese hetter than raw, and can eat more of it. Can any medical friend give us the *rationale* of this eubject?—*Herald of Health.*

Construction of Mining Law.—The Commissioner of the General Land Office puts the following construction upon Section 2,336, U. S. Statutes, "where two or more veins," etc.: The uniform construction placed upon this section is, that the epace of intersection meant, is determined solely hy the width of the intersecting veins, and not by the width of the claims. For instance, the party making the first location is entitled to all surface ground and the full extent of the vein included within the boundaries, inclnding the space of intersection. The second locator is entitled to the full length of his location, exclusive of the conflicting surface ground, and the epace of intersection of veins. If the intersecting veine are respectively 10 ft. in width, the epace of intersection would he 10 ft. square and the party locating last would not be entitled under the law to 10 ft. of lode included in the space of intereection.

Magnificent Assays.—The Safford district is ehowing better with every etrike of the pick. Eight assaye from the Onondaga mine, made by C. Wiegand & Co., of Virginia City, resulted as follows: No. 1, $160; No. 2, $366; No. 3, $160; No. 4, $576; No. 5, $184.40; No. 6, $91.20; No. 7, $167.20; No. 8, $294.40. The proprietors now claim to have eix ft. of this high-grade ore. —*Eureka Sentinel.*

Charles Dickens Bullion.

August 19th, received from the Charlss Dickens mine, per Pacific express company, at Challis, four bars bullion, weighing 124 lbs., value $3,000. This rich and immense mine is constantly sending out her treasurss to the world. We have intended to publish her shipments regularly, hut one accident and then another caussd the omission. We have no pet mines, and if we had, most certainly one of the grandest and best in this or any other portion of the world would be one of them. We shall he glad at all times to encourage the working, development and financial success of each and every true mine. We do not want to know of, or hear of, "wild cets." They damn a country, and help only knaves—for only knaves would profit by the criminal management of them. Swindlers, managing in a swindling manner, mines, have done more to make the capital of the world coy than ever weak mines did. Mining is a legitimate business, and, honestly and honorably conducted, we have a proud and almost limitless field in which capital can operate. But in all the veins and placers where we have ever heen—in California, Oregon, Nevada and Idaho—we rarely, if ever, saw a mine, with so little development in it, and so little machinery attached to it, that gave such proud promise and euch ahundant production as the Charles Dickens. It might well be named by its discoverer, William Norton, after one of the greatest of men.—*Challis (Idaho) Messenger.*

Misrepresented.—It was currently rumored on the streets Wednesday, that a collusion had been entered into betwesn the Miocene, the Gold Run, and tbe hydraulic mining companies that have not bsen enjoined, hy which the two former companies were to delay the suits against them now pending in tbe courts, for which they were each to receive $20,000 per month from the other companies, who continued working. A reporter called on Major McLaughlin, who denied the rumor in toto, stating that tho Miocene company was doing everything possible to bring the case to a speedy trial and have the question settled; that a large amount of money had been invested in the property, and they wanted a decision hy the courts as to whether they were or were not to be permitted to develop it and get some return on the investment; that $15,000 or $20,000 a month would not compensate them for delaying the suits. The Major also said that among other misrepresentations circulated about the Miocene company, was one to the effect that they had been running 3,000 inches of water into the river, and that they had 1,500 acres of land for hydraulicing purposes. The fact is that up to within a week of the time they were enjoined, they were unable to run even 1,000 inches of water, and during the last few daye that they worked, they only managed to run ahout 2,000 inches; and all the land they hold for hydraulicing purposes does not exceed 500 acres.—*Oroville Mercury.*

Death from the use of Anti-Fat.—Much excitement has been caused in northern Ohio over the recent death of the wife of C. R. Griggs, lessee of the Wheeling and Lake Erie railroad, cansed by using the medicine known as "anti-fat." The following are given as the facts of tbe case:—On the 11th of Angust Mr. Griggs and his wife engaged a suit of rooms at a hotel, both being, apparently, in perfect health. On the morning of the 13th a servant, entering her room, found her lying in a swoon on the floor. A doctor was summoned, but all his efforts to bring her out of the comatose state into which she had fallen were fruitless for a long time. Mr. Griggs finally telegraphed for Dr. Soss, of New York, the family physician. For awhile both doctors were puzzled, and pronounced the case one of erysipelas. Mrs. Griggs was very etout, and Dr. Soss, learning that she had heen taking an anti-fat medicine, hegan treating her for hlood poisoning. In her lucid moments she told Dr. Soss she had taken 18 bottles of the anti-fat medicine in ten months. Recently she became ill and had discontinued its use. Once bsfore Mrs. Griggs was taken sick after using this medicine, and the doctor, after great trouble, succeeded in giving her relief. He told her that the continued use of the medicine would certainly canse death, and supposed she had stopped using it. The combined efforts of both physicians to save Mrs. Griggs' life were of no avail.

A New Theory of the Cementation Process.—Mr. R. Sydney Marsden has brought forward, at a meeting of the Chemical Society, what he claims to be a new theory of the cementation procese for the conversion of wrought iron into steel. He hae observed that when amorphous carhon in an impalpable powder is kept in contact with porcelain at a temperature conaiderably above rednees, but not sufficient for the latter to become fused, the carbone will, if left for a number of hours, diffuse into the porcelain and ultimately permeate it throughout. He considers the conversion of wrought iron into steel by the cementation process as analogous to this—that is to eay, the result of diffusion of carbon in an impalpable powder into the bars of iron while they are in an expanded or softened state.

Mr. Wm. B. Hyde, Superintendent of the Custer mine, Idaho, has honded the North and South America mines in the Yellow Jacket district, and has sent a party of men over to work them.

A Pleasure Trip.

Just at this season of tbo year ono of the finest and most agreeablo trips to he made in the State is that offered by the counties of Napa, Lake and Mendocino. Taking the Vallejo route, go to Napa and Calistoga by rail; from there by stage to auy or all of the following springs: Anderson, Adams, Siegler or Highland; then to Soda Bay; theuce hy boat on Clear lake to Lakepor; by stage to Wilter and Piersen's springs; a day or two at Blue lakes; stage to Ukiah, and then to Mendocino through the far-famed redwood region; visit the mill at this place, where they daily turn out 50,000 ft. of lumher; thence hy the Pacific Coast steamship line to San Francisco. We know of no round trip that will give one a better knowledge of the Coast range than this, which is full of picturesque scenery from heginning to end; good hunting and fishing anywhere along; dotted every few miles with medicinal springs, affording good stopping places at almost any epscified distance so that ono may lay over in comfort when weary. Soda Bay is a wonder of nature; Blue lakes are beautiful, cosy and health-inspiring, with fine fishing, hunting, hoating, and the finest well of water in the State. The ride from Ukiah to Mendocino is all the way through dense redwoods, here and there deer jumping out of the way of the stage; huckleherries lining the road, and occasional glimpses of the vastness of the forest, and beyond the deep, placid, rolling Pacific, had from the summit of eome bare peak around which the road winds. At Mendocino one may cruise up and down the river trolliug for salmon, whipping for tront, wandering into the solitude for a deer, or gathering shells on the heach. Such a trip gives spice and variety to life, and adds to ono's knowledge of tho resources and beauties of our State.

Died With Their Boots On.—The names on most of the head-boards of the men who died with their boots on, and were huried at the lower end of town, have been obliterated hy the weather, and those warriors, the mentioning of whose names always bring to memory the early and prospsrous days of Pioohe, when mining companies maintained young armiee and the minere went to their lahor with 16-shooters on their shoulders, aud we used to have lots of nice big funerals, with banners flying and music playiug, now sleep in unmarked graves in the City of the Dsad. The heed-hoard at the grave of Jack Harris, the noted stage-rohher and road agent who Wells, Fargo & Co. paid $250 per month to keep off of tho road, has escaped the inclemency of the weather and the lettering appears as perfect as that on hoards placed at the head of graves hut a few short months ago.—*Pioche Record.*

The Idaho *Statesman* wants to know how is is that no company has heen organized to work the hars on Boise river, hetween that city and the old ford 12 miles above. All the tributaries of that etream above here have paid enormously, and men aro now living in three-story houses in San Francisco and Oakland, who came into Boise basin afoot and lived on sowhelly and heaus. These hars ought to he as rich as those on Snake river above the American falls, and wherever proper machinery can be had to save the fine gold that has heen lodging there for the past 18 yeare, they will pay enormously. If rocker mining helow Umatilla, on the Columhia, will pay $1.30 to the hand, the hsrs along the Boise ought to pay three times as well.

Spring City Notes.—A note from Spring City, in the *Silver State*, eays: "The town is unusually quiet, and money scerce. Two of the principal mines being bonded to outside perties, work on them is suspended for the present. The mines are in splendid condition for producing ore, of which there are several tons in sight. The Red Deer mine is showing up well. A shaft is heing eunk on the vein in the tunnel, and the ledge is large and liahle at any time to opsn out into a honanza. Tho Big Nick and Live Yankee, in the vicinity of the Bullion, are good prospects, and it is to he regretted that some compauy with means to develop tbem dose not take hold of them."

The Angular Distance of Color.—The determination of the angular distauce of colors, whatever that may be, was made the subject of a paper submitted to the Academy of Sciences of Paris, on July 25th, by M. Rosenstiehl. The colors—orange, yellow-green and blue—have the characters of a triad or of producing the visual eensation of white when mixed with equal intensity. All the colors which occupy the angles of an inecribed equilateral triangle have the same properties.

Pennsylvania District.—A. J. Blair, Superintendent of the Hillside, and Jas. R. Duff, Superintendent of the Meadow Valley mine, paid Pennsylvania District a visit the other day. It is a well-known fact that there are eome very promising mining property in that district, and we would not be astonished to hear of a little prospecting being done on some of the claime.

M. C. Taylor ie developing a fine ledge of iron ore below the Lime Kiln, 18 milee south of Grass Valley. Copper is also found in large quantities, commingled with iron.

The Engineer.

Engineering Enterprise.

The present century will be prominent in the annals of engineering. The world seems smitten with a craze for piercing isthmuses, boring tunnels, constructing bridges and kindred undertakings. At home, our hands are full of such schemes; but the people of the Old World appear to be especially under the spell. The Alps are being pierced by tunnels under the St. Gothard and the Simplon, while designs are made for burrowing the base of the mighty Mount Blanc himself. What is known as the Chanel tunnel, between England and France, is, so report says, progressing favorably; and the same spirit of enterprise, which, goaded on by the brilliant success of the Suez canal, is scratching the Isthmus of Panama, is also persuading engineers of the expediency of opening a new entrance to the Mediterranean, now entirely monopolized by Gibraltar's strait, by means of a waterway from Bordeaux to Narboune, at each of which porte there is an excellent harborage for vessels of every description.

Those who do not carry a map of the world in their heads may see by a glance at a chart of Europe that there are benefits likely to accrue to France and other European nations by carrying out this scheme, and that there are also the reverse in the event of a general struggle throughout Europe. The fact, too, that the Garonne may, with comparatively little expenditure, be made navigable as far as Toulouse—two-thirds of the distance of the proposed canal—divests the scheme of no inconsiderable amount of its weightiness.

Much of the opposition to these projects is needless; but it would be a wonderful venture indeed that was hailed with unalloyed enthusiasm. Perhaps no undertaking was ever more bitterly opposed at its inception than the Suez canal; and those who showed themselves most hostile to that enterprise lost no time in acquiring nine-tenths of its stock as soon as the speculation proved profitable.—*Cincinnati Commercial.*

Testing the Hudson River Tunnel.—A test of the strength and soundness of the completed portion of the Hudson River tunnel was recently made. The new air locks at the river ends of the borings were closed and the air pressure was gradually reduced in the portion between the locks and the shore. The test was satisfactorily borne, except by the unfinished part between the locks and the heading, about 30 ft. in length. The escape of air from this portion by leakage allowed the silt to press in, crushing several feet of the iron shell which extended beyond the brickwork. The workmen had been withdrawn from this part of the tunnel before the pressure was reduced, and, except for the derangement of the extremity of the tunnel next the heading, and the pressing in of silt, no harm was done. This difficult engineering work is still progressing successfully, notwithstanding the opinion of numerous engineers that the method employed of preventing the admission of water by keeping the excavation filled with compressed air was not practicable. Since the disastrous accident some months ago, resulting in the breaking of the air lock and the flooding of the tunnel, causing the lose of many lives, there has been no further trouble with the work. Both the tunnel ways are being pushed simultaneously, and it seems very certain that ere long railway trains can be run from Jersey City directly to New York.

Improving Charleston Harbor.—Government engineers are at work endeavoring to improve the harbor of Charleston in the same manner as the mouth of the Mississippi was deepened—by jetties. This work is proceeding with commendable energy. On July 1st the foundation for the jetty on the north side of the harbor had been carried ont 12,000 ft. from Sullivan's island, and during July about 600 ft. more were completed. Some 5,000 ft. must yet be added before the foundation of the north wing of the jetty is completed. The foundation of the south jetty has been run ont 6,000 ft. from Morrie island, and it must be extended 12,000 ft. farther. Capt. Green, who ie in charge of the works, thinke it can be completed within 18 months. The jettiee so far have made no appreciable changes in currents of the harbor or the depths of the water.

The Arlberg Tunnel.—The boring of the Arlberg tunnel is proceeding with great rapidity. The length finished since June, 1880, is 1,720 meters, and an average yearly advance of 2,160 meters is confidently expected after a while. The avorage of Mont Cenis and the St. Gothard wae only 1,112 and 1,670 respectively. The St. Gothard tunnel will be completed by the end of Septemher, but the lines of approach are not likely to be ready before next spring.

A Ship Canal across the peninsula of Maryland and Delaware, shortening the distance hy water from Baltimore to the Atlantic, ie an old project; but now it is to be speedily carried out, the necessary $8,000,000 having heen raised.

Eucalyptus Leaves for Tobacco.—A Paris manufacturer claims to have discovered a process for substituting the leaves of the eucalyptus tree, which in burning emit n delicious perfume, for tobacco leaves in making cigars.

Useful Information.

Composite Portraits.

A composite portrait is something new in the art line. At the last meeting ot the Photographic Society of Great Britain, Mr. Francis Galton, F.R.S., read a paper on "Composite Portraiture," in which he stated that his attention was first directed to the subject some years ago, when he found that, by taking two or more portraits of different individuals under exactly the same conditions, and superimposing them, the features, if not absolutely dissimilar, blended together and formed an idealized portrait, which could be well seen when the image was thrown upon a magic lantern screen. The registor he adopted, so that the features should be identically superimposed, was by drawing a horizontal line through the eyes, another parallel to this through the mouth, and a third, perpendicular to and bisecting these horizontal lines through the nose. The point of bisection between the eyes was that which he was especially careful to maintain in the same position in each portrait. Mr. Galton's first method of producing composite portraits was hy means of a copying camera, paper positives being used. He now, however, used transparancies, and he exhibited and described the apparatus which he had adopted for the purpose.

One purpose for which he believed composite portraits would he valuable was that of producing a standard physiognomy of disease. With this object he had taken the portraits of consumptive persons, male and female, and had combined them; and it was remarkable how a certain average of faces was found to be almost identical. Mr. Galton also exhibited a number of what he called typical portraits. One was the face of an idealized criminal formed from a combination of seven portraits of criminals, others were the faces of consumptive patients, and a third series was that of the portraits of officers and men of the Royal Engineers. In one case he had combined the portraits of twelve officers, in another the portraits of eleven privates, and in a third he had combined the portraits of officers and privates. In each instance Mr. Galton said the individuality marking each class was strongly brought out and idealized. He also pointed out how, in every cass, the idealized portrait was better looking than the faces from which it was made.

To Extract Oil from Herbs.—The volatile oils are generally obtained by distilling in a deep narrow retort the articles along with an equal weight of water: but some substances that give out their oil with difficulty are first soaked for twenty-four hours in twice their weight of water, to each gallon of which one pound of common salt has been added, by which its boiling point is raised, and consequently the oil comes over more readily. The distillate sepsrates into two layers, the water being drawn off and returned to the retort, and this is repeated until distilled water ceases to come over mixed with oil. The rectification of the oil is performed without water, by the careful application of heat, just sufficient to cause them to flow over pretty rapidly, so that they may he kept heated for as short a time as possible.—*Scientific American.*

Facts Convenient to Know.—The following facts are well worth remembering, as they will save a great deal of calculation and give approximately accurate results with minimum labor:

A cord of stone, 3 hushels of lime and a cubic yard of sand will lay 100 cubic feet of wall.

Five courses of brick will lay 1 foot in height on a chimney. Nine hricks in a course will make a flue 8 inches wide and 20 inches long, and 8 bricks in a course will make a flue 8 inches wide and 16 inches long.

Eight bushels of good lime, 16 bushels of sand and 1 hushel of hair will make enough mortar to plaster 100 square yards.

One-fifth more siding and flooring is needed than the number of square feet of surface to be covered, because of the lap in the siding and matching of the floor.

One thousand laths will cover 70 yards of surface, and 11 pounds of lath nails will nail them on.

One thousand shingles laid 4 inches to the weather will cover 100 square feet of surface, and 5 pounds of shingle nails will fasten them on.

Matrimony Tart.—Pare and core a dozen apples; put them into a saucepan with a little water to keep them from burning; boil them until you can pulp them, but do not forget to frequently stir them; then add quarter pound of currants, two ounces of candied lemon peel, and enough sugar to sweeten it nicely; if liked, also a little grated nutmeg. Pour this mixture into a large dish that has previously been lined with a thin paste. Then roll out another piece the same size and thickness, which place over the top; press the edges together all round, make a hole in the center the same as for mince pies, and hake.

The Best Oil for Rubber Belts.—A correspondent of a mechanical paper says: "I have run many rubber belts, and after trying various articles had the best success with hoiled linseed oil. It should be put on while the belt is runing slow, say at night or stopping-time, and run slow long enough to distribute it well. All animal oils are very injurious for rubber belts, causing them to 'peel up' and leave the fahric hare."

Tanning of Sealskins.—The *Shoe and Leather Reporter* furnishes the following interesting item in reference to the method of tanning sealskins and the use to which the leather is put: The tanning of sealskins taken from the hair seal, captured on the northeastern coast of North America, is carried on to a large extent in Great Britain and France. They are made into a pebbled or grained upper, similar in appearance to coarse morocco, or into varnished leather. The skin of the seal is light, but of a close texture, and when properly tanned yields a very tough leather. In Europe it is made up into ladies' shoes. The rough-haired or "bluebuck" sealskins are the kind used. The tauning and finishing process for these skins requires six weeks' time. The process is similar to that used for making morocco leather. They are soaked, the grease taken out, fleshed, limed, unhaired, then split, bated and tanned in equal quantities of sumac and oak bark. Some forty years ago a large business was done in this country in tanning sealskins, but although the raw material is obtained on our coast, the industry is not at present pursued here. The catch is mostly around the coast of Newfoundland, and this season it has been very large, amounting to 455,813 seals. They are caught for their skins and oil. The local value of the animal is about $2 to $2.50 each, and they weigh, on an average, 50 pounds. The skins sell in London for 50 to 75 cents apiece. The leather made from them averages about 75 to 100 feet to the dozen skins. Many years ago these skins were used in this country for coverings for hair trunks and splits for carriage-makers. An imitation called "seal grain" is now rather fasionable, and a business might be built up and become profitable in tanning the real article for shoe-manufacturers' uses, as is done in Europe.

Rail-Testing in Germany.—The German Railway Union has agreed upon certain specifications to be satisfied in the steel rails they use. The tests to be made in the works are these: A rail placed upon supports 3 feet 4 inches apart must bear a load of 20 tons for several hours without permanent flexure. In like position it must bear without breaking two strokes of the monkey of a pile-driver a weight of 1100 pounds falling 13 feet, and without any injury a falling of the monkey 5 feet. The rail must be capable of being bent in the cold state, either way to the extent of 2 inches without showing cracks or fissures. It must further be capable of bearing a curvature of 9-10 of 1 inch in 9 feet and 10 inches.

Silver in the Arts.—A circular has been prepared by the Mint Bureau for the purpose of ascertaining the amount of gold and silver used in manufactures and the arts in the United States during the last fiscal year. It will he forwarded by mail to manufacturers, with a request that they fill up a blank form which will he inclosed, calling for the amount of United States coins melted and worked up, fine bars used, and foreign coin, dust and old manufactured articles made into new work. Nearly 3000 answers were received from persons addressed with a similar object in view last year, which showed that there had been an aggregate of $12,198,363 in gold and silver used in the manner indicated during the fiscal year 1880.

Good Health.

Diphtheria.

Editors Press:—As the cold and stormy season of winter is now upon us, mothers commence housing the feehle, delicate little ones under their charge. But let me ask, would it not he far wiser to send them out for a while at least every day into the pure air? Investigate most thoroughly every part of your dwelling. See for yonrself that the cellar is well ventilated, that there are no decaying vegetahles ahout it, that it is perfectly dry and healthy. The walls should be whitewashed and disinfectants scattered over the floor. Chloride of lime is the cheapest and hest for this purpose. If water closets are in the house they ehould he carefully examined hy an honest and reliable plumber. Stationary washstands ought also to he looked to, and the traps put in perfect order. A small quantity of enlphate of iron dissolved in two gallons of hoiling water should he thrown into the closets and wash basins at least twice a week. Allow no withered flowere to etand, for the water hecomes dead, and the decaying etems produce a malaria in the air, which, to a delicate pereon, provee extremely hurtful.

With these precautions and the little ones put upon a hea'thful nutritione diet, many untimely deaths may he prevented. Many persons think that diphtheria ie comparatively a new disease. On the contrary, it is known to have been prevalent in Egypt over 2,000 yeare ago. It appeared in Rome A. D. 334, was highly contagious, and was called the Egyptian nlcere, appearing in all casee in the throat.

When the first symptoms of soreness in the throat are noticed, itis well to gargle the throat with water, not too cold, and with a little salt dissolved in it, making it slightly hrackieh, like sea water. See that the stomach and howels of the patient are in good order, and then send for the family physician as soon as poseihle. One reason why so many cases are fatal, is that there is oftentimes a delay of a few hours, and the disease obtsins a powerful hold upon the patient, when a slight remedy administered in season might have arrested its progress. Here comes in full force tho old adage, "An ounce of prevention is worth a pound of cure."

It is doubted by some whether diphtheria is contagious. I will cite an instance. A lady living in San Francisco lost a little girl with the disease. The year following she visited friends in Boston, and a few days after her arrival their little child died with the disease. A. C. A.

Berkeley, Cal.

Tomatoes as Food.

Tomatoes, remarks an authority, are not without some defects as an article of food. They are not, like milk, a perfect diet of themselves, and besides, like most other articles of food, they contain some obnoxious qualities. But they need not be throwu aside on that account. Nature has provided us with such sufficient excretory orgaus that obnoxious matter in our food, if in moderate amount, is readily cast out, and the body is protected against any material injury. Were it not so, we should he obliged to throw out of our dietary many kinds of food now eaten, not only with impunity, but with advantage. Thus, red cahhage, cherries and peaches contain prussic acid, which is a deadly poison when taken in sufficient quantity. The very small amount of the poisoning acid these vegetables contain is cast ont of the system without any material injury to the person using them. A positive good may actually he derived from the use of food containing some such foreign matter, hy way of giving increased activity and strength to the excretory organs from their exercise in casting such foreign matter from our bodies, provided the quantity is not so great as to overburden them. Since we are all the time liable to take in our food substances the tendency of which is harmful, a good development of efficiency in our excretory organs is necessary to protect us against the pernicious effects which might otherwise occur. Almost every kiad of grain and fruit in use contsin more or less things which in a larger amount would prove hurtful. Unless we closely study our food, we are taking them in when we little suspect it. A Frenchman, not many years ago, discovered a substance in wheat hran, under which the high heat used in baking, dissolved out and spread over the crumbs of bread, of which bran forms a part, and discolored it, and hence the brown stain peculiar to graham bread. But from this discovery such bread hae not been rejected, hut continues to he accounted among the most wholesome kinds of food. Rye is seldom used without containing more or lese ergot, hut rye bread ie aleo reckoned among the most healthful. Tea contains tannic acid, apples contain malic acid, lemons and oranges citric acid, no one of which is used either in nutrition or reepiration, hut they only become objectionable when used excessively. —*Leeds Mercury.*

Howard's Method of Artificial Respiration.

We think it advisable at this season, says the *Canadian Journal of Medical Science*, to direct attention to the following rules for resuscitating the partially drowned:

1. *Instantly* turn patient downward, with a large, firm roll of clothing under stomach and chest. Place one of his arme under his forehead, eo as to keep his mouth off the ground. Press with all your weight two or three times, for four or five seconds each time, upon patient'e hack, so that the water is pressed out of lungs and etomach, and drains freely out of mouth. Then,

2. *Quickly* turn patient, face upward, with roll of clothing under back, juet below ehoulder blades, and make the head hang back as low as possihle. Place patient'e hands ahove his head. Kneel with patient's hips hetween your knees, and fix your elhows firmly against your hips. Now, grasping lower part of patient's naked chest, squeeze his two sides together, *gradually* forward with all your weight, for about three seconds, until your mouth ie nearly over mouth of patient; then, with a push, *suddenly* jerk yourself hack. Rest about three seconds; then hegin again, repeating these hellows-hlowing movements with perfect regularity, so that foul air may he pressed out and pure air be drawn into lunge, ahout eight or ten times a minute, for at least an hour, or until the patient hreathes naturally.

Eating.—The mejority of mankind neither know how to eat nor what to eat. Persone should allow themselves sufficient time to masticate their food well, and not force tho stomach to perform the double work of chewing and digesting. As to quantity and quality, everyone ehould make hie own selection. More harm is ueually done by too much and too great a variety than by richness in quality. No general rule can he laid down; each etomach indicates ite own adaptations and preferences, and its own fullness; and if the eater will mark well the monitione of thie faithful thermometer, he will soon he able to regulate his diet better than any phyeician or strolling quack, who professedly announces either through puhlic or private lectures.

Passing Events.

The feature of the week in mining circles has been the sudden excitement in the stock market, based on a suppositions "strike" in Sierra Nevada. Our stock tables show what it amounted to in the way of varying prices. It brought to the front a lot of stock dealers who have been out of sight for a long time.

The Indian disturbances in Arizona are creating a good deal of discussion, and it is likely the occasion will be seized upon to urge some better system of managing the Indians than that now in vogue.

Already signs of winter are beginning to show themselves. Snow has appeared up in the Sawtooth range, Idaho and also in Utah. It will not be long before prospectors will have to hunt for their cabins and lay up for the winter. Then they will begin to think California, Arizona and New Mexico are good enough countries for a while.

President Garfield seems to be improving somewhat since his removal to Long Branch, but his recovery is by no means certain as yet.

Local mining news from various quarters seems to be encouraging. From many points we hear of strikes, and nearly everywhere the work of development is proceeding with energy.

CORRECTION.—In the last issue of the PRESS, in the article by Mr. Aaron, for "Wm. S. Key," read "Wm. Skey." For "iron, steel, sulphur," etc., read "iron, zinc, sulphur," etc.

Slimes and Tailings.

The term "slimes" applies to that portion of the crushed ore which is reduced by the stamps to an exceedingly fine condition, and, flowing from the batteries in the stream of running water, does not find sufficient opportunity to deposit itself in the tanks in which the coarser sands are collected, but is carried beyond them, and only settled, after a long time, either in another set of tanks or in large reservoirs. These are properly called "battery slimes," to distinguish them from the material that may be reduced to a similarly fine condition by the operation of the pan.

The term "tailings," in milling, is understood to apply to that portion of the crushed ore, which, after having been subject to the grinding and amalgamating process in the pan and settler, flows away from the latter, or from the agitator, and passes on out of the mill, deprived of the greater part of its valuable contents. A part of this material is in a very fine and slimy condition, but the bulk of it may be better described as a fine-grained sand.

Leaving the mill, the stream flows onward and is usually subjected at once to various methods of concentration, the most common of which is the blanket table, by which means a portion of the escaping amalgam, quicksilver and heavier particles of ore may be extracted to be reworked, while the great mass of material is finally collected in dams or reservoirs for still further treatment. Reservoirs for this purpose are placed at convenient points along the corner of the streams or canyons on which the mills are usually placed. In these reservoirs everything brought down by the streams finds a resting place, and is reserved for work in the tailings mill.

Mr. James D. Hague, in a chapter on this subject in Clarence King's "Mining Industry," describes the whole mode of working both the slimes and tailings, the method of concentration and treatment of raw tailings.

He shows the quantity of slimes produced in crushing ore varies considerably in different mills. Some mills on the Comstock, the preparation of slimes was thought to be almost 2% of the ore crushed by the stamps, while in others it was as high as 10%. This is partly due to the difference in the conditions under which the crushing takes place.

As these slimes carry with them much of the very finely crushed silver ore, their assay value is not only considerably higher than that of common tailings but often higher than that of the original ore. Especially that portion of the silver bearing mineral of the ore which exists in the form of rich sulphurets, being soft and readily crushed, is liable to be reduced to an impalpably fine condition, particularly if freed from particles of quartz that might, if present, preserve it in a coarser form, and escape with it from the battery before being reduced to slime.

The Indian Troubles in Arizona.

While it was found that the first news of the massacre of Carr's command was greatly exaggerated, it has served to call the attention of the whole country to the Indian question again. And this time, judging from the tone of the press, the policy of turning the Indians over to the War Department is still more strongly urged than ever before. The miserable policy of our Government toward the Indians has inspired them with a contempt for our people and our soldiers, and it is not only difficult to keep them on their reservations, but to keep them in any kind of order. The rascality of Government agents and Indian contractors has bred dissensions, and these men, of course, are desirous of keeping affairs just as they are.

The breaking out of the Indians in Arizona will do the Territory more or less harm of course, and more particularly its mining interests. But this will only be temporary, since now the country is settled up to some extent, a wild horde of savages will not be allowed to ride rough shod over the people. If the Government does not adopt reform measures the citizens will, and when that time comes the Apaches had better hunt their holes. Of course a good Indian fighter with suitable troops, and left free from entangling and embarrassing directions from Washington, could settle the question with the Indians in short order. The thing is, will such a man be sent there and allowed to carry on the campaign in his own way. We see that the citizens in one of the large cities have held a mass meeting and petitioned Government to remove the Apaches to the Indian Territory.

Gov. Fremont, of Arizona, has suggested to the Interior Department, apropos of Apache troubles, that the United States unite with Mexico to use a portion of the upper part of Lower California as a place of exile for all troublesome Indians. Mexico, he suggests, is equally interested with the United States in sequestering the Indians of the border, and would unite with us in executing the scheme. The Pacific ocean, the Gulf of California, and a chain of forts on the isthmus, would hem them in. Then peace would prevail throughout the West.

There is one thing about this plan. It means, practically, extermination without the trouble of exterminating. The Indians would starve for want of food and water, for it will be hard to find a more God-forsaken country than the peninsula of Lower California.

Mining Boats for River Work.

In last week's PRESS, we gave some observations on Georgia gold mines, and the proposed method of working the river beds by means of vacuum dredging boats. It seems almost too bad to throw any cold water on such plausible schemes, but we venture to say the vacuum mining boats will get more water than gold. If freight was not so high between here and Georgia, they might get mining boats cheaper than building them. There are a dozen or so here, which could be bought for a song, taken to pieces and shipped.

The Boston company which was to build dredging boats for working those Georgia rivers, is perfectly informed of the failure of the process here, as they wrote here for information. So it is probably a scheme to sell stock, more than anything else. The California rivers are probably as rich as those of Georgia, and as large nuggets lie hidden here as there; but of all the mining boats, vacuum dredges, etc., built here for working river beds, not a single one ever yet got enough gold to pay for itself. Many difficulties present themselves when practical work is begun. The vacuum dredges bring up dirt and rocks, but little gold, in places where gold is known to be comparatively plentiful. Why this is so seems strange, but it is none the less a fact. Several hundred people in this city who have put money into these mining boat experiments, can testify to the utter worthlessness of such appliances. Miners all along the river can also give their experience. Still every few years some new crowd comes along and starts in, entirely ignoring the experience of others before them. When they are told of it they say they have a new and better system, and know how to do it better, or have better ground.

But they have all failed, not only on the rivers, but wherever they have tried to pump up golden sands. On the sea beaches of our northern coast-line, where the sands are auriferous, samples of sand outside the surf line showed fine gold in quantities to pay, but schooners fitted up with powerful steam pumps, vacuum arrangements, etc., all proved failures. In fact, we do not remember a single instance of success in this kind of mining.

It is to be noticed, in the reference to the Georgia gold fields, before spoken of that they know there is gold on the river bottoms, but that the vacuum boats are *being built*. No work has been done with them there yet. There is a strong probability that their experience in Georgia will tally with ours here, when they get at work. No process of mining looks better theoretically than river-bed mining with vacuum dredgers. There is plenty of water, lots of river bottom, steam power will do the work of men, and all you have to do is to get the mud up and pass it through sluices, etc., catching the gold. But you don't catch the gold. Theoretically you do, but practically you don't. When the Georgia people get through experimenting with their river boats, and make a success of any one of them, they can come out here to California and make money out of the secret. There are a number of rivers here which have gold in their beds for hundreds of miles. But the presence of the golden sands in these rivers by no means assures profitable work to those who attempt to get the precious metal.

MINT SUPERINTENDENT DODGE EXONERATED. The Commission, consisting of Alexander Ramsey, Thomas L. Young and S. O. Houghton, appointed to investigate the charges made by H. F. Page against H. L. Dodge, Superintendent of the United States Mint at San Francisco, has concluded its investigation, and submitted its report to the Secretary of the Treasury. The report fully exonerates Dodge from all charges preferred against him, concluding as follows: The Commission would respectfully report that the evidence did not establish any of the material charges made, but did establish the fact that, in place of being "extravagant," the Superintendent has been economical, and has operated the Mint within the appropriation to the extent of $95,000 of the money appropriated by Congress for the support of this Mint, besides having reduced the estimates for the appropriations from year to year since the beginning of his administration; that instead of being "law-defying," he has followed the law and instructions in every particular charged, and that instead of being corrupt he has been honest, and his administration has been free from the slightest touch of corruption. The members of the Commission are satisfied and feel that they would not be discharging their full duty if they did not state to you that the charges were without any foundation, in fact, were, in their opinion, in all probability the result of misinformation communicated to Mr. Page by friends who sympathized with him in his political quarrel with Mr. Dodge, and that but for such misinformation and the fact that Mr. Page considered himself aggrieved by the discharge of his friends and appointees from the Mint, the charges would probably not have been made.

INCREASE IN THE STOVE INDUSTRY.—During the last five years the increase in the value of stoves manufactured in the United States has been 35%. The total value for 1881 is estimated at $65,000,000.

Extraction of Gold from Sulphurets—No. 2.

(Written for the MINING AND SCIENTIFIC PRESS by C. H. AARON.)

Prominent and promising among new schemes is the project of applying the chlorine under heavy pressure, while agitating the ore in presence of water. This is known, or is becoming known, as the Mears process. To those who are acquainted with the nature of chlorine, it will not seem surprising that considerable difficulty was encountered in the application of this method. It is asserted that these difficulties have now been overcome, and that the results are eminently satisfactory. The process has been carried on for some time in the Eastern States, and works have recently been established in California. The sulphurets treated here are said to be unusually refractory, to contain about 4 ozs. of gold to the ton, and the tailings, it is affirmed, retain only one dollar to the ton. At the same time, it is claimed that the plant is cheaper, and the operation cheaper and quicker than by the ordinary Plattner process. If these statements are true, it ought to be but a short time until the Mears process supersedes the older method entirely. But, *"festina lente."* Let us await the verification of time. We have been disappointed too often to be over sanguine.

Interested though we all are in the subject of a better method, in regard to new metallurgical processes, the attitude of doubt is the attitude of common sense, taught by experience. That the prime cost for the installment is less on this new system than on the old, is difficult to believe; that the saving in the item of chlorine alone is 90 cts. per ton of ore, at San Francisco rates, as has been stated, is impossible.

That the action of chlorine is accellerated by heavy pressure has long been known (and there may be a doubt as to the validity of a patent claim on this point, *perse*), hence we were prepared to bear that, by this method, coarse gold, as well as fine, could be dissolved in a reasonable time, and that an exposure of from 15 minutes to two hours is sufficient for the chlorination. But charged vats eat nothing, and, in the humble opinion of the writer, the advantage of the Mears process depends, not on the celerity of its operation, but on the perfection of its results, and the durability of the apparatus. When the machinery for the works at the Bunker Hill was being made, a person who was in a position to know, assured the writer that it was very expensive, and if it is going to be quickly destroyed, that circumstance will militate greatly against the process.

No sooner does an inventor lay before us a scheme of any importance than others come to the front, in the endeavor to equal or surpass him. Accordingly the Mears process is followed by another modification of that of Plattner, which comes to us all the way from Maine. It consists "in exhausting the air from the vessel containing the ore, prior to admitting the chlorine;" in storing the gas in a gasometer, etc. The ore under treatment is "tumbled over itself" in a rotating cylinder, and "when chlorination is complete the ore is to be taken out, either wet or dry, and leached."

This reads very much as though the inventor had evolved his invention in the same manner as the Dutchman evolved the picture of a camel, namely, out of the depths of his own interior consciousness, without any practical knowledge of the matter. The invention seems to be of that large class which are suggested by simply *reading* of some other, and are the offspring of a greedy desire to undermine or circumvent the results of labor and ingenuity, without the expenditure of either. The Mears process also exhausts the air, and uses a gasometer, and on the whole offers a more reasonable prospect of improved results. An older plan than the two last mentioned is, to leach ores which contain gold alloyed to a considerable extent with silver, or too coarse for the ordinary method, with brine of common salt saturated with chlorine. This method was successful, though slow. It works much faster when pressure is applied.

We now come to a process which has been proposed and experimentally demonstrated on a small scale by Mr. Dixon, in Australia. This gentlemen experimented on a laboratory scale on arsenical and other pyrites by the ordinary method, and by means of bleaching powder and sulphuric acid, without success. He then devised and tested the plan of which the following is an outline:

The ore was roasted in a muffle, the fumes being conveyed into a tower in which they were condensed by water flowing over leaden shelves. The liquid thus obtained was a mixture of sulphuric and sulphurous acid with water. The thoroughly desulphurized ore was mixed with charcoal powder and exposed to heat, the oxide of iron being thus reduced to metal in powder, or iron sponge. This substance was dissolved in the acid liquid from the tower with great ease, and the gold remained in a favorable condition for amalgamation with quicksilver, ecorification with lead, or chlorination, in the insoluble residue of quartz, sulphate of lead, etc. Mr. Dixon also recovers copper, when present, by an ingenious manner of treating the solution which it is not necessary to describe here. Those wishing to know more about this interesting process, and the means proposed for its practice on the large scale, are referred to the *Chemical News*, Vol. XXXVII., page 281, *et seq.*

A good deal of remark and surprise has been excited by certain statements made by the writer, touching the volatilization of gold during the roasting of auriferous pyrites with salt. It appears, however, that the volatility of gold under the influence of chlorine is not so new as some of us supposed. It is stated that attention was first called to this fact by Boyle. In the *Chemical News* of March 19, 1869, a method of assaying gold quartz, by Bertelot, is given, in which the gold is volatilized in a current of chlorine, at a cherry red heat, and is condensed in metallic state in a cooler part of the apparatus, where the chloride decomposes in cooling. Again, in the issue of November 19th, same year, it is stated that chlorids of gold (terchloride ?) is decomposed at 200° (centigrade presumably) into chlorine and a lower chloride, and at a higher heat, into chlorine and gold. It is, however, also stated that chloride of gold can be volatilized in a current of chlorine at 300°.

If the writer is not in error, Plattner states that, in the chloridizing roasting of ore containing gold, that metal is converted into terchloride, which is afterward decomposed, at a higher heat, forming, first, protochloride, and then metal, with evolution of chlorine. It is not irrational to suppose that, in a very slow roasting, such as is given to auriferous pyrites, a considerable portion of the terchloride may be evaporated before the heat is sufficiently high for its decomposition, especially in a three-hearth furnace, in presence of the chlorine evolved from the finishing hearth, although this latter condition does not seem to be necessary, as more than 50% was, in one experiment, evaporated in the muffle, where no such condition existed. The only matter of surprise would seem to be, that but little of the gold remained in the flues and dust chambers, which were quite extensive, possibly the presence of base chlorides, or the sooty lining of the chambers, had some effect in preventing the deposition of the gold. It frequently happens that a large percentage of salt is used in the roasting of pyrites on account of the presence of talc in the ore, yet no great loss of gold is experienced, although the salt may be charged with the ore. The explanation may lie in the fact of the presence of talc, which, by absorbing the greater part of the evolved chlorine, prevents the latter from combining with the gold. Certainly, in the roasting of such ore, the smell of chlorine is at no time very strong, nor is it perceptible until the roasting is so far advanced that the heat is far above 200° centigrade.

Note.—From Mr. Atwood's article on "The Milling of Gold Quartz," it appears that the learned gentleman still adheres to the belief that nearly all the gold in pyrites is chemically free, and may be collected by amalgamation if the material is ground sufficiently fine. Mr. Kustel in his work on roasting ores, etc., expresses a different opinion. Some time since the writer made an experiment, with the view of vindicating his own and Mr. Kustel's view. Some sulphurets from Nevada county were digested in a solution of sodium polysulphide, with the addition of free sulphur, by which gold sulphide, if present, ought to have been dissolved, but on testing the liquid for that metal, not a trace of it was found. Mr. Dixon, of Australia, whose proposed process has been outlined above, made exactly the same experiment, with the same result. This may be conclusive as to the presence of simple gold sulphide, but does not prove that the gold is metallic, and the absolute invisibility of the greater portion of the metal in finely ground sulphurets, with the aid of a good lens, even in cases in which it is plainly visible to the naked eye, after oxidation of the material, points to the suspicion that it *may* exist as a compound of iron, gold and sulphur. Such a compound can be made in the dry way, but it must be admitted that pyrites are more probably of aqueous, than of igneous origin, and it is abundantly certain that metal sulphides can precipitate metallic gold from a solution of terchloride, though such precipitation is accompanied by oxidation of the sulphide, at least in the laboratory experiment.

It is not, however, proposed to argue the question on theoretical grounds; and as to the practical question of the possibility of working sulphurets by amalgamation, as advocated by Mr. Attwood, that, at least, is surely susceptible of a practical answer. There are, at the present time, many mine owners who are considering the project of establishing chlorination works at their mines, and who would doubtless be much obliged to anyone who would demonstrate that amalgamation; without roasting, would be better; but they will not be convinced by statements of what is done in so remote a country as Brazil. As Mr. Attwood seems to feel considerable interest in the subject, it may not be impertinent to suggest that it would not cost him much to make a few tests on samples of alleged refractory sulphurets, and he would then be able to give us facts which we could verify for ourselves, instead of theories and assertions, of the accuracy of which we have no means of judging. For the purpose of such tests, it is suggested that the sulphurets of the Murchie mine, in Nevada county, and of the Bunker Hill, would be suitable, as being rather difficult to work by the chlorination process.

It is true that we might make these tests for ourselves, but our failure would probably not convince Mr. Attwood, nor, in the face of his persuasions, would it be entirely satisfactory to ourselves, while his failure or success would go far toward settling the question in all of our minds. Mr. Dixon's tests on Australian sulphurets were signal failures, both by amalgamation and chlorination—the ore being roasted in both cases—but that circumstance does not by any means prove that either process is inapplicable, as the failure may have resulted from incorrect manipulation. One success is worth more, as an argument, than a dozen failures; yet on the other hand, a large number of failures has a certain force, especially as against mere theories.

Touching the concentration of sulphurets, in a small way, as a check on the larger operation, it is suggested that while the latest is an excellent instrument in skillful hands, a great deal of time and labor may be saved by the use of Sounstadt's solution, by means of which all matters of a less specific gravity than 3.01 may be separated by flotation from denser substances. This solution is made by adding to water the iodides of potassium and mercury alternately, in a dry state, until neither is dissolved. The density can be adjusted to any point below the above figure, and the solution is said to be very useful in the separation of different minerals, as diamonds from other stones, for the purpose of microscopic or other investigation. As it is more than probable that Mr. Attwood is familiar with this subject, the writer does not presume to address the suggestion to that gentleman, but others may find it useful.

Moro Rock.

One of the prominent landmarks on the southern coast of California is El Moro, a high coni cal rock not many miles above San Luis Obispo. This curious rock, shown in the engraving, is on Estero bay, which was discovered by Cabrillo as long ago as 1546, and here he obtained wood and water. Behind El Moro are several lagoons or streams, and the high land retreats for some distance, leaving the shore low and sandy. From Moro up the coast or as far as Piedras Blancos the hills set well back from the shore, leaving a tract which is now covered with thrifty farms, dairy ranches, etc., the towns of Cayucos, Cambria and San Simeon being the center of the settlements.

MORO ROCK, ON THE CALIFORNIA COAST.

The big Moro rock marks the entrance to Moro bay, which is a sort of lagoon or arm of the sea, immediately behind the protecting rock. Once behind the rock a small vessel is safe from all winds, but the entrance is so difficult that the insurance companies will not underwrite on vessels trading there. The place is really unsafe for sailing vessels, but small light draught schooners trade there. There are several small wharves in the lagoon, and produce is brought from the head of the bay in small sloops down to the steamer or schooner. Lumber is carried to this bay, and dairy produce, wool, hogs, etc., are shipped. Shipments from the wharf in this little bay last year were 12,337 sacks of flax seed; 10,944 sacks of wheat; 4,726 sacks of beans; 1,160 hogs. The imports were mainly lumber. It is a good farming country in the vicinity, the land being a sandy loam. Further south along the coast lies the Canada de las Osas rancho, of 32,430 acres, adjoining on the south of which is the Migalito rancho of 22,135 acres, nearly half of which is waste mountain land. It is only a few years ago that this whole region was a pastoral one; but now farms, dairies and little settlements dot the landscape.

AMERICAN INDUSTRY ABROAD.—The British army in South Africa, in the course of the war with the Basutos, found and destroyed some American plows. The fact is significant as showing how far-reaching is the American name and influence. The American threshers breaks the quiet and sleepy valleys of Palestine. The American mower and reaper perform the labor-saving operations among the vines and fig trees of Asia Minor. American agricultural implements carried off the prize last summer at a fair in Bulgaria, not far from where American Martini-Henry rifles, in the hands of the Turks, ranging a mile further than the old-fashioned weapons of the Russians, made deadly havoc on the fields of Plevna. American locomotives thunder over the plains of Southern Russia, and through the gorges of the Caucasus to Tiflis almost on the confines of Persia.

RANSOM COOK, who recently died in Saratoga county, N. Y., at the age of 80, was said to have been a proficient in 26 trades and the owner of 27 patents.

Status of Mining Industry in California.

[Written for the PRESS by JOHN HAYS HAMMOND.]

In answer to your letter I will say that other engagements and absence from the city have prevented my earlier compliance with your request.

During the year 1880 as special expert of the U. S. Geological Survey and Mineral Census, I made a thorough examination of the geological and mineralogical features of the ore deposits of California, the mining and metallurgy of the same, and all questions pertaining to the economy of vein and placer mining in this State.

In making this investigation, I visited nearly every mine from Kern to Sierra county, including the mines of the Bodie and other districts in the mineral belt along the eastern flank of the Sierra Nevada mountains.

My examinations were made under exceptionally favorable auspices, in having, as I did, access to the books containing the accounts of the different mining companies, being enabled thereby to obtain complete and reliable data upon which to base an opinion of the present status and the future prospects of our mining industry.

The causes to which are referable the many failures that have attended mining investments, the remedies to be adopted to prevent a recurrence of these disasters, and the means to be employed to obtain for California the just recognition of its transcendant merits as a field for mining enterprises, have been subjects of my constant consideration, and for the realization of the desiderata you may rely upon my earnest co-operation.

I believe that no other State or Territory in the Union can show

As Large a Bullion Production

In proportion to the capital invested in developing the mineral resources.

No other section of the Union offers, in my opinion, as great inducements as this State, for the prosecution of legitimate mining, in that it costs less to obtain possession of a property here than elsewhere, a smaller expenditure is required to prospect it, and, in the event of the preliminary exploration proving the property worthy of exploitation, it also costs less to mine and to reduce the ore.

The salubrity of the climate of this State, the accessibility of its mines, comparatively speaking, admits of the prosecution of mining work, unaffected by climatic inclemencies, the acquirement of skilled labor at reasonable wages, and the cheap transportation of mining supplies—conditions of much economical importance in the discussion of the relative advantages of mining districts.

The almost universal abundance of wood and water in this State is, too, a feature of incomparable advantage.

The indispensable condition of profitable mining is, of course, the presence of pay ore in sufficient quantities, and this condition is fulfilled, as the data collected during my investigations indisputably attest.

The Geology of Our Gold-bearing Formations

Is now well known, and no mining geologist of note will, in view of the proofs to the contrary, entertain any doubts as to what is known in mining technology as the permanency of our veins.

The theory that our veins are limited in depth has long since been admitted untenable, and it is surprising how a notion so much at variance with the facts of the case, could have obtained so generally.

That the pay-ore is not co-extensive with the ore-bearing formation is well known, and the term permanency, should, for the sake of greater perspicuity, refer to the continuity and persistency of the vein in its course and in its dip—irrespective of its gold tenor.

The size, in its three dimensions—width, depth and length—of the pay-shoot is one of the determining conditions in the appraisement of mining properties, and the laws pertaining to the zonal distribution of the pay-ore in our auriferous quartz veins, are (or ought to be!) so well understood by the mining men of today that the cost of prospecting or exploratory work should be reduced to a minimum.

I shall be pleased, at some future opportunity, to contribute an article upon this subject, in connection with the discussion of the geological and mineralogical features of the great Veta Madre or mother lode of California.

My theory as to the genesis and character of this great formation is essentially at variance with that generally entertained, and with due deference to other geologists who have written on the subject, I feel confident of being able to substantiate my iconoclastic theories.

Want of business foresight, precipitancy in the erection of costly mining and milling plants, the failure to open up pay-ore reserved for future requirements—in short, a most persistent disregard for the very fundamental principles requisite for success in commercial pursuits, have often entailed financial catastrophes upon mining enterprises that possessed intrinsic values.

There is, in my judgment,

A Bright Future

For the mining interests of this coast. The revival of active interest will be slow, but none the less sure.

Capitalists will gradually come to the conviction that where chances of failure are less, where the costs of their "specs" are also less, and the rewards of their successes are as great as elsewhere, is the best field for their mining investments.

In these respects, California, I am of the opinion, "fills the bill" better than any other mining country.

The old saying, that "distance lends enchantment to the view," finds its verification in the great attraction that the terra incognita of Arizona and the Mexicos seem to have for capitalists; but, as I have said, there is a growing change of opinion in this regard, and a steady progress is being made in the development of our inexhaustible resources.

Mining has received a temporary set back in the unfortunate controversy that has arisen between the agriculturists and the miners.

As regards the ultimate solution of this all-important problem, I have no serious apprehensions, and I believe, with others who have studied the question, that the issues threatening the two interests—as indissolubly connected and as interdependent as were the Siamese twins—will be adjusted without prejudice to the well-being of either.

To the engineering skill of the State Engineer's department we must look for the only equitable settlement of this question, and if "judgment has *not* fled to brutish beasts, have *not* lost their reason," the twin interests of agriculture and mining will co-operate and reconcile their differences upon a basis the most mutually advantageous.

Tunnel Work.

There is no part of the world where so much tunnel work is carried on as in California. There is, of course, more or less tunnel work in quartz mining, but in drift mining operations, very long tunnels are necessary in many cases, for "bottoming" the gravel channels. Long tunnels have often to be run in hydraulic mining work, also. As an instance of quick work in this line, may be cited the tunnel being run by the Ruby Gravel Co., in Cariboo ravine, one mile south of Rock creek, Sierra county. It is thus briefly described by the local paper, the *Mountain Messenger:*

Work was commenced last December, and since that time 2,050 ft. of tunnel have been made. In round numbers the tunnel, all but a few hundred feet of the outer end is 10 ft. square, nearly all through hard rock that required blasting, and that stands without timbers. For 1,950 ft., the tunnel follows an air line, the course being a little north of east. The last 100 ft. is turned to the south 17° from the former course. The grade of the tunnel is ½ inch to 12 ft. At the mouth of the tunnel the company have a substantial engine house, and a powerful engine which drives the air compressor and a Struve two-plunger ventilating pump. From the compressor the air passes to a large, upright reservoir of heavy boiler iron, about 10 ft. in hight and 4 ft. in dimeter. From this reservoir the air is taken, under a pressure of 50 lbs. to the square inch, in 4-inch wrought iron pipe, to the drills, running along the bottom of the tunnel.

The air from the ventilating pumps is taken in a 12-inch air pipe and boxes to near the face. The last 150 ft. of tunnel is in softer rock, a species of quartzite, so hard as to require blasting, but not hard enough to stand long without timbering and spiling. About 150 feet from the face a shaft has been started, and is now up about 40 ft. in blasting rock. It is designed to test the question as to whether or not there is gravel overhead. Mr. H. Jennings is now Superintendent of the works, Mr. H. Wallis acting in the capacity of consulting engineer. Mr. Edge is the engineer in charge of the machinery. For rapidity of construction and size of tunnel, there is probably nothing in California that exceeds this work. From its inception until within a few weeks H. Wallis has been Superintendent in charge, Hamilton Smith, Jr., being Superintendent in Chief.

THE IRON BUSINESS.—The iron business was never better than now in the United States. Every respectable machine shop in New England and the Middle States is full of work, and many of them running night and day. The consumption of iron is enormous, and is rapidly increasing in every direction. Prices are simply firm and strong, not excessive.

WAGONS

At the SANBORN WAGON DEPOT,

24 and 26 Beale Street, S. F. Cal.

Three sizes of THOROUGH-BRACE WAGONS, with 1, 2 or 3 seats. Eight sizes of EXPRESS AND DELIVERY WAGONS. Three sizes of FOUR SPRING WAGONS, with 1, 2 or 3 seats. Besides Business Wagons and Buggies.

Also, all sizes of FARM WAGONS, made by Mitchell, Lewis & Co., of Racine, Wis., who make the best Farm Wagons in the world. All our Wagons are fully warranted. **A. W. SANBORN & CO.,**

SECURE PATENTS

Through Dewey & Co.'s **Scientific Press** Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS,

A. T. DEWEY. W. B. EWER. GEO. H. STRONG

THE O'HARRA
CHLORIDIZING FURNACE.

Patented in 1878.

SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1.10 per ton to work 40 tons in 24 hours.

At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61½.

Lewis Chalmers, of the Isabella G. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenual sulphurate of silver up to from 84% to 95% of the assay.

SEND FOR DESCRIPTIVE CIRCULAR TO

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,
SAN FRANCISCO, CAL.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

SHEET IRON PIPE.

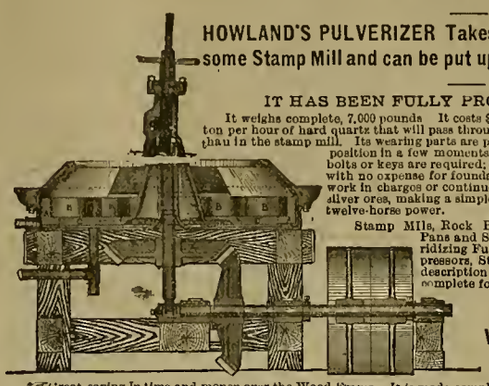
MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery



HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds It costs $1,500 ready for the belt Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.

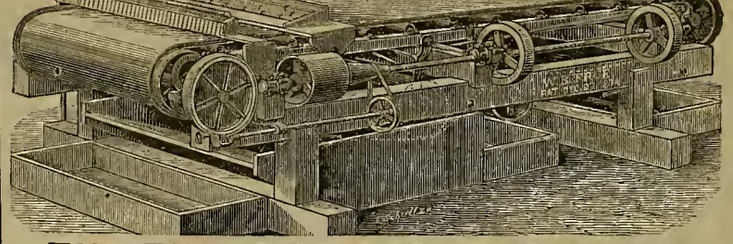
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

$1,000 CHALLENGE!

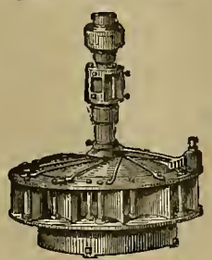


THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of **$1,000** each, and we mean business.
☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

LEFFEL'S IMPROVED WATER WHEEL.



PRICES REDUCED!
PATENTS REISSUED 1868.
The "OLD RELIABLE" with improvements, making it
THE MOST PERFECT TURBINE NOW IN USE.

Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.
Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

Excelsior Blasting Powder,
—MANUFACTURED BY—
THE EXCELSIOR POWDER COMPANY.

This is no NEW PATENT NON-EXPLOSIVE SAFETY POWDER, but the GENUINE STANDARD ARTICLE, and as safe to use and handle as any Nitro-Glycerine Powder manufactured. The Fumes and Gases, common in other Nitro-Glycerine Powders, are almost destroyed, and do not leave the miner with headache or nausea. Among the numerous recent testimonials the following is but a fair sample, constantly received, attesting the superiority of EXCELSIOR POWDER:

AUBURN, Cal., May 26, 1881.—EXCELSIOR POWDER CO.: I send you, per Wells, Fargo & Co., a box containing samples of country rock through which I am running our tunnel on the Conrad Mine, and through which we have now run 425 feet, 225 feet of it having been done with EXCELSIOR POWDER. If any one can produce harder rock I would like to see it. I here say that I can do more execution with your No. 2 Powder in this rock than I can with any No. 1 Powder of any manufacture I have ever used, and I have used every kind now manufactured here, excepting "Tonite," and I have had 20 years' experience in blasting. Respectfully yours, E. W. ROBERTS, Superintendent.

Give this Powder a trial and you will use no other. For Strength and freedom from noxious fumes, it has no equal. Address all orders to EXCELSIOR POWDER CO., No. 330 Pine Street, Rooms 53 and 54, Academy Building, San Francisco, Cal.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientifi Press," U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING AUGUST 30, 1881.

246,362—DREDGER—H. B. Angell, S. F.

246,397—INSECT PROOF SAFE—C. H. Larrabee, Napa California.

246 392—ORE FEEDER—F. A. Huntington, S. F.

246,500—BROOMS—Geo. Hall, Santa Rosa, Cal.

246 555—CART—D. W. C. Putnam, Petaluma, Cal.

246,383—CAR COUPLING—S. J. Ford, Placerville, Cal.

246,420—TRACTION APPARATUS FOR CABLE R. R.—H. Root, San Francisco.

246,361—CABLE CURVE—A. L. Anderson, S. F.

246,372—HYDRAULIC GRAVEL ELEVATOR—G.] W. Crans ton and B. Willson, S. F.

246,386—HORSE COLLAR—Grabel & Stanfenbeil, Ventura county, Cal.

246,387—THERAPEUTICAL GALVANIC BELT—Ira Gray S. F.

246,523—WIRE ROPE RAILWAY—Joel B. Low, S. F.

246,424—SOLAR REFLECTOR FOR SURVEYING INSTRUMENTS—Wm. Schmolz, S. F.

246,606—AX—P. R. Smith, Portland, Oregon.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

CAR COUPLING.—S. J. Ford, Placerville, assignor to George E. Williams, same place. Dated August 30, 1881. No. 246,383. This invention relates to certain improvements in drawheads and couplers for railroad cars, by which the inventor is enabled to unite cars of different hights by the use of the ordinary link.

ORE FEEDER FOR CRUSHING MILLS.—Frank A. Huntington, S. F. Dated, Aug, 30, 1881. No. 246,392. This improvement in ore feeders consists in a novel combination of a double feed hopper having two oppositely projecting feeding spouts or troughs with crushing apparatus upon opposite sides of the feeder, each being provided with a means for actuating the spouts and causing them to discharge ore with the crushers as required.

SPRING ATTACHMENT FOR SAWS.—E. Milburg, Callahan's ranch, Siskiyou county. Dated August 23, 1881. No. 246,033. This invention attaches a stout spring to the end of a cross-cut saw, such as is used for sawing trees. On one side of the tree-trunk some staples are driven, and into these are inserted the end of the spring. The other end of the spring is connected by chain-hinge or link. The saw is partially made to recover itself by the power of the spring, which renders assistance in pulling it back. It holds the saw well against the wood, and thus relieves the sawyer from much of his exertion to press the implement to its work. Its advantage is best seen in cutting upright timber. In such sawing it is inconvenient to press the saw in sidewise; but with this spring attachment this is accomplished. One man can thus use a long and heavy saw, which would otherwise require a man at each end.

A USEFUL PAPER.—One of the best and most useful papers published in California is the MINING AND SCIENTIFIC PRESS, published by Dewey & Co., in San Francisco. The edition of September 3d contains 24 pages of matter of more than ordinary interest, and every page has more or less of interest to the progressive industrial reader. In this issue a great deal of space is given to a very complete description of the cable railroad system which had its birth in San Francisco and which has fully developed there. It also gives an idea by illustrations of the various attempts made at the street railway system before it was perfected. In every number of the MINING AND SCIENTIFIC PRESS is to be found a synopsis of mining news from over the State, besides a great amount of useful reading matter not usually found in other journals. It only costs four dollars a year, and is worth ten times that amount to anyone interested in the progressive arts and sciences so rapidly advancing at this great age of inventions and improvements.—*Mariposa Gazette.*

AMERICAN LEATHER.—It is a seemingly strange fact that the hides of American cattle shipped to England on the hoof are reimported, tanned into sole leather here, and again exported. The cheapness of hemlock bark in this country is gradually giving our tanners a monopoly of the business of tanning sole leather, though the finest uppers are made in Europe.

THE PAPER INDUSTRY.—The present total capacity of all the paper mills of this country is set down at 2,500 tons per day of all kinds of that material. The out-put for 1880 is estimated at 25 per cent. over that of 1879. So large is the surplus that a combination of 307 manufacturers in July last offered a very large amount of paper for export without limit as regards price.

MINING MACHINERY FOR MEXICO.—Large amounts of mining machinery are being sent forward from New York to Mexico, to develop new and work old mines. The introduction of railroads into that country will greatly encourage and develop its mining industry. California should look more carefully after her interests in that direction.

The Panama Canal.

(CONTINUED FROM PAGE 185.)

The daily averages are between 29° 4′ and 26° 2′ C.

These meteorological observations have been regularly made at Colon at the mouth of the Rio Janeiro (Pacific) and at Gamboa (the central point on the Chagres. Borings have been made along the line of the canal across the Calebra to determine the character of the ground. Six shafts have been sunk between kilometric points 51 and 56. The deepest, which is 50 meters deep at station 51, struck hard rock at 43 meters. The next one, at station 52, at 23 meters, struck a bench of very hard rock, of 2 meters and more in thickness. Then it ran into a conglomerate; and then a second bench of very hard rock was struck. Finally they passed through a very thick bench of very hard rock, which they struck at 31 meters.

The other shafts have only indicated an argillaceous conglomerate. Finally, to determine the character of the ground at Empserador, a large shaft having a sectional area of 10 meters, has been sunk. At a depth of eight meters, they came across angular pieces of dolorite imbedded in a mass of colored sand.

The shafts are timbered, and have two compartments. Six houses have been built at Emperador for the corps of miners. A large carpenter shop, blacksmith shop, etc., have been put up for convenience in the shaft work. The frame-work and machinery for the sinking to 100 meters have been received and housed in. At some of the shafts palm roofs only have been put up to protect the men from the rain and the rays of the sun.

The Richmond-Albion Findings.

It will be remembered that the Richmond-Albion mining suit, was tried in the District Court, at Eureka, and decided in July last. The attorneys have been worrying over the "findings," but have finally settled the matter and the "findings" have been filed with the clerk. There are 31 special findings of fact. Notwithstanding the positive injunction of the court that the instrument should be withheld from the newspapers, the *Sentinel* has managed to procure a synopsis of it, and proceeds to submit it to the public as follows:

The court finds that the Uncle Sam mining claim, belonging to the Albion, was located prior to both the St. George and Victoria claims, belonging to the Richmond company; that the necessary work had been performed on the Uncle Sam each year; that an application for a patent was made by the Richmond company for the St. George claim; that a protest was filed in time and suit begun by owners of the Uncle Sam; that the $5 docket fee was paid by the owners of the Uncle Sam within the meaning of the statute; that such suit was prosecuted with all due diligence under the circumstances; that pending this suit the Richmond company obtained a patent for the St. George ground; this patent is the clared absolutely void for the reason that it was obtained pending proceedings and suit in de- District Court; that the Victoria patent for this same ground was obtained by the Richmond company after the issuance of the St. George patent; that no protest was made by anyone against the issuance of the Victoria patent, and that it is therefore good and valid; that the mining premises embraced in the Victoria patent covers most of the ground included in the St. George patent; that the Tip Top westerly end line extended should be at the point contended for by the Richmond; that the Tip Top is the prior patent in that locality; that there is one great lode or mineralized zone on Ruby Hill, extending in width from quartzite to shale; that all of the locations offered in evidence in this suit are situated on this great lode; that the first patent is entitled to everything between these walls; that the Richmond company has a valid title to all the mining ground embraced in the Victoria patent; that the Uncle Sam is entitled to the rest; that judgment is given in favor of the Albion for this last mentioned portion of the Uncle Sam ground, together with costs of suit; and finally, that all facts not specifically passed upon are found for the Richmond.

The above constitutes the whole pith and essence of the findings. A few minor points were omitted as unimportant matter. The case now goes to the Supreme Court on this statement.

Meetings and Elections.

DUDLEY M. CO.—Sept. 15. Directors, A. J. Ralston, N. K. Masten, J. M. Quay, W. M. Stewart, R. N. Graves. President, A. J. Ralston; Vice-President, N. K. Masten; Secretary, C. Van Dyck Hubbard; Treasurer, Bank of California; Superintendent, W. P. Holmes.

NORTHERN BELLE M. CO.—Sept. 13. Directors, G. T. Lawton, H. H. Allen, W. E. Norwood, B. P. Murphy, S. Reinhart. President, G. T. Lawton; Vice-President, H. H. Allen; Secretary, Wm. Willis; Treasurer, Bank of California; Superintendent, R. J. Jones.

MAYSELLE CON. M. CO.—Sept 13. Trustees, Wm. M. Stuart, (President), Wm. F. Herrin (Vice-President), Wm. B. Carr, R. N. Graves, and A. J. Ralston. Wm. J. Taylor, Secretary, and B. R Taylor, Superintendent.

New Incorporation.

FIDELITY M. CO.—Sept. 13. Location, Calaveras county. Capital, $10,000,000. Directors, J. B. Curtis, E. P. Gray, Giles H. Gray, F. J. Allison and Frank Cummings.

News in Brief.

GRAPE distilling will begin October 1st in Los Angeles.

CARP ponds are being built in many portions of Placer county.

GENERAL BURNSIDE died suddenly at Providence on Tuesday.

THE stage between Bisbee and Charleston, A. T., was robbed of $2,500.

THERE is talk of founding a historical and antiquarian society in Los Angeles.

THE California pioneers in New York had a grand time at Coney Island on Admission Day.

THE White Mountain Apaches, who are on the war-path in Arizona, number 750 all told.

NEAR Corfu, N. Y., forest fires have attacked the clearings, compelling families to abandon their homes.

he liberally endowed.

TWO hundred people were killed and 30 houses destroyed by a landslide at Elme, Switzerland, Sunday night.

THE California Southern railroad is now regularly carrying freight by rail between National city and San Diego.

J. R. KEENE says that he did not lose $1,500,000 in Hannibal and St. Jos Railroad stock, as was reported lately.

SEVERAL persons have been taken into custody on suspicion of being connected with the Cape Horn Mills train-wrecking.

FEARS are expressed in diplomatic circles at Constantinople, that the situation in Egypt may lead to differences between France and England.

A WELL at Benicia bored for artesian water has struck gas, and it is proposed to light the arsenal and barracks. The well cost the government $51,000.

THE pressing need of this season in Mendocino has been more laborers in harvest and hop fields, on sheep and dairy ranches, in the coast timber belt and at the mills.

ONE of the guards at the Washington jail "took a shot" at the assassin Guiteau, and came near depriving that scoundrel of the privilege of a trial for his crime.

HANLAN offers to row Wallace Ross, or any man in the world, a three or four-mile race, for from $2,000 to $5,000 a side, on a course to be mutually agreed upon. This will be his last race.

THE rebellious Egyptian officers refuse to accept the conditions offered unless their previous demands are first conceded, and boast they have the support of 80,000 Bedouins.

THE conference to consider State division met Thursday in Los Angeles. Delegates were present from San Bernardino, Ventura and Santa Barbara. Little business was done. Another meeting will be held in February.

THE steamer *Proteus* has arrived at St. Johns, N. F., from Lady Franklin bay, having accomplished her work. There is much ice in Lady Franklin bay. No tidings of the missing *Jeannette.*

THE Ameer camped on the 10th instant eight miles southeast of Candahar. Firing was heard at noon on the 10th, and from morning until 4 o'clock on the afternoon of the 11th. Access to Candahar is closed.

THERE is great damage by fires in the neighborhood of Owen sound, Parry sound, Gravenhurst, Otterville, Stratford, Eden Mills, Burton and Zurich, all in Ontario, Canada West. A million dollars' worth of timber has been burned in the Parry sound district. Cattle are dying on all sides on account of the drouth.

FRAUDULENT "AMERICAN" COTTONS.—During a recent tour through Lower Egypt an American correspondent was astonished to find at Rosetta, Damanhour, Zagazig, and especially at the great fair at Tantah, a great quantity of cotton goods for sale purporting to be of American manufacture. These goods consisted of a wretched, flimsy fabric, filled up with "sizing." A large portion of them bore the word "Mexican" in large, English letters and underneath the word "American" in large Arabic letters. The traveler found, on consulting the official report of the Director of the Egyptian Statistical Bureau, M. Amici Bey, that no American cotton goods have been entered at the regular Egyptian custom house during the past five years. A small quantity of American cotton goods have entered Egypt by way of Smyrna, where the greater part of the duty was paid; but all such goods were found upon inquiry to have been of uniform, excellent quality. The presence of the fraudulent "American" goods is explainable only on the theory that the English manufacturers, who now monopolize the Egyptian market, have found a new way of "spoiling the Egyptian," by palming off upon him their "cheapened" goods as American, and thus momentarily avoiding the consequences of their cheating in the fabric, and at the same time doing untold harm to American manufacturers.

A LARGE force of Chinamen have commenced the work of filling up a tract of low land lying in the southern end of Portland, Or., belonging to the Oregon railroad and navigation company. This tract is over a mile long and one-quarter wide, and will have to be filled to a hight of 15 or 20 ft. The estimated cost of the work is $800,000. It is the purpose of the company to use the ground for machine shops, depot and warehouses.

The Mining and Scientific Press

Established May, 1860, this has long been the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, $4 a year in advance. Sample copies, 10 cts.

DEWEY & CO., PUBLISHERS,
No. 202 Sansome St., cor. of Pine, S. F.

Traveling Agents.

We want several canvassing agents who will make it their business to solicit subscriptions and advertising for our first-class progressive newspapers. Men of ability and experience can secure good pay and permanent employment. Send references and state your past occupation, etc., to the publishers of this paper.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Yuba and Sutter counties.
D. W. KELLEHER—San Mateo and Santa Clara counties.
C. E. WETMORE—Alameda county.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct, or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

Sewing Machines.

Several first-class styles, good as new, will be sold at a bargain. Call on or address H. F. D., at this office.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We will send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

$40 RIFLE FOR ONLY $15.—The Evans 26-shot Sporting Rifle, advertised by E. G. Rideout & Co., 10 Barclay street, is a great bargain. We are positively assured that the retail price of these Rifles was $40 each; any one can get the same Rifle now by sending to the above named firm only $15. They offer to refund the money sent if the Rifle is not as represented. Read their large advertisement in this issue.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

ANNUAL STATISTICIAN of 1881.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 816 California st. Price, $4.

COFF'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Milluan, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, $7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 158 pages, embracing illustrations of furnaces, suplements and working apparatus.

It is a work of great merit, by an author whose reputation nsurpassed in his specialty.

Price, $3.00 coin, postage free.

"THE $1,000 CHALLENGE"

Ore Feeder for Quartz Mills.

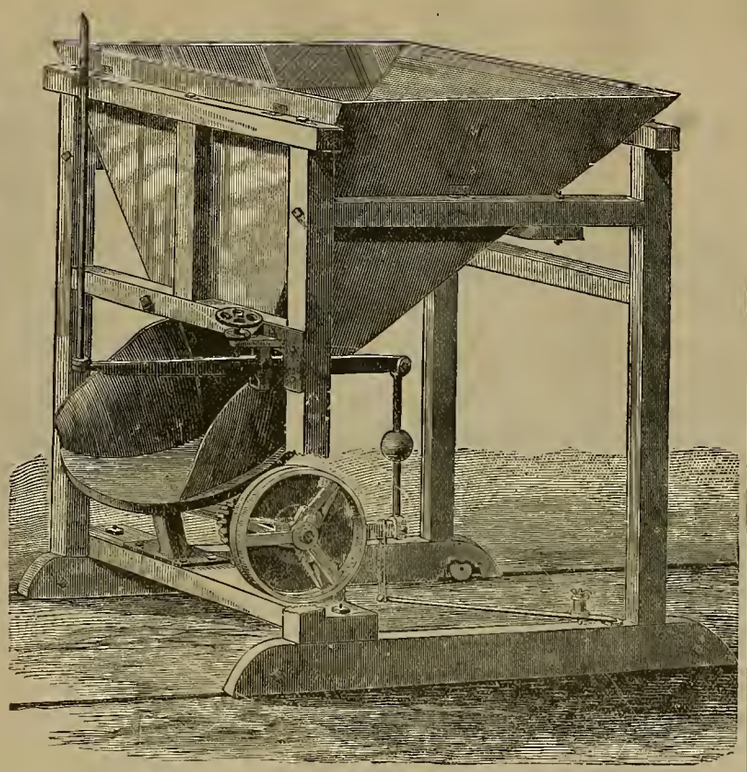
OVER 800 ARE NOW IN USE, GIVING ENTIRE SATISFACTION.

Awarded First Premium at the Tenth and Twelfth Industrial Fairs of the Mechanics' Institute.

Twenty Per Cent. More Ore Crushed with Fifteen Per Cent. Less Wear of Iron than by Hand Feeding.

The accompanying cut illustrates the recently introduced Grip, and also the Spring Attachment, which replaces the Weight berctofore used, and which are obvious improvements.

It is now fully demonstrated, after careful and long continued experimentation and practical use, that the plan upon which a perfect Ore Feeder must be constructed is that of a carrier, and not that of a shaking-table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Jerky or spasmodic contrivances will not answer the purpose for wet or sticky ores.



The Challenge Ore Feeders are now in Use in the following Mills, besides many others

Superiority of the "Challenge" Ore Feeder Demonstrated!

At the "Christy" Mill, Uintah County, Utah, the "Eclipse" Feeders, (conceived by E. Coleman) were introduced, but not carrying a regular supply of ore for the crushing capacity of the stamps, were replaced by the "Challenge," which are now running and the stamps crushing forty (40) per cent. more ore than was done by the "Eclipse."

The "Harshaw" or "Hermosa" Mill, of Patagonia District, Arizona, was also originally fitted with "Eclipse" Feeders, but after a few weeks trial they were pronounced inadequate to the work, discarded, and the "Challenge" adopted.

The "Silver King," Mill of Arizona, also removed the "Eclipse" Feeders to give place to the "Challenge."

The "Sola" Mill, of Brown's Valley, Yuba County, Cal., was fitted with "Victor" Feeders, manufactured by E. T. Steen, but proving insufficient, the "Challenge" Feeders were substituted.

Four of the "Victor" Feeders, manufactured by E. T. Steen, were also placed in the "Alexander" Mill, at Grantsville, Nevada, but after a fair trial were discarded, and Hendy's Feeders fitted, and four others of the same pattern added when the second twenty stamps were erected.

These cases are simply cited from among many similar instances, in proof of the vast superiority of the "Challenge" Feeders over all others.

JOSHUA HENDY, Agent,

Machine Works, 49 and 51 Fremont Street, San Francisco.

Manufacturer of Quartz, Saw Mill and General Machinery. Also Agent for BAKER ROTARY PRESSURE BLOWERS, and WILBRAHAM ROTARY PISTON PUMPS. P. BLAISDELL & CO.'S Machinists' Tools. HOT POLISHED SHAFTING from the Akron Iron Company, of Akron, Ohio.

Dealer in New and Second Hand Engines, Boilers, and all Descriptions of Machinery.

TONITE.

Miners! Attention!

With the approach of winter, the dangers which attend the handling and use of all Giant Powders (Nitro-Glycerine mixtures) are increased.

The lives annually sacrificed in thawing or using frozen cartridges, should be a warning to all to abandon Powders which freeze at 42° Fahrenheit. All Nitro-Glycerine Powders freeze at that temperature, and now for the first time Miners on this Coast have an opportunity to AVOID THESE DANGERS.

TONITE NEVER FREEZES!

NOR IS THERE ANY LIQUID SUBSTANCE IN IT TO LEAK OUT.

It is Always Ready for Use, as well in the Coldest Regions as the Tropics.

☞ Miners are cautioned to take no stock in the slanderous reports about TONITE circulated anonymously or otherwise by the Giant Powder Company. They are all untrue.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, SEPTEMBER 24, 1881.

VOLUME XLIII Number 13

Academy of Sciences.

The regular semi-monthly meeting of the Academy of Sciences was held on Monday evening, Vice-President J. P. Moore in the chair. Donations to the museum were as follows: Mr. Frank Miller, two specimens of the blind fish of the Mammoth cave, Ky., known as *Typhlicthys Subterraneus*; also two specimens of crustaceans from the same locality. From A. B. Stout, specimen of *Squiller maculatus*. From S. S. Montague, specimen of the *Mylolencus pulverulentus*. This is a fish found in the waters of certain warm springs in Nevada. A peculiarity is that these springs occasionally dry up. The fish has a speckled or "powdered" appearance. From John A. Palmer, of Carlin, Nevada, specimens of plants used by the Shoshone Indians for making ropes and nets; there are the *Asclepias erosa*, (Torr.) and the *Apocynum cannabinum*, (Linn.) Mr. Moore said in this connection that he had recently been investigating the fiber plants used by Indians in Arizona. He found some which might be used for making paper. An instrument was also presented, such as is used by the Shoshone Indians in dressing and tanning skins.

The donations to the mineralogical department were as follows: From H. M. Bennett, specimens of nitrate of soda from Oxford, Oneida county, Idaho; from Chas. Wolcott Brooks, clay found on railroad, Sonoma county, near Petaluma; from C. D. Gibbs, seven specimens of white rock, containing sulphurets of iron, from railroad cut near Sydney, Australia.

A new work was received from Mr. Gustav Eisen, of Fresno county, describing and delineating a curious earth worm found by him in the high Sierra. Dr. Eison has prepared a very elaborate work on the subject of "Earth Worms." This will be a quarto volume of some 300 pages, freely illustrated.

Dr. Hermann Behr read a paper on "Insecticides." In this paper he took the ground that bi-sulphide of carbon was injurious to plant life, and not necessarily fatal to insects. He maintained that the pulverized leaves of certain plants were more effective in killing insects; and that oily or fatty substances were preferable to any evaporating fluids.

Mr. J. P. Moore concurred in the views expressed by Dr. Behr. He had, while trying to kill gophers, noticed the effects on certain plants. He then applied the bi-sulphide in small quantities to certain plants. The first effects were to quicken the life of the plants, but the subsequent action was insidious, as Dr. Behr had stated. Before fall those plants that were not treated were vigorous, while those that were treated were dead. These same effects were found in experimenting on rose bushes.

Dr. Stout called attention to the danger attending the use of bi-sulphide, but thought it depended a good deal on how it was used. Was good in many instances.

Mr. J. P. Moore had, at the previous meeting, commenced a series of papers on certain diseases of the vine caused by fungi. The first paper was on the structure and growth of parasitic fungi. At the last meeting, Mr. Moore continued the subject, taking up some special forms and giving the proper method of exterminating them. Mr. Moore intends taking up other vine and fruit diseases in future papers.

Dr. Behr spoke of the reason why these fungus pests so suddenly increased. He said our tarweeds and other resinous plants had formerly protected us from them to a great extent. But now these tarweeds were destroyed to be got rid of, and they no longer protect us.

Mr. Rixford said vine cuttings were cut up and plowed in for fertilizers, usually in this country. It would be had to have to burn them. He thought also that tarweed was increasing and not decreasing, at least, in Sonoma county. If some one could find a way of utilizing tarweed they would be doing a good thing.

Mr. Moore said, as a general thing, fungoid growths do not attach themselves to plants having odors, and plants like tarweed are so strong that fungoid growths do not flourish on them.

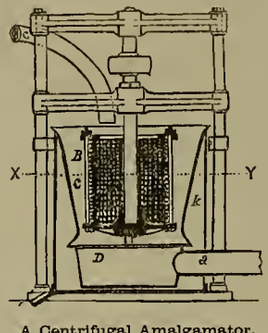
Mr. Chas. Wolcott Brooks reminded the Academy that he had read before it, a paper on the early discoveries on the Hawaiian Islands. Since that paper was published he had received confirmation of the views expressed. He described at length two carved stone images composed of lava, each about three ft. high, recently brought to this city by Mr. J. C. Pflugger, from the Hawaiian Islands, now on their way to the Imperial Museum at Berlin, Germany. Both were well carved with iron instruments, and are said to be two or three centuries older than the first visit of the great navigator, Capt. Cook, to those islands. They are thought to be highly corroborative of the early visits and discoveries of the Spanish navigators to the Hawaiian Islands in 1452, as shown by the old Spanish records. One image represents a Spanish cavalier, with Spanish features and dress, and has a large, fluted, old-style ruffle around the neck. Both are carved with iron tools, such as Capt. Cook found among the natives upon his first visit, and which fact clearly proves that some foreigners had been there before, for no mineral formation in any part of the group shows any traces of iron. It must have been imported.

Mr. Brooks announced that he had heard from Europe of the reception by Capt. Dallmann, of the Academy proceedings containing the inquiry regarding early discoveries of Wrangel Land. Capt. Dallmann, who was in command of a steamer on the coast of Norway, said he would explain his claim some time next year, after his return from a voyage to Siberia.

At this point of the proceedings a dispatch was handed to and read by the Chairman, announcing the death of the President of the United States, and the Academy immediately adjourned.

THE Tombstone *Epitaph* says: "The mining outlook for Sonora is particularly good at present. The short-sighted policy of the Mexican Government in placing such a heavy tariff on machinery, lumber, etc., amounts almost to an embargo on mining developments. Even the bullion cannot be exported without paying a heavy duty. This policy is driving away capitalists, and will work great injury to the speedy development of that country and prove a failure as a source of revenue."

CAPT. EADS is greatly encouraged over the prospects of his marine railway across the Isthmus of Tehauntepec. "My plans," he said,



A Centrifugal Amalgamator.

"have been indorsed by the most eminent engineers in Great Britain, and I have been offered all the capital I need, but I decline to accept the offer, as the scheme is distinctly American, and I want all the privileges and benefits to be derived to fall to my own country. The only consideration asked from thie government is to guarantee for 15 years at 6% dividends on $50,000,000 of stock."

THE OLD MISSION OF SAN LUIS OBISPO.

SEARCHING MINERS.—The miners employed in the Sierra Nevada and Union Consolidated mines, in the neighborhood of the reported ore strikes, are searched as they leave the mines, and have been for the past week. Whether it is being done simply as a "bull" movement, or from a real desire to keep a knowledge of the present condition of the mines from the public, it is hard to determine.

THERE is some inquiry in Utah for desirable mining property in districts close to Salt Lake.

San Luis Obispo Mission.

The early Catholic fathers who established the first civilized settlements in California, having plenty of time before them, with no railroads, telegraphs, expresses or mails, to hurry them up, took their time in selecting the sites upon which to build their missions. That they exercised care and judgment in the selection is manifest from the fact that to-day the remaining missions are centered in localities where climate is good, soil is excellent, and the surroundings are pleasant.

The early missions formed centers around which gathered the people of the country. Near by they cultivated small patches of ground or tended their flocks and herds. The missions were more numerous in the southern part of the State, and wherever the sites were, there would be formed inviting surroundings, and advantageous topographical features for such centers.

The padres were well aware of the advantages of the sea ports, and established missions at San Diego, Los Angeles, Santa Barbara, San Luis Obispo, Monterey and San Francisco. In some cases, as at Los Angeles and San Luis Obispo, the locations near the ocean not being agreeable, they wisely put their buildings back from the sea, but still near enough to reap the advantage from proximity to a sea port.

The style of all their buildings was the same; plain adobe structures, with red baked tile roofs, and a surrounding veranda, the church roof being higher than the other one-story buildings, and having a walled enclosure attached to it. The engraving shown herewith, representing the San Luis Obispo Mission, will give a good idea of the style of building. San Luis Obispo is nine miles from the harbor, and is connected by railroad. The place has much the appearance of the old Mexican towns, the old cathedral and many other adobe houses still standing. It is the center of a wool and wheat country and is now one of our thriving towns, being the only one of any size between Monterey and Santa Barbara. A great many native Californians still live in the vicinity of San Luis Obispo, and perhaps there is no better town in the State to study the types of the race.

A New Amalgamator.

Mr. P. B. Wilson, of Baltimore, Maryland, has adapted a centrifugal machine to the evaporation of the precious metals from pulp, which, briefly stated, consists in the interposition between the basket and center of the machine of an amalgamated plate, adapted to receive the contents of the revoluble basket as they are thrown off by centrifugal force.

The centrifugal machine consists of an outer casing, inside of which is the revoluble basket, which is driven in the usual way. *C* is the amalgamated plate preferably made in sections which is placed inside the casing and around the basket. The lower edge of the plate, *C*, extends below the basket, *B*, and is flared outwardly, as shown.

D, is a pan located at the bottom of the casing into which the refuse material falls, and it is furnished with an outlet pipe, *a*. The casing, *A*, is provided with a delivery pipe, *b*, for the amalgam.

The water, or the water, sand and pulp, are introduced into the revoluble basket by means of a trough or pipe, *c*, and projected from the basket by centrifugal force against the amalgamated plate, *C*, which retains the gold, the the refuse material falling to the pan, *D*. By flaring the lower edge of the plate, *C*, the amalgam is conducted past the edge of the pan, *D*, to the bottom of the casing.

THE Silver Reef *Miner*, a well conducted local paper, published at Silver Reef, Utah, has entered on its fourth volume, and donned a new dress. The *Miner* very sensibly pays close attention to local affairs and we are always sure of fresh items from it for our "Mining Summary."

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

The Mining Interest in New York.

[From Our Regular Correspondent.]

EDITORS PRESS:—The transactions at the mining boards of this city have been unusually large, with fluctuations of considerable extent. There seems to be nothing to cause the unwonted activity beyond the mere manipulations of the various cliques controlling the market. This in itself appears, to the outside speculators, sufficient reason for the sudden movements which have been made; and it is to be feared that these artificial causes for activity are beginning to be regarded as the mainstay of business rather than actual changes in the condition of the mines themselves.

Several of the wildcat stocks which have lately been placed upon the market seem to have been taken up to a large extent by the public; and their original holstering having been knocked from under them, the natural decline has occurred.

I notice that one of the newspapers making a business of puffing (for a consideration, of course) various worthless securities argues "it is getting to be a well-known fact that the men who make the most money in mining stocks are those who get in on the ground floor, in other words, buy the treasury stock at the company's office before the mine is fully developed or listed on any of the exchanges." And then follows the customary admonition: "People who are looking for such opportunities will do well to read the advertisement in this paper of the ——;" but it would be personal to mention names. This plan, however, is found by the unwary investor not to work quite so well in practice as in theory, for the insiders having sold out, there is nobody left with an interest in keeping the stock at fictitious figures. I wonder whether these innocent New Yorkers ever will learn that really good and valuable mining properties do not go begging, here or elsewhere, for want of buyers, any more than do meritorious enterprises of any other kind. There are always men with money on the watch for anything out of which more money can be made. It is only a confession of worthlessness when the dear public are invited to step up and share the good things.

Mining Items.

Articles of incorporation have been filed at Albany, of the Hamilton (Nevada) Mining Company, capital, $2,500,000; Silver Belt Company, $2,500,000; Bright Star Mining Company, capital, $2,000,000. The Eagle River Consolidated Mining Company has reduced its capital stock to $5,000,000.

The Carihou Company received, as the latest shipment, 4,055 ounces of bullion, valued at $4,700.

The Gold Stripe trustees will push further development on the mine.

The Ontario's product for 23 days of August was $151,182, assay value.

It is said that extensive reductiou works will at one be erected in the Burro mountains, New Mexico.

The Leadville *Democrat* is still loud in its praises of the Chrysolite, while the *Herald* insists that the mine is being gutted.

During the week ending August 27th, the sales at the American Mining Exchange aggregated 195,380 shares, and at the New York Mining Exchange, 517,325 shares, making a total of 712,705 shares for the two Boards in this city. Of this what proportion were wash sales and how much represented real transactions, I am unable to say. PAUL WARD.

New York, Sept. 8, 1881.

Public Lands and Mines.

EDITORS PRESS:—The importance of procuring Government title to lands, and the mode of doing so, has been one of considerable moment and some conflicting opinions. For a long time our opinion has been adverse to the law of Congress regulating the title to mines and mineral lands. Under the present laws all the public lands are being surveyed, under instructions, as we believe, that land containing minerals shall be so marked upon township plots. The law also permits homestead claims to be made to 160 acres, which has been and is being done all over the country, even where it is known to be mineral; and unless protest is made, they will no doubt be granted patents.

The law also authorizes the taking of surface mining claims by the acre in lots, and the locating of ledges of mineral-bearing rock to the amount of 1,500 ft. in length. After doing a certain amount of work—$500—be can procure a patent. Now it will be observed that there is no restriction as to number of claims each individual may take up or purchase. Hence, it will be seen that the moneyed men are busy acquiring titles to all the mines, and as soon as a patent is obtained, he may do no more work but lay them aside for future use, as interest may suggest.

This practice if continued will in 20 years as effectually lock up the mines from the poor prospector as is the case now in Georgia or any of the old States. It is even said now that the people on the line of the C. P. R. R. will not protest to the railroad company getting patents on the mineral lands in their grant, as they then will be able to compromise and get the said lands for less than they could under the mineral laws of Congress. Almost every acre of land in California, in the mineral belt, is truely mineral land, and should be held open to the free mining and prospecting.

The law of locating and owning should be so amended as to limit the number of claims or feet to any one man or company, and if not worked in some proper way within a certain time, to work a forfeiture to the Government.

AN AMERICAN MINER.

Reporting Mining Information.

When a man has but little, his general disposition is to make it appear that he is pretty well fixed. When he has much, he becomes indifferent as to appearances, or as to what others think of his circumstances. With miners this same characteristic is even stronger. When a miner finds a ledge he talks as though he was independent. When he gets a small hole in the ground, he considers his prospects first-rate and is glad to have the reporter visit him and write up his claim, but when he strikes the real stuff itself, and his mine is paying big, he suddenly becomes indifferent, and about all the reporter can then get out of him is: "Oh, yes, we are taking out a little gold, but expenses are very heavy;" or, "we are doing pretty well, but don't want anything said about it." Our experience is and has been that the man who has got but little of substantial interest to report is free with his information, while the man who could furnish an item of solid merit that would really help the district generally keeps clear of the reporter, and has but little to say when found and run down. Of course to this, as all other rules, there are exceptions, but the exceptions are not common. There are mines being worked in this part of the country now that if the truth were told of them would make a good showing, but the exact truth is difficulty to obtain. We may say "we hear" so and so, but that is not just exactly the kind of information that does the most good. Mine owners and mining superintendents could assist the publisher very materially in overcoming this difficulty if disposed to do so, and publishers would be pleased if they would. For our part we shall always be glad to know what they are doing. If their work, however, is "dead work," let them say so, and leave speculation as to what they expect out of the report. It is no discredit to a mine that a certain amount of "dead-work" has to be done on it. In all cases more or less is necessary. If they are taking out ore let them say so, and if they are crushing let them tell frankly whether it pays or whether it don't. Such mining information, reliably reported, will be read and carefully considered, and would do good. Generalities have but little weight.—*Placer Herald.*

Work Necessary to Hold a Claim.

The statute requires $100 worth of work on each claim located after May 10th, 1875, in each year, and in default thereof, authorizes the claim to be relocated by other parties, provided the first locator has not resumed work upon it. But if the first locator resumes at any time after the expiration of the year, and before any relocation is made, he thereby preserves his claim: the statute nowhere authorizes a trespass upon, or a relocation of a claim before located by another, however derelict in performing the required work the first locator may have been, provided he has returned and resumed work, and is actually engaged in developing his claim at the time the second locator enters and attempts to secure the claim.

Where one person or company owns several contiguous claims, capable of being advantageously worked together, one general system may be adopted to work such claims; and work done according to such system for the purpose of prospecting or working all such contiguous claims, although done on only one of such claims, even outside of all of them, is available to hold all such contiguous claims intended to be worked or prospected by such general system.

TIOGA DISTRICT.—This district is situated on the division line between Mono and Tuolumne counties, and its altitude is about 11,000 ft. It is on a rich mineral belt, which may be said to be in the heart of the Sierras. The scenery is grand, and at this season it is a delightful place, there being scattered about in the laps of the mountains a great number of little lakes, which are perfect amethystine gems. About Dana are some rich mines. The Great Sierra, on Tioga hill, shows a vein 6 ft. wide, on which a shaft is down 70 ft. It shows ore rich in silver. The Bevans, Sheepherder, and other mines owned and worked by Eastern capitalists are silver veins of a formation resembling the Comstock. The Bevans mine, to the north, and the Great Sierra are reached by mountain trails, which in places approach so near to the perpendicular that travelers are obliged to dismount and lead the horses and mules over them. Here found plenty of last year's—or perhaps everlasting—snow. This region has a population of about 100 persons at present.

THE Bonanza drift mine at Howland Flat, Sierra county, is paying $5,000 net per month.

Railway Progress.

There has been an unparalleled degree of activity manifested in railway construction in this country during the past decade, and at no period during that time has the increase been so great as in 1880. By decades the progress, since 1830, when there were but 23 miles in operation, is summed up as follows:

From 1830 to 1840	2,785	miles
" 1840 " 1850	6,213	"
" 1850 " 1860	21,614	"
" 1860 " 1870	22,279	"
" 1870 " 1880	40,757	"

The gross earnings per mile, which decreased continuously from 1871 down to 1878, made very little gain from the lowest point in 1879, but in 1880 leaped up at once, becoming the largest for six years. Expenses made a similar leap, yet not so far but that net earnings per mile were the largest since 1871. The average net earnings for 1880 was 5%, which is as good an average as is usually made by railroads passing through the densest populated portions of Europe.

That the impetus of railway progress for 1880 has not yet begun to decline may be inferred from the fact that 61 new railway companies have been organized in Indiana since January 1st, or more than three times the number incorporated the same time the previous year. This may be a somewhat large average for the whole country; but from information gathered from a large number of States, it is quite certain that the mileage of new track already completed and to be constructed during the year, promises to be much larger than even that of 1880.

Marking Locations.

A location of a mining claim must be distinctly marked on the ground so that its *boundaries* can be readily traced; but the law does not define, or prescribe, what kind of marks shall be made; or upon what part of the ground or claim they shall be placed. Any marking on the ground claimed, by stakes, mounds and written notices, whereby the *boundaries* be readily traced, is sufficient.

A subsequent locator has no right to object that the first location was not sufficiently marked on the ground at the time of the location, or before recording, provided that such first location was sufficiently marked on the ground before any valid subsequent location of the same claim.

After a location has been lawfully made, the right of the locator cannot be divested by the mere obliteration of the marks or the removal of the stakes without his fault, he having performed the other acts required by the statute.

MILL CREEK—LUNDY.—The population is about 400 souls, including 125 men employed at the May Lundy mine and mill. The town is delightfully situated, and is growing rapidly. New buildings are going up in all parts of the place. The town is a green valley between high mountains, and near it is a fine little lake. There is here a rich gold belt, and new discoveries are frequently made. The claims that are being worked are held at high figures, and quite a number are bonded to Eastern people. Several claims are being worked by "high privates." Not a few Eastern experts are now scouting about in this region. The following mines are being worked: May Lundy, Gorilla, Woodland, Nioma, Bryant, Kearsarge, Pike Tunnel, Curry and Homer. The following claims are being prospected: Prussia, Good Hope, Adelaide, Erie, Yellow Rose, Little Emma, Gold Bar, Gold Feather, Monitor and Northern Belle. Also several mines on Mount Scowden (which, from its shape, should be called Cathedral mountain), are being worked.

OTHER VEINS THAN THOSE DISCOVERED.—Where a valid location is made upon a vein or lode discovered, the locator is not only entitled to the vein discovered, but to every other vein or lode throughout its entire depth, the top or apex of which lies within the surface lines of the claim extending vertically downwards, to which no right had attached in favor of other parties at the time the location became valid, although such veins or lodes may so far part from a perpendicular as to extend outside of the vertical side lines.

BODIE MILLS.—At Bodie the following mills are at work: Minere' mill, working Bodie Tunnel ore; Bodie, working Bodie ore; old Standard mill, Standard ore; Bulwer-Standard, Standard ore, Noonday mill, Bechtel ore; Syndicate mill, Syndicate ore. All these mills represent about 125 stamps. The Silver Hill and Spaulding mills are not now running.

MINERS' RULES MUST BE IN FORCE.—To be of any validity, a rule or custom of miners must not only be established or enacted, but must be *in force* at the time and place of the location. It ceases to be operative whenever it falls into disuse, or is generally disregarded.

A MR. LYON has purchased of Messrs. Gross, Pierce and Buckingham their recent quartz discovery near Pleasant Valley, El Dorado county. The purchase price is said to have been $22,500; $5,900 down, and the balance in deferred payments.

THE farmers of Antelope valley are in the midst of a copper craze that promises to be of substantial benefit to that portion of Mono county.

Old Humboldt District.

A correspondent of the *Silver State* says: As there has been so many inquiries of late relative to the mining revival at this place, perhaps it may be interesting to your readers to receive information direct on the subject. Since last June everything has been very lively in the mines, and the prospects are good for Old Humboldt district to become as good a mining camp as any in the State. Judge Barbee, of Utah, is largely interested in the mines of the reorganized district. He has a large force of men at work on several claims, and thus far has been very successful in finding rich ore and developing fine-looking mines. Ore from the ledge in a tunnel 125 ft. long assays $1,500 in gold and silver to the ton, while ore from a shaft 25 ft. deep on the same ledge assays $1,800 per ton in silver. Assays from the croppings of other locations run as high as $2,000 and $3,000 per ton, and there is every indication of the permanency of the veins. In one of the mines now being developed there is plenty of ore in sight, and there is every reason for believing that the district will prove equal to any in the State. This fall Judge Barbee will erect reduction works, and reduce the ores now being extracted from his mines. He is confident of success, and says he has seen no better prospects anywhere. The Royal Con. M. Co., of New York, have bought property in the district, and intend to commence operations at once, and erect a mill shortly. This company, of which Judge G. T. Sewall, well-known to old residents of the county, is superintendent, are operating in Colorado and Arizona with marked success, and they propose engaging extensively in mining here. Assays from the croppings of several ledges belonging to this company range from $500 to $2,000 in silver to the ton. With the present prospects, I think it can be safely said that the outlook for this district is as bright as any in the country.

SWEETWATER.—The Bodie *Free Press* says: Considerable excitement was created in town Wednesday by the reported rich strike in one of the Sweetwater mines. Upon inquiry it was learned that Dr. Summers had on exhibition in Boone & Wright's store some good looking rock taken from his claim in Patterson district. The ore was taken out of a large ledge, and proves to be rich in silver. The ledge formation is said to be almost 20 ft. wide. The Doctor and his friends are confident that they have a mine. Martin Jones came in Wednesday evening from the district and is perfectly satisfied with the outlook. He is interested in a claim called the Great Western. So far it shows up well. All those operating in that section speak in glowing terms of the outlook. The formation is good and it bes every indication of being permanent. The discovery made by Dr. Summers is of great value to the district.

SEWING MACHINE NEEDLES.—The single town of Brockton, Mass., now manufactures more sewing machine needles than all of Europe combined. They are turned out by the million and shipped all over the world. The needle, of the best steel, passes through 30 different hands in the manufacture before leaving the factory; it is of various sizes and shapes, curved, straight, two-eyed (twin holes), and the cheapest costs three-quarters of a cent.

CLASSIFICATION OF CALIFORNIA INDUSTRIES.—A general classification of the population of the State of California as to industries is set down as follows:

Commercial towns	268,609
Agricultural towns	92,017
Mining towns	36,701
Mixed industries	45,214
Farm, mine and hamlet	427,415
Total	864,636

A FRENCH journal the other day published a table showing that the average wages in 51 distinct trades were only 60½ cts. a day, or $3 63 a week. These were the wages of men. For women the average in 11 trades is 31½ cts. a day, or $1.87½ a week. Decorative sculptors, a class of highly skilled and intelligent workmen, receive only 62½ cts. a day.

THE Nevada *Transcript* is 21 years old. We are always sure in picking up this exchange to find something of interest, as it pays close attention to local affairs, and its mining items show care and intelligence in their preparation. The paper has just attained its majority and we hope to be able to congratulate it at the end of another 21 years.

IT is reported that in the region of Rock creek, north of Auburn, there is being experienced quite a mining boom. Machinery is being hauled out that way, and arrangements are making for commencing operations on several ledges that for some time have remained comparatively idle.

THE Salt Lake *Tribune* says: Parties who have recently visited Pinon hill report the ore bodies in sight in the Climax and Rebellion as simply immense. If that hill was worked for all there is in it, employment would be given to hundreds of miners and the Park would rival Leadville.

FOR CHURCH BUILDING.—It is said by Lord Shaftsbury that not less than $180,000,000 have been spent in England for church building during the present century.

MECHANICAL PROGRESS.

Floor Building.

So few of the floors constructed in new houses are, says the *Building News*, equal to their work, that the attention of architects and builders might be profitably called to the subject. In going over some of the newly-erected houses in the suburbs of London, it is not infrequent that one finds dwelling house floors which have sunken so much in the center as to destroy the comfortable assurance that they are safe. These instances occur chiefly in houses erected by speculative builders, who seem to be under no regulation of any kind in respect of floor timbers. * * * Many practical builders have a conviction that if a timber as a joist has a larger cross section than another it must be stronger. Thus they fancy a piece of timber 8 inches by 3 inches, which equals 24 square inches in sectional area, cannot be so strong as a piece 5 inches by 6 inches which has 30 inches in area. The fact is, the smaller piece is the strongest of the two if both are placed upon edge, as every one knows who has studied the principles on which the strength of beams depends. It is easy to convince the most practical of this seemingly inexplicable fact. If two beams of like size are placed side by side, the two will resist twice the amount of one of the pieces. This is so self-evident that experiment is not needed to establish the fact; in the same way, three beams will resist three times as much as one, and so on of any number. In plain English, when lengths and depths are equal, a beam of six inches in breadth will bear three times as much as one of two inches in breadth. It may be shown by experiment quite as readily that the strength increases more rapidly with the depth. In point of fact, another law of proportion is observed—namely, that having two beams of the same breadth and length but of different depth, the strength increases more rapidly than the depth; thus it is found a beam nine inches deep bears more than three times as much as one only three inches deep. These are very simple statements derived from facts and experiments and no complex conception of the resistance of certain fibers on both sides of a neutral axis, or quotations in algebra, are required to establish them.

In dwellings the load on a floor is chiefly made up of furniture, though this is generally placed, at least the heavier articles, round the walls of rooms. The space occupied by tables and other objects in the center of a room reduces the available standing area, and thus, for all ordinary floors, 70 lbs. per superficial foot may be calculated for as the full load in extreme cases. Rules founded upon the resistance of beams to rupture are, however, of little use, as the floors may be seriously affected by deflection, and deflection is directly as the cube of the length. In regarding stiffness, the load per foot has been given by one authority as 90 lbs. per foot, including weight of materials. It makes all the difference to place joists an inch nearer, though builders like to give as much interval as they can, for economy's sake. Instead of joists being placed 12 inches apart, it is often-er to find them 13 inches or even 14 inches, and the consequence is a scantling which has been found to answer in a well-built house fails when it is introduced with a greater distance or interval. Then the modern speculative builder's floor is seldom properly stiffened by cross bridging. There is only one row instead of two or more. Of course no practical man will deny the advantage of bridging his floor joists. It helps wonderfully to prevent deflection under a concentrated load, for the joist immediately beneath the load is relieved of direct strain, and the joists on each side take a share of the weight. Generally it may be taken that a properly bridged floor is capable of sustaining, without mere deflection, twice as much load as the same floor without bridging, so that the cost of the introduction is amply repaid.

Discarded Experiments.

A very bright mechanic was telling, a few days ago, how he constructed an improvement that promises to be of some future use and profit hereafter, from castaway "contraptions" found in the "glory-hole" of the establishment in which he is employed. From his partial enumeration of the contrivances and their parts he found in the unused attic is evident that the proprietors have suffered some considerable loss from uncompleted experiments, in material and waste of time of hands. It is a little singular that in taking account of stock these wastes do not figure in the inventory. It is certain they represent time, and labor, and material—and dollars. And as such representatives they ought to be reckoned, for the benefit of proprietors and stockholders. Somebody must pay for this work and this thrownaway trash, as it all costs. How much of the cost comes direct upon the owners and stockholders perhaps nobody knows; and how much of the results might be utilized nobody seems to care. It would seem to be good policy to make an overhauling of "glory holes" once a year, and when the contents are condemned by proper authority, like a State or national commission, have them sold "to the highest bidder."

This, however, would be a rough and perhaps injudicious method of getting rid of what is not presently valuable, and by exposing the skeleton in the closet of the company. It might be better to have a private, occasional overhauling by judicious workmen and a selection of refuse that might be worked up into useful material or possible machines.

"Out of sight, out of mind" is an old saying, and some of the attempts that illustrated the hard struggles of inventors are forgotten because they have been put away out of sight. And yet there are forgotten contrivances in many old established shops that would suggest and aid present mechanics and future inventors, if they could have access to them. In some of these old establishments the writer has found the neglected embryo of improvements that have brought name and money to the enterprising re-inventor and perfector. Not long ago, in rummaging over an unused attic in an establishment of more than 30 years ago, was found a complete model of a contrivance now in successful and profitable operation, that has made money for its patentee, and yet he did not steal the idea; he merely re-invented it, without a knowledge of the work of his predecessor, who was too lax to use his discovery profitably, or was deterred from business attempt by discouraging counsel. It may pay to look after the future of discarded experiments.—*Boston Journal of Commerce.*

Mechanical Terms.

The technical terms which are in use do not seem to be generally comprehended by the majority of our mechanics and engineers, from the fact that a large number of terms are in use which mean one and the same thing.

The distinction particularly between the terms force, power and work, is not clearly understood.

Dynamics is the science of that branch of mechanics which treats of force in motion, power and work. It comprehends the action of all kinds of machines, manual and animal labor, in transformation of physical work.

Element is an essential principle which can not be resolved into two or more different principles. The simple physical elements of dynamics are force, velocity and time, and the functions of those elements are power, space and work.

Function is any compound result or product of two or more different elements.

A function is resolved by dividing it with one or more of its elements.

Force is any action which can be expressed simply by weight, and which can be realized only by an equal amount of reaction, and is the first element in dynamics.

All bodies in nature possess the incessant virtues of attracting and repelling one another, which action is recognized as force.

Velocity is speed or rate of motion, and is the second element in dynamics.

Time implies a continuous perception, recognized as duration, or that measured by a clock, and is the third element in dynamics.

Power is the product of force and velocity; that is to say, a force multiplied by the velocity with which it is acting is the power in operation. Power is the differential of work or any action which produces work, whether mental or physical. Power multiplied by the time of action is work—work divided by time is power.

Work is the product obtained by multiplying together the three simple elements force, velocity and time.—*American Machinist.*

COTTON DUCK FOR ROOFING PURPOSES.—The use of cotton duck for roofing purposes is exciting a good deal of interest among agents of cotton mills now building. The Lawrence Duck Company, Lawrence, have one-half of one of their mills roofed with duck, and though over a year since it was put on, it now appears as good as new. The Pacific Mills have also tested it with the most satisfactory results. These two roofs have been examined recently by experts, who found the material to have retained its bright appearance without any deterioration or apparent injury to the fiber. The Globe Yarn Mills, Fall River, have adopted it for their new mill, and it is also in use by some few other companies. It will be to the interest of cotton manufacturers to give this material a thorough trial, as the success of it would give new life to the cotton manufacturing business and open up, at home, a demand almost without a limit, and quiet the fears of those who are alarmed at the thought of over-prodoction and the necessity for more extended foreign markets for cotton goods.

GENERAL PATTERSON ON AMERICAN MACHINERY.—In a recent letter, General Patterson, of Philadelphia, recently deceased, said: The Americans make the best machinery to be found anywhere. I have sold all the English machinery in my several mills for what I could get, and have replaced it with the product of the Brideshurg (Pennsylvania) Manufacturing Company, and in consequence have saved as much from the increased production and improved quality of the same as the new machinery cost. I now have all my mills in perfect running order, but I pity the men who bought the English machinery. There is no State in this country more interested in the protection of American machinery and American industries of all kinds than Georgia; next to Georgia come Alabama and Tennessee with cotton, iron ore, and coal in the greatest abundance, a good climate, and water power sufficient to run any amount of machinery.

SCIENTIFIC PROGRESS.

Mechanics in Surgery.

Dr. W. G. A. Bonwill, of Philadelphia, has recently invented and put in actual practice, a mechanical appliance for superseding the use of hand tools in surgery. Although this is not the first instance of the introduction of the higher refinements of mechanics into the practice of surgery, it is nevertheless quite a step in advance, both in the comprehensiveness of the machinery and its varied applications, over anything which has preceded it.

The apparatus has been for some time in use in several of our principal Eastern cities, where it is received with much favor by leading surgeons. Quite recently it has been brought to the attention of English surgeons, at the session of a Medical Congress, where it has been described and commented upon as follows:

"Our American friends have always been foremost in devising mechanical appliances for superseding manual labor, and Dr. Bonwill's is the latest which has been brought under our notice. Besides saving labor, the present machine tends to redeem from something of barbarism certain surgical operations, particularly amputations. As well as being the latest addition to the list of labor-saving appliances, it is, perhaps, the most startling, inasmuch as the amputation of a limb may now be effected by the aid of machinery, just as conveniently as hair-brushing is.

"The surgical engine of Dr. Bonwill consists of an iron standard carrying an arrangement of multiplying wheel gear, which, by means of an endless cord passing over pulleys, transmits rapid rotary motion to either small drills or very fine circular saws, as the case may be. These instruments are attached to the end of a series of rods connected by universal joints, which permit the operator to move the cutting instrument in any direction he pleases while it is revolving at an incredibly high speed. It will, of course, be understood that these instruments are intended to deal only with bone. Thus with the drill it was shown that in cases where it is desired to hold the parts of a fractured bone together in a certain position, holes can be drilled and pins inserted, which, being held in a steel frame, keep the parts exactly in position. With the circular saw it was demonstrated that pieces of any required shape can easily be cut out of and removed from a bone, or a bone can be cut through in a few seconds.

"For amputations, a small, straight saw can be used. It is simply fitted into the holder, and as it is attached to a small eccentric worked from the main gearing, it has a very rapid reciprocating action imparted to it when the gearing is put in motion, which is done by means of a small hand-wheel. The comparatively slow movement of the hand of the operator is here replaced by the inconceivably rapid motion of the mechanical saw. By this means not only is the time occupied in the operation greatly shortened, but the operation itself is much more neatly performed, owing to the smallness of the cutting instrument and the high speed at which it is moved.

"Dr. Bonwill is certainly entitled to the thanks of the medical profession, and no less those of the suffering public, for having dedicated his invention to their free service. We may add that this is not the only adaptation of mechanical means to surgical ends devised by Dr. Bonwill. He has made several other applications of machinery in minor surgery.

THE PHYSICAL CONSTITUTION OF MATTER.—We clip the following paragraph from an article on "What is a Molecule?" in *Popular Science Monthly*, for September: "Modern science declares that every substance consists of an aggregation of extremely small particles, which are called molecules. Thus, if we conceive a drop of water magnified to the size of the earth, each molecule being magnified to the same extent, it would exhibit a structure about as coarse-grained as shot; and these particles represent real masses of matter, which, however, are incapable of further subdivision without decomposition. A lump of sugar, crushed to the finest powder, retains its qualities; dissolved in water, the mass is divided into its molecules, which are still particles of sugar, though they are far too small to be seen by the highest powers of the microscope. The physical subdivision of every body is limited by the dimensions of its molecules; but the chemist can carry the process further. He 'decomposes,' or breaks up, these molecules into 'atoms;' but the parts thus obtained have no longer the qualities of the original substance. Hence the molecule may be considered as the smallest part of a substance in which its qualities inhere; and every molecule, though physically invisible, can be broken up chemically into atoms, which are themselves the molecules of other and elementary bodies."

HEAT FROM EXPLOSIVES.—When, say MM. Sarrau and Vielle, an explosive is decomposed, the heat liberated is equal to the exact excess of the heat of formation of the products over the heat of formation of the explosive. If, then, the heat liberated by decomposition be known, and the composition of the products of the reaction be known, as well, the heat of formation may be ascertained.

THE ELECTRIC LIGHT.—At the last meeting of the French Academy of Sciences, M. Jamin communicated a "discovery" relating to the electric light. He has found that when the electric arc is produced in a closed globe (not exhausted) in which the air cannot of course be renewed, the carbon burns away until all the oxygen is consumed. So soon, however, as the chemical phenomena of combustion are complete the arc increases in size and becomes fixed, so that the oscillations of the light disappear completely. Moreover, the consumption of carbon is diminished to two millimeters per hour, so that a carbon "candle" of 30 centimeters will last 150 hours. This improvement obviates the necessity of renewing the carbons every day. The discovery, however, is by no means a new one, and Mr. Sawyer and other experimentalists deny its practicability.

POWERFUL EXPLOSIVE COMPOUND.—Berthollet's fulminating silver is a very dangerous substance which results from the action of ammonia on oxide of silver. A very good receipt for producing it, is as follows: Digest freshly precipitated oxide of silver in strong liquor of ammonia for 12 or 15 hours, then pour off the liquid, and cautiously dry the black crystalline powder which remains and which is the fulminate. Also the decanted ammonia contains some fulminate, and this will be deposited on cooling after gentle warming of the liquid or on spontaneous evaporation. Only a few grains of oxide of silver should be used in a single operation. This is an excedingly powerful and dangerous explosive, the properties of which are but little known though it was discovered in the last century. It is mentioned in but few of the books on chemistry.

DEMAGNETIZING WATCHES.—Since the introduction of dynamo-electric machines a good many valuable watches have been almost completely ruined by having their works magnetized. Mr. Maxim, the electrician, has, however, invented a machine, now at the Paris Exhibition, which in a few minutes completely demagnetizes a watch, leaving it as free in its movements as ever. By mechanical arrangements the watch to be demagnetized is given a compound rotary motion near a revolving electro-magnet, and is at the same time gradually withdrawn from the latter's influence. The theory is that the watch is subjected to rapid reversals of polarity in a gradually weakened magnetic field until the final reversals are practically *nil*. At all events, the machine restores to running order a watch so thoroughly magnetized as to be incapable of making a single stroke of the escapement lever.

THE ROOT OF THE COTTON PLANT.—Mr. W. C. Staehle, an American chemist, has discovered a curious new product in the bark of the root of the cotton plant (*Gossypium herbacium*). When the bark of this root is exhausted by alcohol of the specific gravity of 0.84, a dark reddish-brown liquid is obtained, which when distilled to recover the spirit, leaves a resinous matter which amounts to 8% of the original weight of the bark. The new product thus obtained appears black and shining, but when pulverized takes the color of cochineal. It dissolves in 14 parts of alcohol, 15 parts of chloroform, and 122 parts of benzol. It dissolves also in caustic alkalies, and is precipitated from these solutions by acids. Hydrate of potash colors green. Sulphuric acid dissolves it with a red-brown color. Its other properties have not yet been examined.

A NEW SOURCE FOR CITRIC ACID.—At present, lime juice, from which citric acid is made, has to be imported into the United States, but the New York *Commercial Advertiser* says it could easily be produced from the fruits growing in Florida, if only sufficient energy were put into the work. Efforts are now being made to induce the lime and lemon growers of the south to prepare the lime-juice, and if this should prove successful, there being no reason why it should not, the entire production and manufacture of citric acid will be kept in the country, saving hundreds of thousands of dollars annually, and developing another great industry.

CONDENSATION IN STEAM WARMING PIPES.—Ordinary steam pipes used for heating purposes in a room having and maintaining a temperature of 60°, will, with an uninterrupted circulation, condense .357 lb. of water per hour for each square foot of surface of pipe, while a coil, under like circumstances, will condense .29 lb of water per hour per square foot of surface.

AMBER.—Much of the amber, as it is found, is in small pieces. In order to give additional value to them, a large number of smaller pieces are ingeniously joined together so as to form one of larger size. This is accomplished by moisteuing two surfaces of amber with potash, warming them to the proper degree and pressing them together. Still smaller pieces are joined by exposing them, covered with sand in an iron pot, to the action of heat for 40 hours, or boiling it for 20 hours in rape oil, when the material will become transparent and the pieces will fuse together. As vessels and other objects of great size made of amber have come down to us from remote times, the fact suggests the probability that the art of molding and working amber in some such manner was known and practiced by the ancients.

New Incorporations.

The following companies have been incorporated and papers filed in the offics of ths Superior Court, Dspartment No. 10, San Francisco:

HASTINGS CON. M. Co.—Sept. 17th. Location, Arizona. Capital stock, $50,000,000. Directors, C. C. Hastings, D. T. Elmore, Chas. H. Mann, L. H. Newton, and Chas. J. Swift.

MONO LAKE HYDRAULIC M. Co.- Sept. 17th. Location, California. Capital stock, $1,000,000. Directors, John W. Wilson, Daniel E. Jones, John Elbert, George Duncan and John E. Curtis.

DETROIT COPPER M. Co.—Sept. 17th. Capital stock, $1,000,000. Directors, John Elbert, D. E. Jones, John E. Wilson, John E. Ourtis and Jeremiah Dwyer.

NEVADA COUNTY CON. M. Co.—Sept. 21st. Location, Union Hill district. Capital stock, $10,000. Directors, E. B. Clement, Ferdinand Vassault, Thaddeus S. Fitch, Joseph W. McClung, J. C. Angell.

SILVER FLAKE M. Co.—Sept. 21st. Location, Arizona. Capital stock, $1,000,000. Directors, Philip Gerold, J. M. Prather, Julius Fay, James P. Rountree, Jr., Abraham Halsey.

COMPROMISE G. M. Co.—Sept. 21st. Location, Mariposa Co., Cal. Capital stock, $5,000,000. Directors, C. H. Light, A. D. Allen, James H. Gates, David B. Hunt, Daniel Buck.

THE boundary of Coos and Douglas counties, Oregon, where the coast range is crossed by the Coos Bay wagon road, is involved in uncertainty, and a serious question has arisen between the two counties with regard to the collection of taxes.

MINING SHAREHOLDERS' DIRECTORY.

The Mining Share Market.

There has been more movement in the stock market than usnal, notwithstanding the general gloom in business circles, caused hy the death of the President. Still, the market has not heen as active as last week. Our stock tahles show the fnctnations. Nothing is known yet of Sierra Nevada, whether there really is ore there or not. The *Enterprise* says: Althongh the exact condition of the hottom of the joint Sierra Nevada and Union Con. winzs is not at present made known, we have Senator Fair's word to the effect that sufficient ore made its appearance at that point to cause him to believe that what had heen found was a substantial hody of ore, and no mere feeder or stringer. Although reticent in regard to what has been done since that time—for reasons hest known to himself and the Directors of the company—we know that work for the development of the deposit is heing pushed as rapidly as possihle, and also know that some specimens of good ore have heen brought to the snrface.

As there is a strong flow of water, and as this must he raised hy donkey pumps a distance of about 250 ft., it is evident that the work of sinking cannot be very rapid, yet the management appear to he well satisfied with what is heing shown np.

While the ventilation is good to the northward of the Ophir incline, to the southward of that point it is not yet all that could he desired, hut will donhtless he improved when the suction fan goes into operation at the top of the Consolidated Virginia shaft.

The diamond drill has been put into the joint Consolidated Virginia and Best & Belcher east crosscut on the 2300 level. Drillings assaying as high as $8 per ton are heing ohtained. This is very encouraging for hoth the companies named.

The following diepatch from Eureka gives news of a rich strike there: There is considerable excitement here over a strike in the Eureka tunnel, an enterprise inaugurated fonr years ago hy Gen. P. E. Connor. The tnnnel penetrates Prospect mountain over a mile south of the Ruhy Hill mine. It has heen generally helieved that the Ruhy Hill ore channel extended through Prospect monntain, and this strike demonstrates that it does. The development was made about 800 ft. below the surface. The ore assays from $600 to $1,000 to the ton. The hody is strong and improving honrly. It is chiefly important as establishing the continnity of the Ruhy Hill ore channel along to the sonthward. The tnnnel is in the natnre of a private enterprise, and the stock is not listed on any Board.

Ventilating Bonanza Mines.

In our "Mining Summary" will he seen references to the improved ventilation expected at several of the Comstock mines, when the hig suction wheel gets into operation, the heat heing excessive at many points. The *Enterprise* of recent date, in speaking of the preparations for setting the wheel says: Preparations are heing made for setting np at the top of the old Con. Virginia shaft a wheel 30 ft. in diameter, which, hy heing rapidly revolved, will draw the air up the shaft, and thus increase the ventilation in the lower levels of the California and Con. Virginia mines. As the boilers are still standing in their house near the top of the shaft, all ready for use, it will cost hut little to set the snction wheel in motion. The wheel will be erected under the large platform now seen surrounding the curhing of the top of the shaft, which platform was formerly the first floor of the hoisting works.

There is now a very good circulation of air northward from the Ophir iucline, hut to the sonthward, through the California and Coo. Virginia gronnd, the draft is quite eluggish and the heat so great that oporations are well nigh suspended at most points.

We understand that a blower or hlowers will also he set up at the hottom of the shaft, pipes from which will he run up to a proper hight, and air hlown up the shaft. Thus a strong current of air will for a time he forced np through the shaft. Once such a current has been fully estahlished, it is expected that the wheel and hlowers can he stopped and taken out. The wheel, however, will he kept in readiness to he used at any future time should the circulation of air again become sluggish through connections made at points to the eastward in the lower levels.

Bullion Shipments.

We quote shipments since our last, and shall he pleased to receive fnrther reports:

Germania, 13th, $3,500; Hanauer, 13th, $2,160; Stormont, 13th, $3,485; Horn Silver, 13th, $5,000; Frisco, 13th, $10,020; Tintic, 13th, $21,010; Germania, 14th, $7,000; Horn Silver, 14th, $7,500; Frisco, 14th, $2.230; Mammoth, 14th, $2,700; Horn Silver, 15th, $5,000; Barhee & Walker, 16th, $1,528; Nevada, 17th, $1,350; Stormont, 17th, $3,475; Germania, 17th, $4,900.

BEING unahle to ohtain the right of way over placer claims south of Butte, Montana, the Utah & Northern will not hnild the road to that place.

MINING SUMMARY.

The following is mostly condensed from journals publisbed in tbe interior, in proximity to tbe mines mentioned.

CALIFORNIA.

AMADOR.

SLABTOWN GRAVEL CLAIM.—Amador *Ledger*, Sept. 17: This claim at Slabtown bas recently been fitted up with hydraulic power by Messrs. Hatfield, Miner, & Co., of San Francisco. Tbey obtain the water supply from the big canal, and have put tbe old Butte ditch in order to convey water from the canal to tbe claims. One giant bas been operating about two weeks, with from 150 to 200 inches of water. The gravel looks well, and it is thought by good judges that tbe claim will prove remunerative.

JACKMAN.—A sample crusbing of rock from this mine, comprising from 20 to 30 tons, has just been finished at tbe Monterichard mill. We have not heard how it turned out.

MISCELLANEOUS.—All the water has been taken from the Volunteer shaft. The calculation is to sink to a considerable depth before drifting. C. Peters has completed taking the water out of the sbaft of the Brown Co's. claim, near Jackson. He has retimbered the sbaft tboroughly, and done other necessary work.

CALAVERAS.

THE GWIN MINE.—Calaveras *Chronicle*, Sept. 17: Leaving Mokelumne Hill in the morning, after a ride of about 6 miles we reached the famous Gwin mine, one of the finest pieces of mining property in the State, and one wbich for many years past has been yielding up its wealth of precious metal. There are splendid hoisting works on the mine, 2 quartz mills, the upper mill having 32 stamps, and the lower one 24, sulphuret works, and in fact everything that is necessary for working ore. Through the kindness of Mr. Wm. M. Gwin, Jr., who is at present personally superintending the mine, we received the following information: The pumps are in excellent order and running and no trouble is experienced from the water. The work of retimbering the old shaft is now completed down to the 600 level, the tunnel repaired and everything is about ready to commence hoisting ore. There is a large reserve of good quality ore in the level which will supply 100 tons of rock a day for a year. Work is still being done in the 400 level, showing very rich rock in the upper stopes of the level. Some difficulty is experienced to get it owing to the heavy caves in the lower stopes. Work is being done in the 400 level in the north sbaft. A large body of ore was tapped in the Smith ground recently purchased by the company. A tunnel on the surface on the Smith ground was run about 50 ft on the ledge, which is from 6 to 8 ft in width and fair grade ore. The prospects of the mine are very favorable, and it will soon be on a handsome paying basis.

CAMPO SECO was once one of the liveliest mining camps in the State, but at present presenting little of its former business activity. There is a little placer mining carried on in the vicinity during the season when water in obtainable, but at this season of the year mining operations must necessarily be suspended for want of water. Quartz abounds in the vicinity, and we understand it is the intention of prospecting some of the ledges.

MILLS.—*Mountain Echo*, Sept. 13: The noisy stamps of both our mills are in motion, and the hauling of quartz through our streets is an enlivening feature. Moss & Stooe's mill is working ore from the Buck Horn, a mine whose reputation has been established some time ago. Next week the mill will run on Eddie Dewalt, quartz. This mine has been opened over two years, but no rock has ever been worked from it. It is situated near Murphy's, in one of the richest localities in this vicinity. The quartz is considered high-grade and good results may be expected. Work on the Oro Plata still continues, with excellent results. The company is so well satisfied with their prospects that they have recently purchased an adjoining mine from Page Cutting. This mine was formerly worked by the Blue Wing Co., 20 years ago. Ore of exceediug richness has been taken from it. Work on the Union Water Co's. reservoir is drawing towards completion. In the end of the present month this fine structure, it is expected, will have been finished. The dam is highly spoken of and reflects credit upon the arti-ans engaged on it. Its capacity has been largely increased, and in seasons like the present will be of incalculable advantage to mines in this vicinity.

THE Hite mine and mill are idle at present. Extensive improvements are being made. A 140 horse-power compressor with a 64-inch cylinder is being put in. The power is obtained from the sand-mill, about 4,000 ft below on the river. The dam is also being repaired. A new shaft is being sunk from the lower level, which produces better ore than has been taken from the mine for some time. With the additional facilities herein named and the excellent prospect of a fine body of ore before them, the Hite G. M. Co. is assured of success in the near future.

MODESTO SILVER M. Co.—The works of this mine have been of late somewhat retarded, but not wholly so, on account of some irregularity occurring in the business of the Co., which we understand is fixed up satisfactory, and the work of sinking the shaft and taking out ore is being continued. The shaft is at present about 210 ft. deep, with a vein of 16 inches, and has the appearance of increasing in width as the shaft goes down. The ore taken from the bottom of the shaft, which has been carefully examined by outside parties, is estimated at $400 a ton. The Co. has already upon the dump fully 100 tons of ore, which is estimated worth from $200 to $400 a ton. The present Supt., Mr. Scribner, stated to one of our business men of the town that with a proper mill he could soon pay all cost heretofore incurred, besides keeping up expenses of running the mill and extracting ore from the mine. The Co. has in contemplation the erection of a mill as soon as practicable.

ELDORADO.

MINING IMPROVEMENTS.—*Mountain Democrat*, Sept. 17: Dan Wickham has taken a contract to build a 10-stamp mill and hoisting works on Texas hill, this city, for which the Blair brothers have contracted to furnish 20,000 ft of lumber, a large portion of which is already delivered. Supt. Aldersly, of the Chapparal and Gopher-Bowlder mines, is preparing to put up 10 additional stamps in the new mill at the Bowlder mine. Sam. Sample, of San Francisco, and his associates, are preparing to put up substantial works on the "Old Judge" mine, which has a very promising 4½ foot ledge of high average ore.

DRIFTING.—Georgetown *Gazette*: The mining claim owned by Dams & Jacott on Slate creek, about a mile from town, is being worked by Jacott & Adney. They have kin side their hydraulic and started a drift which is now in about 40 ft on the channel, with every indication of a hill channel. It is well defined, and they think if they strike hard bed rock heavy wash gold will be met with. The bed rock is now soft and pays about $2 per day.

INYO.

PANAMINT.—Inyo *Independent*, Sept. 17: A short time ago some conscienceless liar from Panamint reported to some New York party here that the big mill at Panamint, now the property of the Inyo Con. M. & M. Co. of New York, has been running on waste rock. Now, the situation of Panamint, having at present no mail facilities or regular communication with the county seat, renders it difficult to obtain mining reports from there—we have only been enabled to mention the frequent bullion shipments to Darwin, and approximate its value by the weight. We have obtained, however, some data going to show where the "waste" came from, out of which the dividend —or dividends—were declared. During the two runs the mill worked ore from the Hemlock and Wyomiog mines aggregating $12 000; 10 tons from the Mariposa, worth $146.50 per ton; from the Erie, 3 tons; Magnet, 12; Ophir, 9, besides lots from mines belonging to Bastian, Smith, Carberry and others. The ores last mentioned averaged $150 per ton. Most mine and mill owners would be thankful for a considerable quantity of such "waste."

The whole yield, up to our latest information, was 25 bars of bullion, 900 fine, weighing 80 lbs each. There is rich ore in all the mines and on all the dumps, and the old camp has taken a very decided jump ahead.

MODOCK.—Frank Fitzgerald, lessee of the Modock mines and furnaces at Lookout, has taken out 70 tons of ore so far, and continues extracting it at the rate of 5 carloads daily, or about 4 tons. Deering & Welch have about 45 tons of lead ore, average car samples 111 ounces silver per ton; 47% lead. Barrow & Co. commenced work on the 24 instant on a seam of ore 2 inches wide. It has since opened out to a ledge 2 ft 9 inches wide, and getting larger every shift. Average car samples of this ore is 205 ounces of silver per ton. It is the most important strike that has been made in the mine for the last 2 years. Will commence to get in coal in 2 weeks and will start furnace about the 20th of October, on Modock and Minnietta ore. Will have about 90 tons of the latter.

MARIPOSA.

WASHINGTON.—Mariposa *Gazette*, Sept. 17: The Washington mine is putting in new and costly improvements, which is evidence of a good mine and permanency. The new improvements consist of a 55-inch tubular boiler, a new skip, a large compressor, and are using the Ingersoll drill, which gives good satisfaction. They are now sinking 200 ft below the 1400-ft level, which gives 200 ft stope to an 8-ft vein, which appears at the 1400-ft. The mill will be in readiness for a fresh start in 8 or 10 days, with a prospect more favorable than ever before

THE NUMBER NINE, more recently called the Yosemite mill and mine, is now running 55 stamps, and crush 40 tons per day. Since the completion of the pipe they have plenty of water for all purposes. Under the new management, with Frank Thorn as Supt.; Alex Mason, a first-class engineer, and Henry Gerkrts, a No. 1 amalgamator, the mine is fast proving itself a success. The first clean-up of the mill under the new administration the rock averaged between $6 and $7 per ton, and the second, which occurred recently, the rock paid $9 a ton. Mr. Thorn, Supt., is running the mill with five less men than formerly under Mr. Boise, and is making it by amalgamating in the batteries, using fine screens and limiting each stamp to a ton and a half of ore every 24 hours, instead of 3 tons as formerly. The No. 9 promises to be a success, notwithstanding the cloud thrown upon it by a former administration.

MONO.

MAY LUNDY.—Homer *Index*, Sept. 17: The additional 5 stamps placed in the mill have been running all the week, and working admirably. The self-feeder has not yet been attached to the new battery, but will in a short time. The mill building has been greatly enlarged, in order to house numerous improvements now under way. Two large pans and a settler are to be put in, one of the pans being now in the building. Three lines of blanket sluices are to be extended to the end of the new east wing of the building, from which point they will return to the southeastern corner of the old building and pour the tailings into a V flume, fed by water from the tail race, which will conduct them into a lower amalgamator placed at the eastern base of the present tailings dump. The foundation for the new amalgamator has been completed, and the machinery is now on the road. It requires nothing but water to operate it.

NEVADA.

A TERRIBLE SLIDE.—North San Juan *Times*, Sept. 17: A terrific slide occurred at the Blue Point mine at Moore's Flat last week, which completely covered up the works of the company, and caused the stoppage of all work at the mine. From 50 to 75 men were thrown out of employment by the operation. The whole top ground, acres in extent, slid in. Happily, the workmen saw the slide coming, and prepared for it. They moved the tools, the monitors and the loose mining apparatus, including hose, pipes, etc. It will require from a month to 6 weeks steady washing with a thousand inches of water to place the mine in the condition it was before the slide occurred. Mr. Brigham, the manager of the mine, will set men to work in a day or so to construct a drift tunnel into the mine for the purpose of working it by the drifting process, until hydraulicing can be resumed.

MILL.—*Transcript*, Sept. 10: The Mt. Auburn Mining Co. has positively concluded to put up a mill on its property, to crush the immense quantity of ore that has been opened up. The plans for the construction of it are about ready. Mining locations are on the increase, and it shows that prospectors are still at work. We believe that in the course of a year or so our quartz mines will be doubled in numbers and many grand developments will be made.

NEW YORK AND BROOKLYN MINE.—*Transcript*, Sept. 18: We are assured that the prospecting operations being carried on at the "Wilson Ranch" in Willow valley, this district, by the New York and Brooklyn Q. M. Co. are leading to very satisfactory results. The ledges have been tapped in 5 or 6 different places by tunnels, shafts and pits, and considerable promising looking ore is ready for milling. Some of the N. Y. gentlemen interested in the claim are now on their way here, and will arrive in a few days. They, will, according to present intentions, make arrangements as soon as they come for systematically developing the ground on an extensive scale, among other things having the erection of the hoisting works begun.

PLACER.

RICH ROCK.—Placer *Herald*, Sept. 17: T. J. Hunter had some very rich rock with him in town last Saturday which he had just taken from his mine in Duncan Hill. This same ledge turned out some exceptionally rich rock about a year ago, and from the appearance of the specimens lately taken out, its richness is by no means exhausted.

RICH COPPER ORE.—J. M. Bryan, who is prospecting for gold near the Good Friday, has come upon an uncommonly rich lead of copper ore. We were shown some specimens last Monday by Samuel Kaiser, which were almost pure copper. Kaiser informs us that the copper deposit is very extensive. What a strike this would have been 10 or 17 years ago, during the copper excitement. There will yet come a day when these rich copper mines will pay.

PLUMAS.

RICH IRON ORE.—Greenville *Bulletin*, Sept. 14: Mr. Meylert brought over some specimens of iron ore from the great mine near Quincy, which look almost like cast iron. Mr. Henry Kellogg, now living at Spanish Ranch forged a horse shoe direct from this ore some years ago.

SAN DIEGO.

THE ORIFLAMME MINE.—Cor. San Diego *Union*, Sept. 12: The first crushing commenced a few days ago at the Oriflamme mine under its new management. The 10-stamp mill is in excellent running order, and is now crushing some pretty fair ore. The mine is looking well, and a force is engaged in running tunnels and sinking a shaft on the 125 level. At this depth the vein is 4 ft wide, and as the excavations progress the showing of gold becomes more encouraging. At the 100 level the miners are doing some extensive stoping. Here the quartz is of a good character and runs very even. The ore is shipped from the mine to the mill in small cars, down a steep tramway, about 450 ft, and is dumped into the mill back of the stamps, where it is received by a man who breaks it into small pieces. This ore is then fed into the battery where it is reduced by the stamps so as to pass through a fine sieve. In a pulpy state it passes over the copper plates that are thoroughly coated with quicksilver, which attracts the gold. This mixture is then washed in concentrators, which separates the sulphurets from the pulp.

SISKIYOU.

AUTUMN WORK IN THE RIVER MINES.—Yreka *Journal*, Sept. 17: The Centennial Co., just below Virginia Bar, on the Klamath river, have found very good prospects at present working, and will undoubtedly strike big pay when they near the bedrock. The Yreka Creek M. Co. are unable to obtain sufficient water for running the elevator and giants more than one-third of the time, and are now busy when waiting between times for water, in removing the huge boulders found in the bed of the creek. A correspondent writes us that Virginia Bar is a lively mining camp, and in another year will show still greater improvement and prosperity, as all the mines in the vicinity are looking well, some extraordinarily so. The Kanaka claim looks as good as ever, and the men are taking out great quantities of gold all the time. The Centennial Co. are also doing well at present. They took out one boulder the other day, from which $10 was realized, the gold sticking to the rock and cement. The boys were rather excited over the prospect at the time, some exhibiting smiling faces, and one in particular feeling so good, that he tried to stand on his head on the boulder containing the gold. The Fort Jones Co. are now putting on night shifts, which indicates good prospects, as they have undoubtedly a good paying claim. The Mott claim is paying well, and the Portuguese Co. and China Co., as well as all the other companies seem to be doing well. Messrs. Fletcher & Wright, of Oro Fino, are busy preparing for the winter, in sawing out blocks for sluices and otherwise fixing up to commence piping with their hydraulic when water comes. Other hydraulic miners in the same locality, are also making similar preparations, all anticipating a profitable season during the winter and following spring. The Chinese Co., at the mouth of Scott river are hoisting out gravel, and are believed to be realizing good prospects. Martin, Andrews & Co., working just below the mouth of Scott river, in the old channels of both Scott and Klamath rivers, are about ready to pump out, and will soon commence making a cut inside of their wing-dam, some 80 or 90 ft long by 50 ft wide, with the intention of going down 30 ft before trying to get any pay. Their wing-dam is 400 ft long, and they have two line derricks, which being operated day and night, will get away with the channel gravel quite lively. If the heavy rains hold off until December or the end of November, this Co. will no doubt take out a big pile of gold.

SIERRA.

RUNNING.—*Mountain Messenger*, Sept. 17: The Gold Bluff mill is running day and night, and the rock is paying well.

PIPE.—Heavy 20-inch pipe for the Good Hope mine arrived last Wednesday.

WORK ON the Extension's arrangements for pumping water are about completed.

NEVADA.

WASHOE DISTRICT.

CALIFORNIA.—*Enterprise*, Sept. 20: No sinking has been done in the winzes below the 2500 level, as the mine has been too hot to allow of work being advantageously done. A large fan is being erected at the old Con. Virginia shaft (by the several companies that will benefited thereby), which will render the mines cool and pleasant.

CON. VIRGINIA.—No work has been done in the mine the past week, except in the retimbering of the various drifts which were closed during the time the old stopes were on fire. We have drifted east 85 ft from the east end of the joint crosscut of the Best & Belcher on the 2300 level. The rock passed through by the drill is hard, with seams of quartz. The best assay obtained was $8.

OPHIR.—On the 2700 level the south drift has been run the past week 21 ft. The material passed through has been quartz, clay and porphyry. The ground is dry. On the 29 level the east drift from the joint Mexican winze has been extended 18 ft, passing through quartz, clay and porphyry, giving low assays. Are reopening the old Simonton tunnel, which runs under the little ore vein opened by Rowe on the croppings of this mine in 1859-60.

UNION CON.—On the 2700 level the west drift from the joint Sierra Nevada winze has been discontinued for fear of water. The joint Sierra Nevada east drift from the shaft has been extended 26 ft, and winze sunk and timbered 10 ft.

MEXICAN.—On the 2900 level the east drift from the joint Ophir winze has been extended 18 ft, and has passed into a mixture of quartz, clay and porphyry, giving low assays

SIERRA NEVADA —On the 2500 level east crosscut No. 1 has been extended 17 ft; No. 2 advanced 31 ft, and No. 4 30 ft. The main north lateral drift has been extended 22 ft. On the 2700 level the joint Union Con. east drift from the shaft has been extended 20 ft, and winze sunk and timbered 16 ft.

YELLOW JACKET.—The north lateral drift on the 3000 level has been run 35 ft during the past week, making the present length 212 ft. The ground continues hard and dry. The quantity of water pumped continues the same. The Belcher & Crown Point pumps are not running.

NEW WELLS-FARGO.—The south lateral drift on the 500 level has been thoroughly timbered, and the drift extended 10 ft, following the east clay of the vein. The formation still continues to look well.

ALTA.—The 2150 pumps were started up last night, and all the machinery is working well, although the contemplated change in the pumping engine has not yet been made.

BRISTOL DISTRICT.

RESUMED.—Pioche *Record*, Sept. 10: The late mining boom has enthused new life into many, prospectors particularly so, as work is to be resumed upon several promising mining claims next week, and several have been stimulated to a renewed search for the rich "float" ledge near the Bristol tunnel and Loro Vale ground.

THE Mayflower is a veritable honanza and shows a larger body of ore in sight than any other mine in southeastern Nevada, one winze having been put through $100 rock for 50 ft, with no walls. Where has it an equal in this section of the State?

THE furnace of the Day S. M. Co. has been thoroughly overhauled and every thing is now in readiness for starting up next week. More teams have been put on, and from 20 to 30 tons of ore are coming down daily.

THE Bristol Co.'s mill will probably start up the latter part of next week. The base bullion piled up at the Day furnace looks very pretty.

CANDELARIA DISTRICT.

NORTHERN BELLE.—*True Fissure*, Sept. 17: The development in the 11th level is furnished with a good grade of ore. The 10th level is looking very well, showing a good body of ore. There is no material change in levels above, except between the 5th and 6th, where the ore has widened and looks quite promising. The development above the 4th shows no change of consequence. There are being extracted and sent to the mills about 85 tons of ore daily. Both mills are running steadily and doing good work. Bullion shipments for week ending September 14th, $27,-984.78. Shipments on September account to September 14th, $42,487.21.

MOUNT DIABLO.—The face of the west drift on the 2d level shows a small streak of ore, and has advanced 13 ft. A stope has been started about 25 ft above the west drift on the 2d level, and shows a ledge of ore from 2 to 2½ ft in width. The ore assays from $80 to $90 per ton. On the 1st level a winze has been started in the east drift, about 30 ft east, and shows a good streak of ore assaying $100. The drift in the foot wall, on this level, and west of the shaft, looks very well.

CHERRY CREEK DISTRICT.

NO MEN WANTED.—Cor. Eureka *Sentinel*: In a late issue it is stated there are no idle men here who are willing to work. I do not know who your informant was, but this much I do know, that he is an infernal liar; for I am sure I am willing to work. Yet I have been idle for the past three months in spite of my best endeavors to prevent it. I even offered to go and cut wood for $1 25 a cord among the Italians; yet, so help me God, I was refused that. I daily see idle men all around me complain of the lack of employment. I am sure the large majority of them are willing to work if they can get it. In conclusion, let me assure you that I know of no place where miners, millmen, or workingmen of any kind are more likely to be in a state of enforced idleness than in Cherry Creek at the present time.

GARFIELD DISTRICT.

SINKING FOR WATER.—Candelaria *True Fissure*, Sept. 17: Realizing the necessity of its uses, both present and future, and the labor attending the packing of water into their camp at Garfield district, Messrs. Johl and McDonald have commenced digging a well. They are already down 143 ft, at which point work has been temporarily suspended. The swaying of the bucket against the sides of the shaft tends to loosen the dirt, which falls upon those at work below, inconveniencing their operations. Wooden guides will be put in at once, and it is thought water will be struck at a depth of 300 ft; if not, the work will be pushed to a level of 500 ft.

SAFFORD DISTRICT.

EXCITEMENT INCREASING.—*Silver State*, Sept. 17: The railroad boys say the excitement over the mines of Safford district is increasing rather than diminishing. A dozen or more persons go there daily, but visitors as well as mine owners, have to go to Palisade every night, as there are no accommodations at the mines. D. H. Haskell, town site agent, returned yesterday from the mines. He says a side track is to be built immediately, so that trains can pass each other there, and freight can be unloaded. Dow Huntsman has selected a site for a hotel, and he will have accommodations for the public in a few days, so that the men will not be obliged to go to Palisade every night. The mines improve in appearance daily as they are being opened. A remarkably fine body of free milling ore has been exposed on the Contention claim, which experts say is proving to be the best mine yet discovered, not excepting the Onondaga. L. L. Rickard intends to put on a stage line next week between the side track at the new town of Mohawk and the mines.

STAR DISTRICT.

AN IMPORTANT STRIKE.—*Silver State*, Sept. 16: District Attorney McMillan, who has been on a visit to Unionville, says he was informed by Peter Woolcock, Superintendent of the De Soto mine in Star, that they have the finest body of ore in sight ever seen in the mine. The De Soto was located as an extension of the Shoba, in early days, and both yielded considerable rich ore and the stock sold at a high price. For years past Peter Woolcock has been at work with a small force of men on the De Soto. Occasionally he would find a bunch of good ore, which he extracted and shipped to San Francisco, to pay expenses. Now, he has a large ledge of rich ore, which has every indication of being permanent. This will probably stimulate the Shoba Co, and others owning mines on the Shoba belt to resume operations.

ARIZONA.

SILVER DISTRICT.—*Arizona Sentinel*, Sept. 17; Mr. S. S. Draper, general manager of the Red Cloud O. and S. M. Co., having resigned, Mr. Knapp, of New York, has been appointed in his stead, and the entire management changed on the Silent mine. We trust this is but the initiative step toward a thorough development, and the practical, earnest mining proper on this truly remarkable and exceedingly valuable property. The pick strike was made in cut No. 2. There is 6 ft of a friable quartz that pulverizes from a blow of the pick, and is of all the variegated hues of the rainbow, the yellow oxides of lead and a deep green color predominating. The ore seam, which runs with the trend of the ledge, is from 4 inches to 2 ft in width, of gray carbonate and black sulphuret ore, and several lateral seams of the same character coming in, in descent, with occasional kidneys or nuggets, of pure black sulphurets encountered in the intervening spaces, so soft that it may be whittled like soap.

OUR southern Arizona mining camps excel this county in the pleasant surroundings of "babbling brook and verdant vale;" but over all hangs the baleful curse of their Indian troubles, and already does it reckound to the benefit of Silver district. Inquiries are coming from capitalists as to the general standing of this district, and the opportunities for investment, etc. To all such we would say: No danger from Indians need be apprehended in this flourishing district, and the opportunities for acquiring valuable mines where the facilities for working, contiguous to the Colorado river and steamer landings, rail and telegraphic communication, but 45 miles distant, prove it is excelled by no other mining camp in the Territory.

WORK RESUMED.—Globe *Chronicle*, Sept. 15: We are glad to state that work has been resumed on all the principal properties in the district, and it is to be hoped that there will be no further suspension of work on account of the Indians. The machinery for the Globe City mill having arrived last week, was soon put in place, and the stamps have been making a continual clatter ever since.

MAM MORRIS MILL.—Has received a portion of its supplies so long detained by the floods, and has started up again. The property is still strongly guarded against the Indians. The main shaft has reached a point 420 ft from the surface, and a drift is being run to connect with the two winzes now nearing the 400 level. These two winzes both in ore all the way down, showing larger bodies than ever before encountered in the mine. Ore from the winze in the main vein, 70 ft below the 3d level, assayed $1,493. The mill and mine are in a condition to pay dividends before Christmas.

SOUTH PIONEER.—A new double compartment and well timbered shaft has been started in the South Pioneer, which is down 15 ft. The shaft is intended for the main working shaft of the mine, and it will probably strike the vein at a depth of 125 ft.

CENTENNIAD – We are advised by letter from the New York that the Centennial company would soon resume operations at their excellent property, and it is probable that a mill will be erected within a few months.

OLD DOMINION.—The smelting and hoisting works of the Old Dominion copper company have reached San Carlos, and in all probability will arrive at the mines within the next week.

NOTES.—We have learned through a reliable source that a rich strike was made one day last week on the east extension of the Rescue, and ore assaying as high as $9,-000 was taken from the ledge. This rich streak is quite narrow, being near the surface, but it is stated that the indications for widening are very favorable.

COLORADO.

MONTEZUMA.—*Courier*, Sept. 15: The Oem City M. Co., Montezuma, owns about a dozen claims in that vicinity, among which are the Monarch, Sunburst and Wyoming. The Wyoming is in litigation with the owners of the Harrison lode, but it is thought that the fight will not be a long one.

A STRIKE of a 2-ft vein of solid galena has been made in the Hunkadora lode, on Independence mountain, owned by Henry, Kehoe, Murphy & Co.

THE LITTLE JACK PROPERTY.—The crosscut tunnel which is being driven for the Little Jack lode, the western extension of the Colorado Central, on Independence mountain, is now in 90 ft, and progressing at the rate of 60 to 70 ft per month, three 8-hour shifts being employed at driving it. When the lode is reached it will be 500 ft long and over 250 ft below the surface. The shaft on the lode is about 30 ft deep, showing improvement as it goes down. The ore vein has been continuous from the surface, there being from 2 to 5 inches of ore and quartz that mills from 200 to 300 ozs of silver to the ton. Last week another regular vein, about 18 inches from the one they have followed from the surface, made its appearance, it being about 5 inches thick, and assays from 400 to 800 ozs.

WILLIAMS FORK STRIKE.—Georgetown *Courier*, Sept. 15: We have mentioned the strike of a large body of galena ore on Williams fork by Thos. Webb and others of this place. On Saturday two of the boys came over to town and brought with them a chunk of ore that weighed about 40 lbs, and assays over 200 ozs of silver to the ton. The vein was struck in an adit that had been run through slide a distance of 65 ft. The lode is called the Bobtail, and is owned by Thos. Webb, John Sanders, Cyrus Berriman & John Olds. They received an offer of $15,000 for one-fourth interest, which was refused.

BUFFALO RANGE.—Dr. R. B. Weiser returned on Saturday from the Buffalo range, and brought with him a number of specimens of ore from the lodes that he is interested in, which show the size and character of the ore veins, and prove that he has struck a honanza. The lodes are situated on Red peak.

DAKOTA.

DIES FOR THE HOMESTAKE MILLS.—Black Hills *Miner*, Sept. 12: The Homestake company has been in the habit of manufacturing here at home the iron work needed at their mills, when it was possible to do so. The stamp dies which fall upon the rock, and the bottom sinks or shoes which sustain the blows wear out very fast from almost incessant use, and have to be frequently replaced The company has been successful in casting the shoes strong enough to stand the heavy weights falling upon them; but in spite of all that has been done, cannot manufacture dies that will stand the jar—they break off at the neck. What the secret of their manufacture may be has not been discovered here, but they have to be imported at a heavy expense. Some 300 are now here awaiting transportation to the mill.

A PRIVATE HYDRAULIC ENTERPRISE.—Judge Clagget and A. J. Simmins, who have been laboring industriously for some time past in getting water on their extensive gravel claims in the vicinity of the Whitewood falls, have at last successfully accomplished their labors. Enough prospecting has been done and sufficient developments made to insure the success of their enterprise. The gravel prospects are very rich. Next spring, the very moment the weather permits, water will be turned in and work commenced at once. We have no doubt ample fortunes will reward these gentlemen for their enterprise.

MONTANA.

MOULTON.—Butte *Miner*, Sept. 13: The ore vein is large, and considerable rich ore is hoisted daily, and is accumulating for the new 40-stamp mill, which is nearing completion very rapidly. The mill will be running in a very short time.

MORNING STAR.—At this mine, to the east of Montana street, the work of sinking the main shaft to a depth of 200 ft is being vigorously pushed ahead. The new boilers afford an abundance of steam power to run the hoisting machinery and two pumps.

MOOSE.—This mine, which lies a short distance from the east end of the Magna Charter mine, has been bonded for the sum of $75,000, the bond running for the space of 90 days. The owners of the Moose—Messrs. Farrer, Johnson & Co.—have bonded the mine to S. Longmaid & Co., who, it is supposed, are operating for Eastern capitalists.

ANSELMO.—This mine, which has been so successfully opened and operated by Mr. Joe Loncaff for over one year, is looking first-rate. Loncaff's lease of the Anselmo runs about 8 months yet, and it is currently reported that he has sold the remaining time for working the mine, which expires next March, for the sum of $20,000.

ORIGINAL.—Nine men are employed. Ten tons of ore are coming out daily. First-class ore samples over 100 ozs, and second-class 40 ozs in silver to the ton.

NOTES.—The Belle of Butte is still yielding a large amount of ore daily, of good grade. The ore goes to the Silver Bow mill for treatment. Sinking the main shaft of the Star West mine progresses steadily. The shaft has been dropped over 180 ft. The Gagnon mine, famous for its steady production of high-grade ore for years past, is producing a large amount of good grade ore. Col. Thornton, who is now superintending the Gagnon, has the mine in such shape that an immense amount of ore can be readily extracted. Work at the main shaft of the Orey Rock mine is carried on without stopping. When the mine is tapped 300 ft deep, veins of as good ore as are to be found in the Butte district will be opened.

GLOSTER.—Cor. Helena *Independent:* Perhaps a few words from this lively camp would be of interest to readers. It may not generally be known that in a short time we will have 80 stamps running on the ores from the Gloster mine, more than can be found in Vestal, Mt. Pleasant, Belmont and Marysville combined, and, if I am not mistaken, it will be the largest quartz mill (60 stamps) under one roof in Montana Territory. The new 60-stamp mill now in course of construction is located at a point one-half mile below the mine. Ten more stamps will be immediately added to the present 10-stamp mill now running so successfully at the mine, which will make a total of 80 stamps. The tramway, half a mile long, to convey the ores from the mine to the new mill, to supply the 60 stamps, is now nearing completion. The credit of planning and superintending the building of this splendid mill is due to Mr. T. W. Fisher. Mr. Everett, an experienced engineer and machinist from Chicago, has arrived, and will set up and run the new engine. Mr. Skinner has charge of the construction of the tramway. Mr. Alex. Swan has control and management of the mine, mill and hoisting works. About 100 men are now employed by the company; also have a saw mill constantly running in the gulch.

NEW MEXICO.

STEEPLE ROCK.—Las Vegas *Mining World:* Everything is prosperous about the Steeple Rock district. The roads are bad at present, but it is proposed to build a good wagon road at a cost of $1,000 from the district to Lordsburg, on the Southern Pacific, the nearest railroad point. The Carlisle Co. has bonded all its properties to Western capitalists. The contract for sinking the 100-ft shaft on the Scorpion has been let and is now down 25 ft. This shows ore running 45% copper and 80 to 95 ounces silver per ton.

VERA CRUZ.—The Vera Cruz vein is located in the Tucson mountains, about 12 miles south of White Oaks, and runs in a northeasterly and southwesterly direction. The surface croppings have an inclination with the mountain side of about 45 degrees, and show for a about 800 ft in length, with an average width of from 60 to 70 ft. The croppings nearly everywhere on the surface prospect free gold in the pan. Two tunnels have been cut across the vein, one cutting it at a depth of about 60 ft, and the lower one at 120 ft. These tunnels show the formation to be true, and that it has never been disturbed by volcanic or orupttive matter. The gold is fine, bright, and perfectly free in the rock; mill run tests have been made from all parts of the vein, which prove it to average from $8 to $10 in value from wall to wall. The net profit of milling this rock with a mill at the mine will not be less than from $4 to $6 per ton, if managed with ordinary economy. Prospect wells have been dug which demonstrate plenty of water for all purposes. A company has been organized with ample capital to put in machinery especially to work the ore from this mine.

THE business men of Las Cruces have offered sufficient inducements to secure the location of the smelter which the Philadelphia Co., represented by Mr. Hoopes, contemplate erecting to reduce the ores of the Organ mountain mines, at this place.

TAOS NOTES.—*News and Press*, Sept. 12: Mining in and around Taos is beginning to assume some proportions. Several parties from the East have taken hold of mines on the Arroyo Hondo and are going to shove thing lively. On the Staples claim two shafts are being sent down 100 ft each. On the Dolo Knowell there is a 3-ft vein of mineral that will run from 200 to 300 ounces; they are getting it out and sacking ready for shipment as fast as possible. The Santa Fe Tunnel Co. are driving things lively with a fine prospect in sight; they are employing all the help they can possibly work. Many other claims are being developed rapidly and show fine mineral. On the Picuris mining has come to a system more than any other camp. Shade and Reily are putting up an improved arastra to work ore that runs $80 in gold, and 8 to 10 ounces in silver. On Rio Houdo mining and prospecting is steadily going on and I learn the mines are showing up well and all the miners there have confidence in the future of that camp.

UTAH.

DELAYS AT THE MILL.—Silver Reef *Miner*, Sept. 15: The light bullion shipment for the week, was occasioned by accident and stoppage at all the mills. The Barbee was idle from the 1st to the 8th inclusive, receiving a new cylinder head to the engine, and other repairs to the machinery. The Christy and Stormont each met with detentions on account of injury to machinery, all of which has been repaired, and are now running smoothly. The bullion product for the month will be materially lessened in consequence of this cause alone.

PARTIES up from Orand gulch report everything progressing satisfactory at that place. There is no trouble experienced by the present management in working the copper ores of that district.

Game Laws of the State of California.

We give herewith the complete game laws of the Stste of California, with all the amendments to 1881 inclusive:

These laws form part of the Penal Code of California, and come under Title XV "Miscellaneous Crimes." Chapter I of this title relates to violation of the laws for the preservation of game and fish. We give the law by sections and number as printed in the statute books, and "sub-head" the paragraphs, so that the subjcct matter is easily found. As these laws ought to he where they may he constantly referred to, hy residents of the country where fish and game ahound, we suggest that they he cut out of the PRESS and preserved.

Killing Quail, Duck, Etc.

Section 626. Every person who in any of the counties of this State, hetween the 15th day of March and the 15th day of Septsmher in each year, hunts, pursues, takes, kills or destroys quail, partridges or grouse, or any kind of duck, or rail, or marsh hens, is guilty of a misdemeanor.

Dovae.

Every person who in the State of California, hetween the 1st day of January and the 1st day of July in each year, hunts, pursues, takes, kills, or destroys doves is guilty of a misdemeanor.

Eggs of Wild Duck.

Every person who at any time takes, gathers, or destroys the eggs of any mallard, wood, or summer duck. red-head, teal, gadwell, or gray duck, or any other species of wild duck is guilty of a misdemeanor.

Having Game in Poseassion.

Every person who shall have any of the aforesaid game, or any male deer or buck, or any female deer or doe, or any antelops, elk or mountain sheep in his possession at a time when it is unlawful to kill the same, as provided by this section or hy section 628 of this Code, is guilty of a misdemeanor, and proof of the possession of any of the aforesaid game at a time when it is nnlawful to kill the same within the county wherein the same is found shall be prima facie evidence, in any prosecution for a violation of any of the provisions of this section that the person or persons in whose possession the same is found, took, killed or destroyed the same in the county wherein the same is found, during the period when it was unlawful to take, kill, or destroy the same.

627. Rspealed hy section 626.

Bucks.

628. Every person who betwcen the 1st day of Novemher in each year and the 1st day of July of the following year, hunts, pursues, takes, kills or destroys any male deer or buck is guilty of a misdemeanor.

Doe, Antalope, Elk and Mountain Sheep.

Every person who shall for the period of four years from and after the passage of this act, pursue, hunt, take, kill or destroy any antelope, elk, or mountain sheep, or female deer or doe, shall be guilty of a misdemeanor.

Spotted Fawn.

Every psrson who, after the passage of this act, shall kill any spotted fawn, shall he guilty of a misdemeanor.

Killing for Skine Alone.

Every person who, after the passage of this act, shall take, kill or destroy any of the animals mentioned in this section, at any time, unless the carcass of such animal is used or preserved hy the person slaying it, or is sold for food, is guilty of a misdemeanor.

Buying, Salling or Having in Poseession.

629. Every person who huys, sells, or has in his possession any of the game enumerated in the two preceding sections, within the time the taking or killing thereof is prohihited, except such as are tamed or kept for show or curiosity, is guilty of a misdemeanor.

Uaa of Phoephorous.

630. Every person who, in the counties of Santa Clara, Contra Costa, San Joaquin, Santa Cruz, or San Mateo, uses or distrihutes phosphorous upon any land or ground, hetween the first day of March and the first day of Novemher, in any year, is guilty of a misdemeanor.

Trapping Quail, etc.

631. Any person or persons who shall at any time net, pound, weir, cage, or trap any quail, partridge, or grouse, and any person or persons who shall sell or give away, or have in his or their possession any qnail, partridge, or grouse, that have been snared, captured, or taken, in or hy means of any net, pound, weir, cage, or trap, is guilty of a misdemeanor.

Catching Trout.

632. Every person who, in the counties of Santa Clara, Alpine, Santa Cruz, Lake, San Marin, Placer, Nevada, Plumas, Sierra, San Mateo, Monterey, Sonoma, Tuolumne, Alameda, Luis Ohispo, Solsno, Mariposa, Mendocino, or Napa, at any time, takes or catches any tront, except with hook and line, is guilty of a misdemeanor.

Close Saason for Trout.

633. Every person who takes, catches or kills any speckled trout, hrook or salmon trout, or any variety of trout, hetween the 1st day of November and the 1st day of April in the following year, is guilty of a misdemeanor.

Close Seaeon for Salmon.

634. Every person who, between the 31st day of July and the 1st day of Septemher of each year, takes or cstches, huys, sells, or has in his possession, any fresh salmon, is guilty of a misdemeanor.

Natting Salmon Saturdays and Sundaya.

Every person who shall set or draw, or assist in setting or drawing any net or seine, for the purpose of taking or catching salmon in any of the waters of this State at any time, hstween sunrise of each Saturday and 12 o'clock noon of the following Sunday, is guilty of a misdemeanor.

Cloea Season for Shad.

Every person who, hetween the 1st day of April and the 31st day of December in each year, takes or catches, huys or sells, or has in his possession, any fresh shad, is guilty of a misdemeanor.

Tide-Watar Fishing.

Nothing in this section shall he so construed as to prohibit any person from catching fish, with hook and line, at any time in the tide waters of this State.

Daleteriona Suhstancea in Watar.

635. Every person who places, or allows to pass into any of the waters of this State, any lime, gas tar, cocolns indicus, or any other suhstance deleterious to fish, is guilty of a misdemeanor; provided that sawdust shall not he deemed a deleterious suhstance.

Privata Fieh Praservas.

Any person who shall catch, take, or carry away any trout or other fish from any stream, pond or reservoir helonging to any person or corporation without the consent of the owner thereof, which strcam, pond or reservoir has heen stocked with fish hy hatching therein eggs or spawn, or hy placing the same therein, is guilty of a misdemeanor.

Standing Nats and Traps for Fish.

636. Every person who shall set, use or continue, or who shall assist in setting, using or continuing any pound, wsir, set net, trap, or other fixed or permanent contrivance for catching fish in the waters of this State, is guilty of a misdemeanor.

Saines and Nets.

Every person who shall cast, extend or set any seine or net of any kind for the catching of fish in any river, stream or slough of this State which shall extend more than one-third across the width of said river, stream or slough at the time and place of such fishing, is guilty of a misdemeanor.

Fieh too Small for Markat.

Every psrson who, by seine or any othsr means, shall catch the young fish of any species, which at the time of capture are too small to he marketed, and who shall not return the same to the water immediately and alive, or who shall sell or offer for sale any such fish, fresh or dried, is guilty of a misdemeanor.

Penaltiee.

Every person convicted of a violation of any of the provisions of this chapter shall he punished hy fine of not less than $50 and not more than $300, or imprisonment in the county jail of the county where the offense was committed for not less than 30 daya nor more than six months, or hy hoth such fine and imprisonment.

Who Recaiva tha Finaa.

One-half of all moneys collected for fines for violations of the provisions of this chapter shall he paid to informers, and one-half thereof to the District Attorney of the county in which the action is prosecuted; all other costs shall he charged against the county in which the action is proscouted.

Fish Commissioners.

Nothing in this chapter shall he construed to prohibit the United States Fish Commissioners, or tho Fish Commissioners of the State of California, from taking such fish as they shall deem necessary for the purpose of artificial hatching, nor at any time.

Forfeitura of Boats, Nats, etc.

All nets, seines, fishing tackle, hoats, or other implements used in catching or taking fish in violation of the provisions of this chapter shall he forfeited, and may he seized by the peace officer of the county, or assistant, or person acting under the Fish Commissioners, and may he hy them destroyed, or may he sold at puhlic auction hy the party making such seizure, upon notice posted in such county for five days.

Proceads of Forfeiturae.

The psrson making such seizure and sale shall he entitled to retain one-half of the proceeds of such sale, and the halance shall he paid into the school fund of the county, in case the seizure and sale is made hy a peace officer thereof, or to the Fish Commissioners, if made hy a person appointed hy them; provided, that all nets having meshes of less than one and half inches in size, when seized under the provisions of this section, must he destroyed.

California State Sportsman's Association.

EDITORS PRESS:—Your letter of inquiry as to the aims and the necessity of organization, we would briefly answer thusly: Throughout our Golden State dwell many true sportsmen who take a rnn with rod and gun for the enjoyment of the sport as *sport* and *recreation*; and with alarm at the rapid decrease of sundry kinds of game in regions where it should naturally increase, and with disgust at the selfishness of those who will not give any kind of game a chance for its life, have these same sportsmen returned home time after time. Giant powder, nets of wee, small-sized meshes, snares and spring nets, traps, and such like paraphernalia have, in some localities, well nigh made a clean sweep of fish and game, add to which a total disregard for the existence of open or close season. And what chance have we of finding in a very short time, a fish or a bird, or game of any kind in California? And, too, in a State long and justly termed the "Sportsman's Paradise." By only a limited observance of the game and fish laws as now in force, there will be enough and abundance to spare for all time. This and a natural feeling of goodfellowship, such as always exists among those of similar tastes, drew together at Stockton, as a central point, on Monday, June 27th, in Eureka Engine Co.'s hall, delegates representing ten clubs—Pajaro Valley Club, Watsonville; Folsom Club, of Folsom; Butte County Club, of Chico; Ukiah Club, of Mendocine; California Wing Shooting Club, and the Cosmopolitan Club, of San Francisco; Yolo Club, of Woodland; Stockton Gun Club; O'Neil Club, of San Joaquin, and Woodbridge Club; and a more harmonious meeting throughout cannot be imagined. A full and complete canvass of the situation was had; Constitution, By-laws and two sets of shooting rules adopted, and the intention was to have every portion of the ground so fully covered there should no question arise, bnt our by-laws and rules would cover it (we will forward you copy soon as printed). After electing as officers for the year,

Park Henshaw, Butte County Sportsman's Club, Chico, President; Dr. F. C. Durant, of Folsom Sportsmsn's Club, Folsom, Vice President; Sidney Newell, Esq., Stockton Gun Club, Treasurer; J. Pitcher Spooner, O'Neil Gun Club, of San Joaquin, Stockton, as Secretary. Directors, Crittenden Rohinson, of California Wing Shooting Club, San Francisco; J. H. Burnett, of Ukiah Sportsman's Club, Ukiah; C. H. Wyckoff, of Yolo County Sportsman's Clnh, Woodland; C. B. Smith, of Stockton Gun Club, Stockton; J. N. Besse, of Pajaro Valley Sportsman's Club, Watsonville, adjourned to meet second Monday in May, 1882, at parlors of Palace hotel, San Francisco. We have already heard from several noted clubs, among them Grass Valley Club, signifying their intention to join the association. Under our rules, none hut members of the association will be allowed to participate with us in association tournaments. Our strength at starting was most gratifying to all, and there seems no reason why the California State Sportsman's Association should not he one of mutual henefit to its members, as well as all sportsmen in our State.—J. P. SPOONER, Secretary California Stste Sportsman's Association.

Hunting Upon Enclosed Lands.

On the 3rd of March, 1876, the Legislature of California passed an act to prevent persons passing through enclosures and leaving them open, by tearing down fences or otherwise, and to prevent hunting upon enclosed lands in the State of California. We append the sections of this law, and as it is an important one to hunters they may as well cut it ont of the columns of tha SCIENTIFIC PRESS and paste it up where it can be readily found for reference:

Gata, Bars and Fancae.

Section 1. Every person who shall open any gate, hars, or fence of another, for the purpose of passing through, and shall wilfully leave the same open, without the permission of the owner, is guilty of a misdemeanor.

Fancae on Inclosed Lande.

Sec. 2. Every person who wilfully opens, tears down or destroys any fence on the inclosed land of another, is guilty of a misdemeanor.

Giving Permiaelon to Hunt.

Sec. 3. Every person who wilfully enters upon tho inclosed land of another for the purpose of hunting, or who discharges fire-arms, or lights camp fires thereon, without first having ohtained permission of the owner or occupant of said land, is guilty of a misdemeanor.

Killing or Wounding Horeas, Cows, Etc.

Sec. 4. Every person who wilfully, carelessly or negligently, while hunting or camping upon the inclosed lands of another, kills, maims, or wonnds an animal, the property of another, is guilty of a misdemeanor.

Camp Firee.

Sec. 5. Every person who, upon departing from camp, wilfnlly leaves the fire or fires hurning or unextinguished, is guilty of a misdemeanor.

Penaltiae.

Sec. 6. Every person found guilty of any of the misdemeanors herein mentioned, shall he fined not less than $20 nor more than $50, and shall he imprisoned in the county jail until such fine be satisfied, not exceeding one day for every $2 thereof.

Sec. 7. All acts and parts of acts in conflict herewith are repealed; *provided*, however, nothing herein contained shall be constructed as repesling section 594 of the Penal Code.

Recording Mining Claims.

The law of Congress requires no record of a mining claim except in ohedience to valid local rules or customs of miners; hut when such local rules or customs require a record, it must contain the names of the locators, the date of the location, and such a description of the claim by reference to some natural object or permanent monument as will identify the claim; hut such natural objects or permanent monuments are not reqnired to he on the ground located, although they may be; and the natural object may consist of any fixed natnral object; and such permanent monnment may consist of a prominent post or stake firmly planted in the ground, or of a shaft snuk in the ground. If, hy reference to any such natural object or permanent monument the claim can he identified with reasonable certainty, the record will he sufficient in this particular; otherwise, not.

The object of recording mining claims is to give notice to others desiring to locate in the vicinity. The language of the Act of Congress authorizing miners to make regulations "governing the location and manner of recording," implies that the act of location is distinct from that of recording, except where the regulations of miners mske recording necessary to constitute a location; so that a location may he complete, and vest the exclusive right of possession hefore any record thereof is made, nnless recording is made an act of location, or one of the acts necessary to constitute a location, hy miners' rnles or regnlations.

The right to a mining claim will not be forfeited hy a failure to record the same, in the absence of miners' rule or regulation providing for a forfeiture on that ground.

In the absence of any miners' rule or regulation making recording a necessary act or condition of a complete location, or providing for a forfeiture hy failure to record, a prior location of a mining claim, without recording the same, gives the locator thereof the exclusive right to possess and enjoy the same as against all persons having actual notice of such location and extent thereof.

EL DORADO.—The ditches of the Cal. W. & M. Co. are heing well snpplied with water from Loon lake. Ready sale is found for it all. Mr. Sydney De Kay, of New York city, in hehalf of himself and other stockholders, who has just spent several days in examining their property here, declares himself highly pleased with the property and the permanent improvements which are heing msde upon it under the management of Mr. Findley. We understand that the company propose to continne the work of extending their large granite dams at Loon lake until the close of another season, when it is estimated a storage four times the present capacity will have been secured. Once this is accomplished, the main ditches will he enlarged, the rates of water reduced, and a new incentive given the indnstrial welfare of this divide. Those massive structures of granite will he eternal as the hills. All who visit the works are surprised at their huge dimensions, and are enthusiastic in their praise of them. All we have said concerning this fino property is snhstantiated by all who have come from the East to inspect it, and the numher has not heen few. We have a few croakers and growlers in this vicinity, who entertain a hobhy that this property should he conductsd as it was under the old management, hut their numbers are hecoming insignificant as time unfolds to our people a hetter realization of the deep and commendable plans of improvements engaged in hy the managing director, Mr. Thos. Findley. A great enterprise like this, which is intendsd to huild up this side of El Dorado, cannot he matured in a single season.—*Georgetown Gazette.*

A MINING STAMPEDE.—A correspondent of the Nez Perce (Idaho) *News*, writing from Narrows, says: Within a few days considerable excitement has sprung up here, in consequence of reported discoveries of rich mining gravel on Big creek. However, nothing definite is known. In June last a man came here from Walla Walla, on his way thither, hut the streams were then high, and he went to Boise. He told stories of a hrother and others having wintered and washed on lower Big creek, and of $800 in dust having heen taken from there and sold in Walla Walla. Little credence was placed in his tales. Last Friday, however, a party of 33 men from Boise passed through Floyd's place, known as "Tailholt," 25 miles north of here, going to Big creek. They followed Col. Bernard's trail from the lower end of Long valley across to the head of the south fork of Salmon, then down that stream to the mouth of Secesh, then across the mountain to the head of Big creek. They were well equipped with arms, hlacksmith tools, whip-saws, etc., and apparently meant business. A party from here will leave for the same place in a few days, taking a northerly range.

DEFINITION OF VEIN OR LODE.—A vein or lode authorized to he located is a seam or fissure in the earth's crnst filled with quartz, or some other kind of rock in place carrying gold, silver or other valuable mineral deposits named in the statute. It may he very thin, or many feet thick, or irregular in thickness, and it may he rich or poor, provided it contains any of the metals named in the statute. Bnt it must be more than detached pieces of quartz or mere bunches of quartz not in place.

Soap-Making Without Boiling.

At the recent woolen exhibition at the Crystal Palace, in London, a novel process of soap-making was also shown, in which that article was produced in the presence of the visitors, without any fire or heating process whatever. Many of our readers, and especially wool growers, will doubtless read with interest the following description of the process as given in the *British Trade Journal*:— It appears that the Greenback Alkali Company, of St. Helens, have put up a small soap-making establishment, and are actually making on the spot with pure caustic potash all the soap required by the wool-scouring machines in full operation. The process is simply a mixing one. Pure caustic potash, or double-refined powdered caustic soda (dissolved in water so as to make a strong lye), is stirred in proper proportions into oil or melted tallow, producing a wool-scouring soap or a hard soda soap, according to whether caustic potash or 98% caustic soda is used for saponification. The whole establishment occupies only a few square feet, and yet the operator in charge tells us that, with only a small pan for melting the tallow, and a few vessels for holding the dissolved alkali, he could, if required, make one or two tons of soap in a day with the simple appliances before him. The soap made for the wool-washing machines is a simple tallow soap, made with pure caustic potash. The condition of the wool as coming from the machines after washing seems most excellent in color and handle, and yet without any signs of severe scouring.

This process appears worth the attention of many of our readers. Tallow at a sheep farm is certainly cheap and easily obtained; this seems to be four-fifths of the cost of this soap. It would appear, therefore, that to make this potash soap on the spot, and scour the wool immediately after shearing, would be a profitable transaction to the wool grower. Not only would the value be enhanced, but the saving in carriage and freight home on the grease (consisting of some 30% of the entire weight of the wool) would be very considerable.

Dividends vs. Assessments.

The statistician of the *Bulletin*, says the San Francisco *Stock Exchange*, furnishes some interesting figures concerning Comstock assessments during the four years ending May 1st of this year. According to this authority, in the period named there were 314 assessments levied on Comstock mines, aggregating the rather considerable sum of $27,712,910; but as an offset to this, there were $6,000,000 in dividends in excess of the aggregate of assessments, which were as follows:

Dividends, California mine	$17,360,000
Dividends, Con. Virginia mine	15,930,000
Dividends, Ophir mine	201,600
Dividends, four years	$33,491,600
Assessments, 27 mines, four years	27,712,910
Excess of dividends	$ 5,778,690

There is food for reflection in this. As the *Bulletin* remarks, had these 27 mines been worked in the interest of one men for ths past four years, fortune's wheel would still have shown a handsome surplus to risk in futnre developments. In other words, on an investment of $27,712,219 an individual would have made $5,778,690 clear profit during the four years. But it is impossible to make our Eastern friends see the force of this. They cling to the idea that it does not, or ought not, to cost anything to either search for ore bodies or reduce them into gold and silver when found. Most of them have a vague idea that a mine should be a kind of a Monte Cristo cave, where all that is needed is to shovel the wealth into sacks and pay it ont in dividends. Let them look at it in any way they choose, the Comstock balance sheet is still in favor of the stockholder.

Woman, the Queen of Home.

There is probably not an unperverted man or woman living, who does not feel that the sweetest consolations and the best rewards of life are found in the loves and delights of home. There are very few who do not feel themselves indebted to the influences that clustered around their cradles for whatever good there may be in their characters and condition. Home, based upon Christian marriage, is so evident an institution of God, that a man must become profane before he can deny it. Wherever it is pure and true to the Christian idea, there lives an institution conservative of all the noblest instincts of society.

Of this realm woman is the queen. It takes the cue and hue from her. If she is in the best sense womanly—if she is true and tender, loving and heroic, patient and self-devoted—she consciously and unconsciously organizes and puts in operation a set of influences that do more to mould the destiny of the nation than any man uncrowned by power of eloquence, can possibly effect.

The men of the nation are what mothers make them, as a rule; and the voice that those men speak in the expression of power, is the voice of the woman who bore and bred them. There can be no substitute for this. There is no other possible way in which the women of the nation can organize their influence and power that will tell so beneficially upon society and State.—*Scribner.*

Useful Information.

Interesting Statistics.

The production of agricultural implements in this country gave employment in 1850 to 5,361 hands; in 1860, to 12,867; and in 1870, to 23,251. Now the number of hands engaged in this industry is 40,680. Maine now has 282; New Hampshire, 245; Vermont, 495; Massachusetts, 646; Rhode Island, 108; Connecticut, 790; New York, 7,237; Pennsylvania, 3,097; Delaware, 71; Ohio, 10,218; Michigan, 1,978; Indiana, 2,526; Illinois, 7,870; Wisconsin, 2,700; Minnesota, 330; Iowa, 1,104; Missouri, 1,074; Kansas, 261; Nebraska, 81. Ohio has made notable advancement in this industry. In 1860 she had 165 persons employed in it and to-day has 10,248.

Alabama is as large as England, and yet has only 1,000,000 of people to England's 21,000,000. California, with less than 1,000,000 of people, is very little smaller than France with 36,000,000. We do not think Massachusetts overcrowded with 1,500,000, nor Ohio with less than 3,000,000, nor New York with 4,500,000; and yet, if Texas were settled as thickly as New York, its 1,000,000 would grow to 22,000,000; if like Ohio, it would have 21,000,000; if like Massachusetts, it would hold 52,000,000, or more than the whole present population of the Union. There are only 15 States out of the 38 which have each more than 1,000,000 of people, while there are 11 States which have a larger area than England with her 21,000,000. Settled like England, these States would have more than 300,000,000. The States toward which emigration is now mainly setting are Minnesota, Nebraska, Kansas, Texas and Colorado. These about equal Missouri in population, while their area is ten times hers. So, to be evenly populated like Missouri, sparsely populated as that State is, these five should have 29,000,000; and to be settled like Massachusetts, being ninety times as large, they must have 135,000,000, or three times our country's present population. If the whole territory of the Union was settled like New York, it would contain 270,000,000; if like Massachusetts, 560,000,000; and if it reached England's ratio of inhabitants to the square mile, its population would almost equal the present population of the globe.—*Exchange.*

Discovery and Uses of Water-Glass.

Von Helmont, in 1640, found that when, in making glass from sand and alkali, an excess of alkali was used, the glass would dissolve in boiling water. In 1827, Von Fuchs utilized water-glass, soluble glass or silicate of soda, in stereochromy or solid color-painting, in monumental and mural decoration, and in the preparation of cements and artificial stones. London *Engineer* suggests that, although used for a large number of purposes in the arts, it is capable of more extended application when it becomes better known. A compact, marble-like stone is formed when it is mixed with chalk and is dried. Similar stones are formed by mixing water glass with bone-ash, zinc-white and magnesia. Ransome's artificial stone is prepared by mixing sand with water-glass solution, to form a plastic mass which is then pressed into the required shapes and placed in a solution of calcium chloride: the silicate of calcium thus formed cements the grains together, and the chloride of sodium formed at the same time is removed by washing with water. With clay, lime, sand, cement, etc., soluble glass enters largely into the composition of many of the patented artificial stones, plastic tiles, slates, etc., and also of our common soaps, the detergent qualities of the glass making it an excellent scouring material. In cold water this glass is nearly insoluble, or dissolves very slowly, but in boiling water it dissolves with facility; and remains in solution after the water has cooled. If the water contains 30% of the glass in solution, we have a substance of a sirupy consistence, which may be used as a transparent varnish on many substances; on drying, it forms a glassy coating that fairly resists moisture and change of temperature. *Engineer* remarks that, although the *Scientific American* says it has been used extensively as a vehicle for certain pigments to form paints known as silica paints, oil and the other common ingredients are used as the vehicle in the paints known and largely used by that name in England.

Leatherette—Its Manufacture and Uses.

One of the many articles made of paper material, which is gradually coming into general use, says the *Paper World*, and for which something else gets the popular credit, is leatherette, which is manufactured by the Shawmut Manufacturing Company of Boston, at Turner Falls, Mass.

It is being brought into use in so many ways, and is at once so susceptible of beauty and economy in various mechanical and ornamental appliances, that we may well give something more than a passing notice of it. It is so perfect an imitation of leather that its use is time and again had, without its users being aware that they are handling something other than leather itself, and its serviceable nature renders the detection still more difficult. For all uses to which it has yet been applied it is nearly, if not quite, equally serviceable with leather, and gives excellent satisfaction to those who have occasion to use it or to deal in it.

It is only in this country that leatherette, the real, genuine article, is made. The Japanese are the only people who manufacture an article to be at all compared to our American leatherette, and although they make an excellent imitation, the price of their material is high and they copy but few grains and colors, while our leatherettes can be made to imitate any grain of leather, and in any conceivable color, so much so that it has rapidly grown into popular use in a great diversity of purposes, among which are book and pamphlet binding, silver, jewelry and all kinds of leather cases; fancy boxes for papeteries, pocket-books, trunk linings, boot facings, table and desk coverings, wall paper, letter-files, chess-boards, etc., and its durability has been proved by its use for covering whip handles.

As its name implies, it is a close representation of leather, so close that good judges are often deceived, and requires a thorough examination to detect its true nature, and when used in the different trades it answers the purpose to which it is put equally well with the real article. Being made of paper, it enters only into competition with leather when it can be fastened to some more solid substance than itself, as, for instance, cloth for belts, wood for boxes, leather for inner sole linings, or pasteboard for book binding, although for flexible covers it answers without any support. Its surface wear is remarkably durable, as it is made on the same principle as oil-cloth. Numerous imitations have been on the market for several years, but no exact imitation of leather has ever before been accomplished. The genuine leatherette, though unknown, even in name, only a few years ago, has now become an established article of trade, and taken a notable place among our American industries.

Coffee Syrup.—Take half a pound of the best ground coffee, put it into a saucepan containing three pints of water, and boil it down to one pint; boil the liquor, put it into another saucepan, well scoured, and boil it again. As it boils add white sugar enough to give it the consistency of syrup; take it from the fire, and when it is cool, put into a bottle and seal. When traveling, if you wish for a cup of good coffee, put two teaspoons of the syrup in an ordinary cup and pour boiling water upon it, and it is ready for use.—*Caterer.*

Stain for Brown Oak.—Mix together two ounces of pearlash and two ounces of American potash in a quart of warm water, and apply to the parts to be stained; a very little red sanders in your polish improves this stain. Some polishers use bichromate of potash, weak, for this stain, but I prefer the former. Always stain before oiling your work, and the stain strikes deeper into the wood.

Good Health.

Laws for Hair.

The general law for the care of the heir is cleanliness. But this essential condition is not always to be brought about by the same methods. In some cases the scalp and the hair itself require washing as often as once every month; in other instances, once in three months is sufficient. When the hair is in a healthful condition the glands at the roots are strong and vigorous and supply a natural oil. These glands often become obstructed or weak in their action, and finally dead. So long as they are inactive through obstruction or weakness, the hair may be restored, but when they are actually dead, and the scalp assumes a shining appearance, nothing will remedy it. Baldness may be prevented; it cannot be cured.

The obstructions are to be removed first by thoroughly washing or shampooing the head. This is to be done by using water and castile soap as warm as it can comfortably be applied. It must then be thoroughly rinsed. Three or four rinsings with tepid water are not too much. After this cleaning the hair for a day or two is apt to be harsh and dry. Special attention should then be given to rubbing and brushing the scalp. One of the most effectual methods to keep the glands in good working order and to bring out the oil, is to rub the head gently (either night or morning, when you have the most time to devote to its care) with the balls of the fingers. In this way the hair is not only separated, and the air allowed to pass through it, thus drying it from an unpleasant moisture, but the pressure upon the secretions of oil causes activity and brings it to the surface.

The hair should be thoroughly brushed every night or morning with a brush of good stiff English bristles. Wire brushes irritate the scalp and are very detrimental. For the same reason fine-tooth combs should not be used. It should always be remembered that while friction is necessary, irritation is to be avoided. Excessive irritation will itself produce dandruff, the most common of the scalp diseases, and often the forerunner of those of more serious nature. In cases where the dandruff is excessive, and of a dry, scaly nature, the scalp should often be washed, and always carefully. But even in such instances the hair itself requires occasional washings to cleanse it from dust. In such instances it is necessary to apply some safe and reliable wash, which should be free from oil. After the dandruff is removed, proper care and attention will promote luxuriant growth, and where there is not actual baldness, will restore natural vigor.

In order to keep the hair healthy it is essential that it should be trimmed about once a month. Merely chopping off the ends does not answer this purpose. The hair should be examined under a microscope and every end that is split—all hair splits after a time—should be trimmed off. These split ends are dead hair, and no matter how scanty the hair is the sooner one is rid of this much of it the better. The first time it is trimmed in this way, from a quarter to half an inch should be removed: after that only the extreme ends need be cut.

In regard to dressing the hair, the crown of the head should be kept free. The practice of parting it at the sides, just above the ears, and pulling it toward the top, is very injurious, making the crown soft and tender and the hair diseased. Crimping the hair may be done without much injury if great care is used. Instead of braiding in 10 or 12 small, tight braids, there should be but two. The buttons at the back of children's dresses, or sprons, often ruins the hair by snarling and breaking it, and luxuriant curls or flowing tresses have sometimes to be shorn close just for this reason. The prevailing notion is that children's hair should always be cut. But, if the child is perfectly healthful and the hair good, it is only necessary that the ends should be carefully trimmed every month. For delicate children, the hair should be kept cut close till they are 12 or 14 years of age. The most sensible and healthful style for girls for school and ordinary wear is to braid it firmly and leave it hanging down the back.—*Food and Health.*

Why We Commence Dinner with Soup.—The rationale of the initial soup has often been discussed. Some regard it as calculated to diminish digestive power on the theory that so much fluid taken at first dilutes the gastric juices. But there appears to be no foundation for this belief. A clear soup disappears almost immediately after entering the stomach, and in no way interferes with the gastric juice, which is stored in its appropriate cells ready for action. The habit of commencing dinner with soup has, without doubt, its origin in the fact that aliment in this fluid form—in fact, ready digested—soon enters the blood and rapidly refreshes the hungry man, who, after a considerable fast and much activity, sits down with a sense of exhaustion to commence his principal meal. In two or three minutes after he has taken a plate of good warm soup the feeling of exhaustion disappears, and irritability gives way to the gradual rising sense of good fellowship with the circle. Some persons have the custom of allaying exhaustion with a glass of sherry before food—a gastronomic no less than a physiological blunder, injuring the stomach and depraving the palate. The soup introduces at once into the system a small installment of ready digested food, and saves the short period of time which must be spent by the stomach in deriving some nutriment from solid aliment, as well as indirectly strengthening the organ of digestion itself for its forthcoming duties.

Know Thyself.—Horace Mann justly remarked—"A spendthrift of health is one of the most reprehensible of spendthrifts. I am certain I could have performed twice the labor, both better and with greater ease to myself, had I known as much of the laws of health at 20 as I do now. In college I was taught all about the motions of the planets as carefully as if they would have been in danger of getting off the track if I had not known how to trace their orbits; but about my own organization, and the conditions indispensable to the healthful functions of my own body, I was left in profoundest ignorance. Nothing could be more preposterous. I ought to have begun at home, and taken the stars when it should come their turn. The consequence was, I just broke down at the commencement of my second college year, and have never had a well day since. Whatever labor I have been able to do has been done only on credit, not on capital—a most ruinous way, either in regard to health or money. For the last 25 years I have been put from day to day on my good behavior, and during the whole of this period, as an Hibernian would say: 'If I had lived as other people do for a month, I should have died in a fortnight.'"

In spite of the magnificence of the domestic arrangements of the ancient and refined care bestowed upon all that could make life agreeable, they were without many of the most ordinary conveniencies. For instance a clock to regulate time, to us an indispensable piece of furniture, which a man of the most moderate means can command, and even the poorest does not like to be without, was for nearly 500 years unknown in Rome, and even in latter times only in a very imperfect state. According to Pliny there was no sun-dial in Rome until 11 years before the war with Pyrrhus, although in Greece they were in use somewhat earlier, about 500 B. C. Water clocks came into fashion later on; but there was no idea of accurate time keeping, and in order to know the hour, without giving themselves any trouble, the patricians kept slaves for the express purpose of watching the dials and reporting each time the hour expired.

Last Monday, says the *Foothill Tidings*, the builders completed a new quartz mill at Timbuctoo, in Yuba county. The mill will be used for the reduction of ore from the Marc Antony mine. The mill and mine are owned by Mr. M. T. Brewer, of Sacramento, and Mr. R. G. Hart, of Grass Valley.

London.—The population of London nearly equals New York, Philadelphia, St. Louis, Chicago, and Boston combined.

Passing Events.

As we write, Thursday, the first indications of the approach of winter are at hand. The wind is south and the rain falling. This first rain of the season is much earlier than usual, and it will be somewhat strange should we have more before the middle of October.

The death of the President is naturally the all-absorbing topic of the week. On Tuesday, the banks and exchanges were closed, and they will close on Monday, the day fixed for the obsequies, in accordance with the recommendation of the Governor in his proclamation, which we print in another column. Thus business is interrupted and the minds of all turn to the sad themes of the assassination, the lingering illness and the death. Sorrow is widespread and genuine. Rancor, partisanship, sectional feeling, in short, all narrow thoughts have been laid aside, and for the last two months the popular atmosphere has been purer and clearer than usual. The nation has apparently been living a higher life, and the suffering of the President, though grievous to be borne, has not wholly been in vain. It is to be hoped that the influence of the event will linger long in the hearts of the people.

The new President is in his office. Chester A. Arthur, chosen Vice-President, took the presidential oath at the hands of the Supreme Court judges in New York city, early on Tuesday morning, and entered at once upon the discharge of his duties.

Our "Mining Summary" will give all the news there is from the mining regions. Means are being taken to relieve the heat in several of the Comstock mines. Up at Enreka a strike in the tunnel encourages them all, and we hear of new placere being found in Montana.

Complex Auriferous Ores.

A new process, the invention of Messrs. Molloy and Warren, for treating complex (or rebellions) auriferous ores, is attracting some attention in England, and considerable space is devoted to consideration of it in some of the technical journals. As far as we can understand it without an opportunity of reading the specifications the object of the process is the extraction of gold and silver from ores which are of a refractory character, such as tellurides, pyrites, arsenical pyrites, etc., and which can be only partially treated by the ordinary methods. By ordinary analysis by the wet process (*i. e.*, dissolving out with nitro-hydrochloric acid) it is known that all the gold and silver can be extracted from any refractory ore. If, therefore, such ores could be treated in quantity by the same means, then it is evident that all the gold and silver would be got out. It is this the process is intended to accomplish, and the possibility of doing so is said to have been demonstrated at the works in Liverpool. As to cost, it is claimed that the expensive solvent—nitric acid—can be used over and over again with only a fractional loss, the inventore claiming to have discovered a method by which this can be done.

The process is thus described: It consists in first crushing the ore, which is done by the aid of the Beaumont direct-actuag steam stamp, which is similar in principle to the steam hammer. It is double acting, with a six-inch cylinder and an 18-inch stroke. It has a steam driven valve, by means of which the blow is accommodated to the thickness of the layer of ore under the stamp-head. The ore is then concentrated and roasted in a small reverberatory furnace. When roasted the ore is placed in a stone-ware tank, heated by steam, and there subjected to the nitrohydrochloric solvent and treated. All the gold and silver is then dissolved out, and the solution, when charged, drained off into a second tank and allowed to settle. The clear solution is then tapped into the precipitating tank, in which by means of sulphurous acid the gold is precipitated as a fine powder, which has then only to be put into an ordinary crucible and melted into gold bar. The silver, if any, is obtained by washing the residual ore, precipitating the results, and treating it in the same way as the gold, and is obtained in a bar with equal facility.

San Bernardino Mines, Etc.

Mr. Ed. Lawson, of San Bernardino, formerly a printer in this office, recently called in, and on inquiry gave us the pleasing information that business prospects in his town continue very promising. The agricultural outlook is remarkably good. Several mining districts, relying upon the town as a base of supplies, are assuming greater importance. The new mines on the Mohave desert are developing wonderfully. R. M. Waterman's mine is supposed to have been one of the wonderful discoveries reported by the "old man Lee" on the desert. A few tons of the ore shipped to San Francisco are said to have produced sufficient bullion to place a mill on the ledge. Mr. Waterman promptly refused an offer from leading San Francisco capitalists of $550,000 for his principal mine. Mr. Waterman considers there are "millions in it." We personally know Mr. Porter, who is associated with Mr. Waterman, to be an experienced mill man, and are much gratified to learn of his and Mr. Watsrman's success. The "King mine," in the same neighborhood as Waterman's (70 miles from San Bernardino), has recently been bonded by Sheriff King for $300,000. The rock is said to assay from $400 to $2,000 per ton. The Hartman, and other mines, are also accounted extraordinarily good.

Mr. Lawson's firm (Lawson Bros.), it is a pleasure for us to state, are doing well in the news, stationery and variety business, and hold a good standing in the community in which they have long been favorably known — facts the writer learned with gratification during a brief visit in San Bernardino.

Gov. TABOR, of Colorado, says the New Mexican *Mining News* of Sept. 14th, has struck it rich again. Last Friday, a mine which he was having developed under bond opened into a true fissure—a vein 40 ft. wide, with 6 ft. of pay streak, the latter running 600 ounces to the ton, the second and third grades running 300 and 100 ounces respectively. The Governor bought his bargain of a couple of Maine Yankees who sold him a mine for $100,000 worth many millions.

THE Washington *Herald* says: Gold and silver mining stock companies are becoming an institution peculiar to the enterprising capitalists and business men of Washington. Several companies for the development of the rich gold and silver mines of Arizona and New Mexico Territories have been organized in Washington within the present year.

The Nation's Loss.

The President is dead. For 80 days the country watched with longing eyes for every indication that his precious life would triumph over the wretched stroke of the assassin and has balanced hope and fear with almost affectionate anxiety. Meantime with heroic fortitude he has borne indescribable pain, and with brave heart awaited the result, longing to live and yet not afraid to die. And now he has gone hence, leaving to the country a rich legacy in the memory of a noble life and the example of high and disinterested patriotism. To-day the people mourn. The emblems of mourning are fixed upon a nation's homes and marts, along the country roads and beside the city streets. Everywhere hearts are heavy with the sense of the nation's bereavement.

James Abram Garfield was born on November 19, 1831, in the district known as the Western Reserve, about 15 miles from Cleveland, Ohio. His father, Abram Garfield, was a hard-working farmer, but the rough pioneer labor exhausted him before his prime. The mother was a woman of large frame and strong common sense. Of four children James was the only one who betrayed uncommon capacity. The elder brother is now a farmer in Michigan and the two sisters

THE LATE JAMES A. GARFIELD.

farmers' wives. In James, to the father's passion for work was added the mother's desire for knowledge. He worked early and late, but all his efforts were put forth to get an education. Labor on the farm through the summer, work at the carpenter's bench during the winter filled up his time, but, unlike his companions, he was never satisfied with this life. He had a strong desire to go to sea, and he walked 40 miles to Cleveland to ship on one of the lake craft. The captain swore at him and he retired discomfited, but compromised his nautical longings by hiring out as a canal boy. He drove the horses, and after a season of this apprenticeship was allowed to take charge of the helm of the boat. In the winter he turned his hand to any rough farm work. But even this active life could not satisfy him. He felt the stirrings of ambition—he had a consuming desire for knowledge. With a small amount of money which he got from his mother he set out for the nearest school. Here he studied hard, supporting himself by work at the carpenter's bench at morning and evening, and teaching school during the winter months. At 23 he concluded that he had gained everything possible from the academy. He had saved up money enough to carry him through one year at college. So, with that energy which always characterized him, he insured his life, made over the policy to a business man for a loan of ready money, and thus equipped, started for Williams College. In 1856, Garfield was graduated from college, receiving one of the best honors. On his return home he accepted the position of professor at the College of the Disciples, in Hiram, Portage county, Ohio. After two years of this work he was elected President of Hiram college. While a professor, he married Miss Lucretia Randolph, the daughter of a farmer in the vicinity, whose acquaintance he had made while preparing for college. They married because they loved each other. Neither had money, but the young girl sympathized with Garfield's tastes and aspirations; she encouraged his ambition and stimulated him to study and reading by her own scholarly tastes. In subsequent years he has acknowledged that no small share of his success in life has been due to her unwavering faith in him, and the encouragement which came from her intelligent companionship and womanly devotion.

The young college President was elected in 1859 to the State Senate of Ohio from the counties of Portage and Summit. The summer of 1861 saw him a Colonel, in command of the Forty-second Ohio Infantry — a regiment largely composed of his friends and of the students of the college. His army record is full of honors for honorable service, and he rose to the rank of Major-General. While in the field, Garfield was nominated for Congress and elected by a large majority, in December, 1863. He showed at once that, though unpracticed in parliamentary tactics, he was no mean antagonist in debate. Before the first session was over he had won an assured place in the regard of his associates, and had made his mark as a ready debater. He showed in his first session a great fondness for the study of financial questions, and when appointed later on the Ways and Means Committee, he did good service in enforcing his idea of specie payment. He never wavered in his convictions, nor faltered in defense of what he regarded as the only safe financial policy of the government. In January, 1880, he was elected to the seat in the Senate which was then occupied by Allan G. Thurman, whose term expired March 4, 1881. After Garfield's nomination for President by the Chicago Convention on June 8th of last year, he resigned his seat in the Senate to which he had been called, but which he never occupied. He was elected President by a decided majority, and inaugurated March 4, 1881.

The events of the last summer are too fresh in the minds of the people to need rehearsal. None can forget the darkness of that Saturday, July 2d, when the news was spread abroad that the President had fallen at the hand of a miscreant; none can forget the long days of suspense from that time until the patient sufferer was released.

Tributes to the worth of the dead President will occupy the tongues and pens of orator, poet and historian for a long time to come. Just at the moment, it is difficult to frame fitting praise, but the following from the New York *Tribune* is excellent:

At the very moment when he was stricken to the earth he was considered among the most acceptable of all the rulers of the nation. His ability, his statesmanship, and his personal purity of character, were recognized by all. He was esteemed as an example to all who claimed a share in the honor that such a ruler bestowed upon his country, and would also share in the brilliant prospects of his administration. He stood confessed as one of the foremost men of the age. The great chieftain, and what is more, the Executive of a great people, has been stricken down in the moment of his fame. Long will he be lamented. Long will the atrocity of his fate be cited in future times. Generations yet to follow will forever link the name of Garfield among the brightest and most glorious of the rulers of the American people. By the side of the name of Abraham Lincoln the American people have now reverently inscribed James Abram Garfield. These two great names will live forever in history. As they mourned Lincoln, they will mourn Garfield, with a feeling of reverential tenderness, with gratitude for the example of his lofty, pure life, and with pity for his cruel, untimely death.

It is fitting as we mourn for the dead, that we should express sympathy with those whose personal loss is greater than ours can be—the honored mother, heroic wife and beloved children. The President loved his family with a love which is a shining example for a nation of sons, husbands and fathers. As a contemporary writer says: He died as a pure, upright Christian would prefer to die, with an unblemished record, wholly unmindful of personal pain and the abrupt termination of his highest political hopes, and grieving only for his cherished wife and children, whose love and affection made his home an earthly heaven. Around his bedside the American people have for weeks gathered in sympathy and prayer. To-day the same people will mingle their tears with those of his venerable mother, his wife and children, as members of one common family, mourning one common father and friend.

Holding of Placer Mines.

The United States laws relative to the location and possession of quartz mines or mineral-bearing veins of any kind are definite. The claimant must define his claim on the ground, post and have recorded a notice of location, stating what is claimed and for what purpose and to remain in possession prior to obtaining title by United States patent, must do yearly $100 worth of work on the claim.

In the case of the placer mines, the laws of location require equal definiteness in defining the claim on the ground and in posting and recording a notice of location. There is, however, absence of any direct specific law requiring work to be done on placer claims to hold possession. As a consequence, large areas of valuable placer mining ground are held by speculators on paper titles. Only a notice of location; no work, or very little, being done. Most, if not all of these claims are held by men who have, nor ever will, expend a single dollar on their exploration or development, nor will they permit others to do so. If one of these claims is relocated with the intention of working the same, the first claimant with his paper title, steps in and threatens litigation. This state of affairs unquestionably operates to the disadvantage of legitimate placer mining. The laws regulating quartz mining work well, and Congress should enact laws placing mining on as near as possible the same footing.

A SALT LAKE man has signified his intention of putting up six sawmills in Montana next spring. He thinks the demand for lumber will justify it.

Lead Bath for Ores.

The following paragraph, which originally appeared in the letter of the New York correspondent of the San Francisco *Bulletin*, is now going the rounds of the press:

"It may be interesting to your readers to know that a company has just been organized for the working of a new ore extracting process, by which it is claimed that ore worth $5 a ton can be profitably treated. The company is now at work putting up works in New York here, and expect to begin operations very soon upon some tailings from the Comstock mines. The process is as yet a secret. I understand, however, that melted lead has something to do with it, and that it is wonderfully cheap and effective compared to all known methods of ore-extracting. The properties of molted lead in its action toward gold and silver are extremely curious. Not every one knows, for instance, that if a bar of solid gold as big as a man's finger is plunged into a bath of melted lead it will melt instantly—so quickly that it cannot be withdrawn. Yet the melting point of lead is about 600° and that of gold 2,518°. Another curious fact is that if into a bath containing a ton of melted lead a $20 gold piece, or any other bit of gold is thrown, and the whole mass is congealed as fast as it can be done, the gold will be found equally distributed. A sample cut from the outside of the mass will assay the same as one cut from the heart of it. It was the knowledge of these facts that led miners to pulverize ore and plunge it into melted lead. But the pulverizing is a long job, and profitable only when the ore is rich. The new process is said to be perfect, and the talk about it excites no little interest among investors of mines."

There is much bosh in the paragraph given, but its worst effect is in inducing people to believe that a new process for profitably working low-grade ores by means of melted lead, has been devised. In the first place, processes for working ores by means of melted lead are as old as the hills. In the second place, dozens of them have been tried, and failed in point of economy and convenience. Quicksilver is way ahead of lead, requiring no fire to keep it fluid, more easily kept clean, and handier in every respect.

Every now and then, however, some genius comes to the front, who is going to revolutionize things by using molten lead, and every time he does it he fails. It has been tried here a dozen times. Only last summer some thousands of dollars were sunk in a metallurgical experiment of this kind in this city, and the people who invested in the thing thought the whole idea was new. The writer warned them at the time of the inoperativeness of the system, but they thought the lead would absorb gold and silver from the ore and the sulphurets, and save concentration and chlorination. It also absorbed several $20 pieces of the investors, and, as the correspondent above asserts, these "twenties" were well distributed. So well that they never got them back. The appliances are now here and may doubtless be procured cheap.

To prove that this is not at all a new idea, it is only necessary to look back a little. As long ago as 1829, John Henry Vivian, R. S., published in the "Record of Mining," a paper on "The Smelting of Silver Ores" as then practiced on the continent of Europe, and in that he described in great detail the various means of smelting auriferous silver ores for matte and extraction of the precious metal by a bath of melted lead, and at that time they had been in vogue several years. John Arthur Phillips, in his "Mining and Metallurgy of Gold and Silver," published in 1867, describes the system also, and in the chapter on the concentration of the precious metals in metallic lead, a great deal is said.

Of course we understand that in the various processes which have been adopted for the extraction of the precious metals from their ores by smelting, advantage is taken of the affinity which lead possesses for them when in a molten state, and consequently it performs when in that condition a similar service to that rendered by the mercury at lower temperatures. From the great facility with which the sulphides of silver are converted into an impalpable powder, which, by floating off on water becomes commercially lost. The mechanical concentration of silver ores is a very wasteful operation; and hence the solubility of sulphides of silver or the fused metallic sulphides are made use of as a means of concentration. The gold present in the ore is also concentrated in these metallic sulphides.

But when you come to pulverize ore and pass it unconcentrated ton after ton *continuously* through a bath of molten lead, there are many practical difficulties to overcome. It seems to us that if this New York Company is going to work Comstock tailings by this process it will have a job on its hands to make any money. It will take all they get out of each ton to keep up the fire under the lead.

From our remembrance in having looked this subject up and in the patent office reports, we call to mind a few instances which will show what has been done in the United States:

In 1866, a man named Tripp, patented a method by which the ore was delivered in a tube, and a heavy metal screw carried it under lead in a cylinder.

In the same year, the same inventor patented an upright cylinder, with revolving shaft, having spiral blades on the lower end for distributing ore at the bottom of a lead bath.

He also patented another arrangement by which the ore was conducted to and disseminated at the bottom of a lead bath by means of revolving tube, with cylindrical bottom and openings for escaping ore.

Then, in 1868, Tripp got another patent on a tube going into the bottom of the lead bath. The ore came out of the orifice into the bath. The central stationary cylinder was jacketed in an outer revolving one.

Fuller, in 1868, got up a similar arrangement and patented it.

In the same year, an inventor named Brown patented a device. He had a vessel with hollow rotary shaft with apertures at the lower end enclosing a stationary tube leading from the hopper above. Teeth were attached to the outer shaft between corresponding teeth on the inner side of the same. He had both a revolving and stationery shaft for forcing quartz into molten lead.

In 1866, Hamilton improved the Fuller patent before referred to by arranging a conical tube into a funnel-shaped hopper with a peculiarly constructed deflector at the bottom to prevent those adhering to the sides of the tube.

In 1867 a man patented a hulh-shaped vessel containing a lead bath and supported in a furnace. A tubular conductor led the ore down, and a shaft on the tube had grinding plates on the lower end.

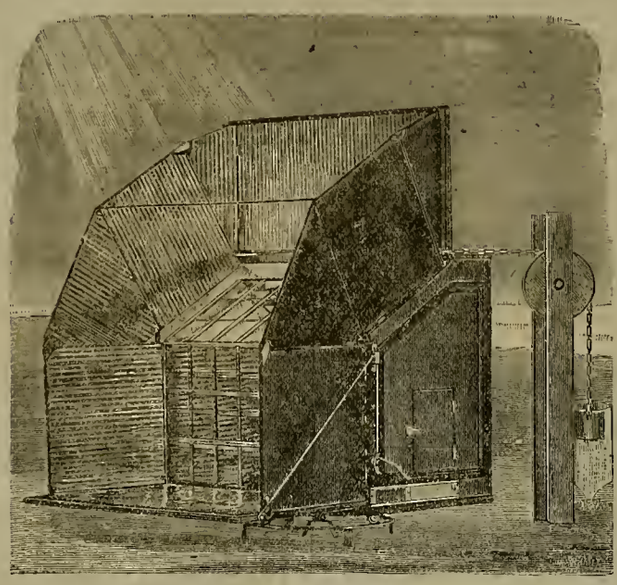
This for example will show that the idea of using lead for catching gold and silver is not new, and that it has been very fully experimented with long ago. Had any one of these processes been at all successful, it would have been in use to day. As none of these, or others, are in use where unconcentrated ore is passed through a lead bath, it is natural to presume that the process was not a practical one from an economical point of view.

Solar Heat Fruit Drier.

The engraving on this page shows a new and interesting arrangement for fruit and vegetable drying by solar heat. The principle is to concentrate the sun heat by means of reflectors upon the fruit which is spread upon trays in a chamber with a glass front. The manner in which this is done is quite apparent from the engraving. The fruit is introduced upon the trays through the back of the cabinet. The door shown on the side in the picture is to permit the operator to enter in case the glass should need polishing on the inside, or something of that kind.

The machine is mounted upon a center pivot, about which it rotates so as to face the sun, and thus obtain the full benefit of the sun's heat. The device for rotating is quite simple and inexpensive. A barrel is filled with sand or fine dirt. A cord coming from one corner of the machine passes over a pulley, and a weight on its opposite end rests upon the sand or dirt in the barrel. A spigot allows the sand or dirt to run out of the barrel slowly, and as fast as the level of the sand lowers, the weight descends and turns the machine. This is so simple it can be understood by anybody. It is to be used when the machine is filled with fruit and left to operate itself. In ordinary use, when someone is at work near at hand, all that is necessary to do is to move it a little toward the sun with the hand. As it rests upon a pivot and turns on friction wheels, it moves with very little force. The philosophy of the drier is set forth by the inventor as follows: Sun heat is powerful and costs nothing and is ready for use in this climate during the whole fruit season. Fuel for fire drying is expensive, and the labor of keeping up the fire considerable. Sun heat generates no smoke or gases, and cannot impart any disagreeable flavor to the fruit as is sometimes done by fire drying. The fruit is wholly inclosed in the drier and therefore cannot be attacked by egg-depositing insects and cannot breed worms. As it costs nothing to secure heat the drier can be started on any amount of fruit, however small, while with the larger driers it does not pay to fire up, unless the machine can be kept well filled with fruit. For these reasons the drier is adapted to use on either a small or large scale. It is also noted that the solar drier requires no building and can be set out in the orchard anywhere the sun strikes. At night the reflectors fold back over the face of the cabinet and thus maintain warmth and aid to keep the fruit from any influence of damp night air.

The solar drier is the invention of E. F. Ely, but the whole rights for this country have been purchased by G. B. Davis, 1619 Webster street, S. F. The machine is a brand new invention, and is just being introduced.



ELY'S PATENT SOLAR HEAT FRUIT DRIER.

A New and Favorable Field for Hydraulic Mining.

As is generally well known, most hydraulic operations throughout the more central mining counties of the State, have for some months past been stopped, and still remain suspended, by reason of restraining injunctions issued against these companies at the instance of the farmers. These proceedings have had a tendency, no doubt, to inconvenience and work serious injury to others than the parties defendant.

Besides the detriment to the mine owners themselves, and to the business community at large, there are other considerations that render the closing down of these mines just at this time, peculiarly unfortunate.

Owing to the many failures that had attended their mining ventures elsewhere, the attention of Eastern capitalists had begun to be strongly attracted towards properties of this kind, which, but for this set-back, promised soon to grow into favor with that class of investors with whom moderate profits, coupled with long and well-sustained production, are controlling elements. Deterred by this controversy between these two leading interests, but little capital has been embarked in our hydraulic mines for a year or more past.

While it may be conceded that this abstinence accords with the dictate of prudence in so far as the central mining counties are concerned, it should at the same time be remembered that a large section of country covering much of the best hydraulic deposits in California, enjoys an entire immunity from these disturbing questions that have so set the farmers and miners at variance and put an end to present operations in the older hydraulic districts of the State. This country lies along the Klamath river and its tributaries, extending, also, to some of the other streams in the group of counties that occupies the northwesterly angle of the State.

The deposits of auriferous gravel throughout that region are not only rich and extensive, but they exist under conditions so supremely good, that in no event could they have much longer escaped the notice of parties desirous of engaging in this branch of mining. And now that there is so little prospect of further sales of hydraulic grounds being effected just at present in the districts to the south or of any new enterprises being inaugurated there, until these differences between the farmers and the miners are adjusted, we take occasion to say that no better opportunities were ever presented for obtaining eligible properties and engaging in hydraulic mining than can at this time be found along the Klamath river, beginning at the mouth of Scott's river and extending thence 50 or 60 miles down stream.

It is not necessary to speak here of individual claims or particular localities, this object of this writing being to simply notify this investing public of the existence of this, but partially occupied and little appreciated field lying off in that remote corner of the State. It may be added, however, that among the favorable conditions alluded to are to be enumerated, ample fall or outlet for insuring effectual riddance of tailings, and that without the latter causing any damage to farming lands or any other interest or industry whatever; also, an abundance of water, with unexampled facilities for conveying the same in large volume and under any desired pressure to points where required for use, these ends being accomplished through a length of ditch averaging hardly more than eight or ten miles. The season of active operations in that region is apt to be long. The ditches, as a general thing, run full of water all summer, the supplying streams having their sources in the tall mountains near by, on some portions of which the snow lies all summer.

The gold-bearing gravel deposits, besides being extensive and of good grade, are entirely free from overlying volcanic or other barren matter, as well also as from imbedded pipe clay and the presence of hard cement. So little trouble has been given by unwieldy bowlders that it has not as yet been found necessary to erect a single derrick for handling them. While there occur many buried channels up there, the side rims of these "dead rivers" have in all instances proved to be so low that outlet and drainage have been effected by means of open cuts alone, no deep bed-rock tunnel having ever yet been driven in Siskiyou county, where the most of these comparatively virgin mines are situated.

As the question of damage to the farming lands, impediments to navigation or the filling up of harbors has never arisen, so is it likely to never come up there, for the good reason that there are no farming lands along the Klamath, the only outletting stream for that region, exposed to be damaged by the mining debris. As the Klamath itself is not a navigable river, discharging directly into the ocean, this waste matter from the mines, however much there may be of it, cannot interfere with the interests of commerce or shoal the waters accessible by any sailing craft whatever. From all these troublesome questions, now causing so much ill-feeling and costing so much money further south, these Klamath mines will enjoy entire and perpetual immunity.

As the owners of these properties, where they have been worked at all, have been content to outfit and operate them in a small way, they do not, as a general thing, set any very high prices upon them; good water franchises can also be secured at moderate figures: and as lumber, together with most other needed material is inexpensive, the entire cost of opening up and equipping a first-class hydraulic mine is, in that part of the State, comparatively small. In conclusion, it may be remarked that the climate along this portion of the Klamath is extremely favorable for hydraulic operations. Though so far north, the winters there are mild, the locality being not very far inland, and but little elevated above sea level.

A Hand Rock Drill.

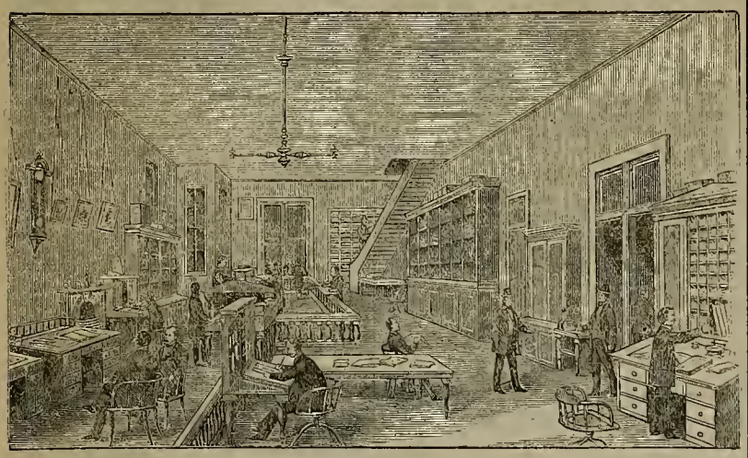
Wm. P. Stevenson, of Vallecito, Calaveras county, has invented and patented, through the Mining and Scientific Press Patent Agency, certain improvements in hand rock drills which consist in means for rapidly and forcibly striking the drill and at the same time turning it by appropriate mechanism. This is accomplished by means of arms which are drawn back by cams and forced forward by springs, these arms coming in contact forcibly with a movable head to which the drill is attached. The operating mechanism, through a cam, moves a lever in such a way as to operate a pawl which engages with a ratchet wheel upon the head which receives the drill, thereby turning it.

This device being a hand rock drill, it is adapted to be easily carried and held in proper position when at work. It is intended to be hung from the shoulders by any suitable harness or strap which will hold the end against the breast of the workman, and when being worked in convenient positions, a strap may pass from the neck to the forward end of the frame. The end being held against the breast, the drill is pressed against the rock and the cranks turned. There is one crank on each side. Came force the heater arms back against the springs in the tubes, and the springs impel them forward when relieved from the cams, so that their ends strike on the head of the rod which receives the drill, and thus drives said drill forward. At the same time, the cam wheel operates a pawl and revolves the drill. By screwing in certain screws the springs may be compressed to exert more power.

Ex-Gov. Blasdel has bought the Antelope mill situated in Dol Monte canyon about one and a half miles from Aurora. It is the intention to overhaul all the machinery and work ores from Esmeralda and Bodie districts.

It is conceded by all the miners of Park City, that Pinyon Hill, if the present suit was settled, would be the liveliest spot in Utah. They say it is full of ore from base to summit.

Interior view of Dewey & Co's Office. 202 Sansome St., S. F.



Inventors on the Pacific coast will find it greatly to their advantage to consult this old, experienced first-class Agency, which was established in 1860. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent receipt of stamp. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.
It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill, it requires twelve-horse power.

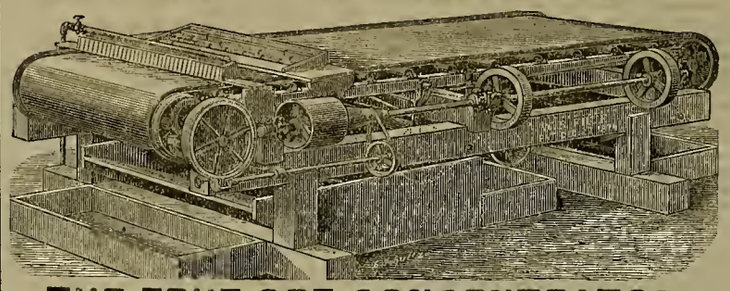
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Ohio Roasting Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill supplies. Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores. Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

$1,000 CHALLENGE!

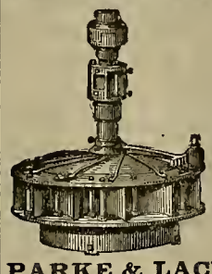


THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

LEFFEL'S IMPROVED WATER WHEEL.



PRICES REDUCED!
PATENTS REISSUED 1868.
The "OLD RELIABLE" with Improvements, making it
THE MOST PERFECT TURBINE NOW IN USE
Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new Illustrated Book sent free to those owning water power.
Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address
JAMES LEFFEL & CO., Springfield, Ohio, and 110 Liberty St., N. Y. City.

PARKE & LACY, Sole Agents, 21 and 23 Fremont St., S. F.

GIANT POWDER
MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.
Nos. ONE, TWO and THREE.
Stronger, Better and Safer than any other High Explosive
Judson Powder
IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.
It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Grades of Fuse.

New Mining Horse Power.

The demand for a better Horse Power, suited to more general use, has resulted after much experience in the above machine, which we can recommend as a First-class Hoisting Power, under complete control of man tending bucket, through levers connecting with brake and clutch.
This power is light and strong, so that two or more horses can be used for crushing ore or other work.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," U. S. and Foreign Patent Agents.

FOR THE WEEK ENDING SEPTEMBER 6, 1881.

246,747.—MACHINE FOR REFRIGERATING—C. W. Oellett, Oakland, Cal.

246,674.—OVERALLS—H. Heynemann, S. F.

246,614.—COMPOUND HYDROCARBON FUEL—J. P. Jones, Gold Hill, Nev.

246,786.—GRATE FOR STOVES AND FURNACES—Thomas Kearns, S. F.

246,682.—TRICYCLE—R. Lorenzo, Summit, Cal

9,863.—OVERALLS—D. Newstadter, S. F. (Reissue)

246,825.—COFFEE POT—Geo. A. A. Oiffait, Portland, Or.

246,826.—GASOLINE STOVES—Geo. A. A. Giffait, Portland, Oregon.

246,695.—KITCHEN TABLE—C. H. Townsend, Oakland, Cal.

246,840.—WOOD BORING MACHINE—J. M. Trackwell, Skookumchuck, W. T.

246,845.—APPARATUS FOR ILLUMINATING BUILDINGS—J. B. Whitcomb, Berkeley, Cal.

FOR THE WEEK ENDING SEPTEMBER 13, 1881.

246,925.—ORE CRUSHING STAMP MILL—C. H. Baker, S. F.

246,862.—SAFETY ATTACHMENT FOR ELEVATOR—E. B. Bisbop, S. F.

247,018.—MIDLINGS PURIFIER—Wm. Crye, Walla Walla, W. T.

247,020.—COMBINED WATER COOLER AND REFRIGERATOR—Geo. W. Deitzler, S. F.

247,021.—COOLING APPARATUS FOR AIR OR LIQUIDS—Geo. W. Deitzler, S. F.

247,022.—REFRIGERATING APPARATUS—Geo. W. Deitzler, S. F.

246,872.—AERONAUTIC APPARATUS AND REGULATOR—F. DeJough, Salem, Oregon.

247,031.—DRIER FOR PAINTS—A. H. Everett, S. F.

246,948.—SEAM AND WELT FOR UNITING LEATHER—C. F. Glanville, S. F.

247,072.—MAKING PAPER PULP FROM WOOD—R. B. Lane, Stockton, Cal.

247,080.—BOILER FURNACE—John Mailer, S. F.

246,917.—DEVICE FOR SHARPENING PLOW SHARES—D. F. Spangler, Dayton, W. T.

246,918.—TOE-CALK VISE—D. F. Spangler, Dayton, W. T.

246,919.—APPARATUS FOR PULLING TIRES FROM WHEELS—D. F. Spangler, Dayton, W. W.

246,983.—HAND ROCK DRILL—W. P. Stevenson, Vallecito, Cal.

246,990.—STEAM GENERATOR—J. S. Woolsey, Gilroy, Cal.

246,934.—TOOTH BRUSH AND CASE—Arment & Scott, Dayton, W. T.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast Inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

MAKING PAPER PULP FROM WOOD.—Rufus B. Lane, Stockton. No. 247,072. Dated Sept. 13, 1881. This invention relates to certain improvements for pulping the fiber of wood to be employed as in paper stock, or for other purposes; and it is an improvement on an apparatus previously patented by the same inventor. The present invention consists of a mechanism by which the blocks of wood to be pulped are moved backward and forward across the cutting pins, and at, or nearly at, right angles with the line of action of the cutters.

STEAM GENERATOR.—John S. Woolsey, Gilroy. Dated Sept. 13th, 1881. No. 246,990. This is an improvement in steam generators, consisting in the combination of a central pipe generator with a furnace having a contracted central grate space. By the peculiar construction, but little fuel is used, on account of the perfect combustion, and by concentrating it directly over the strong draft, the inventor obtains an intense heat upon a series of small radiating water tubes set very close together.

DRIER FOR PAINTS.—Alexander H. Everett, S. F. No. 247,031. Dated Sept. 13. This invention relates to an improved drier, to be used for paints and oils. The substance used is claimed to be far superior to other driers heretofore in use.

ORE MILL.—Charles H. Baker, S. F. No. 246,938. Dated Sept. 13, 1881. This relates to certain improvements in stamp mills by which the mill is condensed in size. This will be more fully described in another issue.

HAND ROCK DRILLS.—Wm. P. Stevenson, Vallecito. No. 246,983. Dated Sept. 13 1881. This invention is described in detail in another column of this issue of the PRESS.

A FLOURISHING mining camp will some day be located in the vicinity of the Limitar or Ladrone mountains, New Mexico. Both of these ranges, which are situated a little north of Socorro, are known to contain great quantities of low grade ore; but prospectors and miners have done but little there because ore of a higher grade could be had elsewhere. However, when locations of this kind become scarce throughout the Territory, more attention will be paid to low grade districts, which are numerous, and will eventually be found to be as valuable as those which show higher assays. Low grade ore, in abundance, is sufficient to make any camp, and of this these two ranges are known to contain a practically inexhaustible supply.

The Burial of the President.

Proclamation by the Governor.

STATE OF CALIFORNIA—EXECUTIVE DEPARTMENT: The Nation is in great sorrow. For weeks it has watched by the bedside of its dying Chief Magistrate with a unanimity and tenderness unexampled in the history of the world. But its sympathies, devotion and prayers have been unavailing. It has pleased Almighty God to remove James A. Garfield, the President of the Nation, a great and good man. One of the noblest representatives of Republican institutions has fallen. But in a Republic, the Nation survives when great men fall. The Government continues when the President dies. Our dependence is not on any one person, however great or good, but on the intelligent virtue and patriotism of the people and the blessings of God.

I, therefore, George C. Perkins, Governor of the State of California, recognizing the common sentiment of dependence on the Supreme Ruler of the universe, which has characterized the country during all this long agony of watching and waiting, do hereby appoint the day that shall be designated for the obsequies to be a day of humiliation and prayer, and I recommend all citizens of the State to suspend their usual business on that day and assemble in their respective places of worship, that they may humble themselves before Almighty God and supplicate His blessings upon the nation that this visitation may not be the beginning of a series of national calamities; that it may be overruled for good to the country; that in this hour of our great sorrow we may not forget the anguish of the bereaved wife, stricken children, and aged mother; that the new President and all the associate officers may be prepared to meet the exigencies in the changed conditions, and that the whole people, by a fresh consecration of themselves to the hands of righteousness and patriotism, may so live that the nation will have honor. God reigns, and with His blessing a true republic can never die.

In testimony whereof I have hereunto set my hand and caused the great seal of the State to be affixed at the City of Sacramento, this 20th day of September, 1880.

GEO. C. PERKINS, Governor.

Attest: D. M. BURNS, Secretary of State.

SKILLFUL SURVEYING WORK.—The contract for sinking the Maryland three compartment incline shaft on the eastern extension of the Idaho quartz mine, Grass Valley, was let to Edward William Parr, and was commenced on the 12th day of June last. In less than 10 weeks from that time they had completed their work in a very true, substantial and workmanlike manner. The incline is 125 ft., and the angle is 68°. This shaft strikes the drift at the distance of nearly 1,000 ft. from the tunnel entrance. The tunnel was run from near the foot of the mountains, a distance of 700 ft., and struck the Idaho ore vein, and then a drift easterly for 300 ft. along its course. At this point an upraise was started, but subsequently abandoned on account of water flow and the slippery and treacherous character of the ground. Mr. Bethell then made the necessary surveys to locate and start the shaft from the surface. The tunnel and drift were found to be tortuous and crooked, there not being less than 20 angles along its course, yet with such precision were these angles taken and measurements made, and with such care and accuracy were they carried for nearly 1,000 ft. over an abrupt, brush-covered mountain, that together with the exact elevations and calculations made, the slope of the foot wall was struck at a depth of 70 ft. precisely; and the shaft terminated at the end of the drift below without an inch of difference. Such very correct surveying is seldom performed, or indeed heard of. It is the intention of the directors to continue the sinking of the shaft, and very high expectations are being had as to the ultimate value of the mine.—*Grass Valley Union.*

AT REST.—Elijah Dewey Waters, Sr., died at Stockton on the 4th inst., of Bright's disease of the kidneys. Mr. Waters came to California from Bennington, Vt., in 1853, and his was one of those families well-known in moral and religious circles in those early times. While in the East he was engaged in commercial business, and was at one time here, for several years, connected with the *Mercantile Gazetteer.* His sons, Dewey and Frederick, learned the printing trade, at which the latter is still employed. Mr. Waters always devoted his efforts to the best interests of society in his newspaper connections. His liking for agriculture lasted him through life, and he enjoyed greatly a few of his latest years on the ranch of his son, near Stockton. We believe he was at one time the most elderly member and attendant of the Stockton Grange. His life was kindly, unobtrusive and useful.

News in Brief.

RAIN storms prevail at Portland, Or.

FROSTS prevail in the vicinity of St. Louis.

THE coal miners at Nanaimo, B. C., have struck.

ANOTHER brick block is going up in Gridley.

A NEW $20,000 sawmill is to be built at Seattle, W. T.

THE losses by the fire at Austin, Nevada, foot up about $50,000.

THE Petaluma Woolen Mills are turning out 700 yards of cloth daily.

RUSSIAN river, at Guerneville, has been stocked with black bass.

THE new Welland canal is open, and vessels are being towed through.

THE pay roll of the Virginia & Truckee railroad for August amounts to $35,000.

THE fire on Mt. Tamalpais, Marin county, is still raging, but with diminished force.

THE passenger time between St. Louis and New York is to be reduced to 28 hours.

A SPECIAL Court-martial is to be ordered to try Mason, who attempted to kill Gnittean.

LABOR is unattainable at Victoria, B. C., and there is an increasing demand for real estate.

THE fastest four-year-old stallion time on record was made at Oakland by Romero—2:22¼.

IT is expected that the Mexican Central railroad will reach Chihuahua in six months.

LAST week 7,340 immigrants arrived in New York.

HORACE HAWES, of San Francisco, ran 220 yards, Thursday, in 21 3-5 seconds—the fastest time on record.

ALBERT HART, Private Secretary of Gov. Perkins, was painfully injured by a fall at San Jose, Thursday.

THE estimated cost of the narrow gauge railroad which is now being talked of in Los Angeles, is from $5,000 to $6,000 per mile.

FOR the last two or three days extensive brush fires have been burning over the mountains some 30 or 40 miles east of San Diego.

WHEN the question of State division was up before, says the Visalia *Delta*, it received 16 supporters in this county. Out of this number several have since died.

ON the line of the Atlantic and Pacific railroad between Albuquerque, N. M., and the end of the grading operations in Arizona, about 350 miles there are 240 saloons.

MUCH anxiety is manifested, says the Anaheim *Gazette*, by the orchardists in the southern and western parts of the city on account of their trees putting out full blossoms out of season.

A ROLLING mill is to be established by a number of Oakland capitalists, at West Oakland. Prominent among the promoters of the same are F. K. Shattuck, A. Chahot, and A. J. Snyder.

THE grading on the Oregon and Nevada railroad has been completed 20 miles from Reno. Ten miles of rails have been laid, and as soon as the iron arrives a mile of track will be laid daily.

IT is said that France has proposed and England has accepted, a proposal that an Anglo-French military commission he appointed to re-organize the Egyptian army, so as to prevent any future revolts.

LIONEL SACKVILLE WEST, successor to Sir Edward Thornton as British Minister to the United States, will sail from Liverpool for Philadelphia on the American steamer *Pennsylvania* on October the 15th.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

O. W. MCGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CROWELL—Yuba and Sutter counties.
D. W. KELLEHER—San Mateo and Santa Clara counties.
C. E. WETMORE—Alameda county.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct, or if the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto valled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M. daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

ANNUAL STATISTICIAN of 1881.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 516 California st. Price, $4.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Consolidated Virginia Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given that, at a meeting of the Board of Trustees, held on the twenty-second (22d) day of August, 1881, an assessment, (No. 16) of Thirty (30) Cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, 309 Montgomery street, Room 26 (Nevada Block), San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fourth (24th) day of September, 1881, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on Saturday, the twenty-second (22d) day of October, 1881, at the hour of eleven (11) o'clock A. M., at the office of the Company, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. W. HAVENS, Sec'y.

OFFICE—Room 26, No. 309 Montgomery street (Nevada Block), San Francisco, Cal.

The Oxford Beta Tunnel and Mining Company.

Location of principal place of business, San Francisco, Cal. Location of works, Aurora, Esmeralda County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the Twentieth (20) day of August, 1881, an assessment, No. Twenty-nine (29), of Twenty (20) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Rooms of Dr. Knowles, 118 Dupont street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the Twenty-sixth (26) day of September, 1881, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the Seventeenth day of October, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

GEO. H. PECK, Sec'y.

Office—Rooms of Dr Knowles, 118 Dupont street, San Francisco, Cal

Scientific, Mining and Other Valuable Books.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL.

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, $7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, $3.00 coin, postage free.

WHEELOCK
AUTOMATIC CUT-OFF ENGINE

INDORSED BY THE MOST EMINENT ENGINEERS OF THE COUNTRY AS THE MOST ECONOMICAL AND PERFECT WORKING ENGINE NOW MADE AND THE BEST PIECE OF STEAM MACHINERY THE MECHANICAL INGENUITY OF THE TIMES HAS YET PRODUCED. CAN BE SEEN IN OPERATION AT THE PACIFIC IRON WORKS, RANKIN, BRAYTON & CO., SAN FRANCISCO. SEND FOR CIRCULAR.

LUTHER WAGONER. JNO H. HAMMOND

WAGONER & HAMMOND,
MINING ENGINEERS,
No. 318 Pine St., S. F.

MRS. J. BEARBY, M. D.

N. B.—Diseases of Women and Children a specialty

Prompt attention given to correspondence.

Office and Residence, St. Ann's Building, opposite Baldwin, room 81. Hours, 1 to 4 P. M. Take Elevator from Eddy street.

WANTED.

A position by a metallurgist (of German School) copper and lead smelter and assayer.
Address "METALLURGIST," this office.

This paper is printed with Ink furnished by Chas. Eneu Johnson & Co., 509 South 10th St., Philadelphia & 59 Gold St., N. Y. Agent for Pacific Coast—Joseph H. Dorety, 527 Commercial St., S. F.

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.

The Best is the Cheapest.

AVERILL MIXED PAINT.

THE PIONEER IN MIXED PAINTS. Is prepared ready for immediate use, and of any shade or Color desired. Any one who can handle a brush can apply it. It is impervious to our damp atmosphere, and is equally as good on Wood, Stone or Iron Work.

It does not **Crack, Chalk or Peal Off**, but retains for years that beauty of finish for which it is so justly celebrated.

Sample Cards of Colors, Testimonials and Price List furnished free, on application to

O. S. ORRICK, General Agent for Pacific Coast,

403 Market Street, - - - - Opposite Front, San Francisco.

TONITE.

Miners! Attention!

With the approach of winter, the dangers which attend the handling and use of all Giant Powders (Nitro-Glycerine mixtures) are increased.

The lives annually sacrificed in thawing or using frozen cartridges, should be a warning to all to abandon Powders which freeze at 42° Fahrenheit. All Nitro-Glycerine Powders freeze at that temperature, and now for the first time Miners on this Coast have an opportunity to AVOID THESE DANGERS.

TONITE NEVER FREEZES!

NOR IS THERE ANY LIQUID SUBSTANCE IN IT TO LEAK OUT.

It is Always Ready for Use, as well in the Coldest Regions as the Tropics.

☞Miners are cautioned to take no stock in the slanderous reports about TONITE circulated anonymously or otherwise by the Giant Powder Company. They are all untrue.

THE O'HARRA
CHLORIDIZING FURNACE.

Patented in 1878.

SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and ons for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

—o—

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Froiborg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurizo and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1 10 per ton to work 40 tons in 24 hours.

At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61½.

Lewis Chalmers, of the Isabella G. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenial sulphurate of silver up to from 84% to 95% of the assay.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, OCTOBER 1, 1881.

VOLUME XLIII Number 14

New Vertical Mining Wheel.

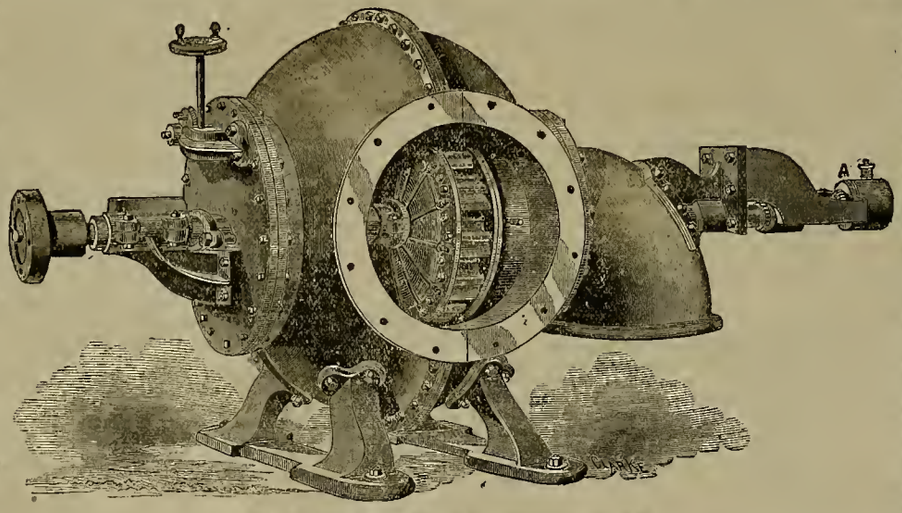
We illustrate on this page a method comparatively new in the application of turbines to mining purposes. The engraving gives a view of the new design and patented casing made by James Leffel (Parke & Lacy, 21 Fremont street, agents) intended to be a more convenient modification of the patent globe case.

The object attained in this new arrangement is economy of space and the application of an extremely small inlet and headpipe; this latter being accomplished by a peculiar and patented arrangement in the upper or interior part of the casing. The design effects also a great saving of power, by means of the use of anti-friction bearings which can be oiled, the whole being accessible and subject at any time to examination. The design is intended particularly for mining purposes, and for small wheels under high heads, where the use of gears is not only difficult of arrangement and of keeping in order, but frequently impracticable otherwise.

The horizontal shaft of the water wheel, on which is placed a pulley, affords the most efficient means of connecting the power to the point where it is desired to be used. This is easily effected, and any amount of power transmitted and motion obtained that may be desired, by properly proportioned pulleys with light but sufficient belting. The method, however, is not only applicable to mining purposes, but frequently may be attached to saw-mills and other machinery where a simple and efficient arrangement is desired.

At present they are making the wheels on this method for the sizes up to our 23-inch inclusive, and possibly may adopt the same plan for still larger sizes where the peculiarity of the situation will render the application of this method most practical. Of course, in the wheel proper is retained the essential principles of the improved James Leffel double turbine wheel.

This arrangement is excellent for mining pumping and other purposes, and where it is desired to have the greatest power in the least possible space, having the smallest conducting pipe that can be used and the simplest communication of the power to the work.



LEFFEL'S NEW VERTICAL MINING WHEEL.

A NEW MINING DISTRICT.—C. W. Gilbert who has been engaged in mining for some years near the Churchill county (Nev.) line, informs the Winnemucca *Silver State* that a new mining district discovered by Wallace Goodell, and named Bernice, promises to be one of the best south of the railroad. The principal ledge, located and now being developed by Mr. Goodell, is 8 or 10 ft. wide and carries at least 7 ft. of free milling ore, that assays from $50 to $250 per ton. There are only a few prospectors in the district, which is between 90 and 100 miles south of Winnemucca. They are not yet prepared to accommodate visitors, so if anybody contemplates a trip there he must go prepared with provisions and blankets. Now that there is no doubt of the richness and extent of the mines, the prospectors are making arrangements to build houses and lay in supplies for the winter.

TIME must be allowed for changes in all things and business. In mining this is particularly the case. Delving through walls of solid rock is about as slow work as can be imagined, under even the most favorable circumstances. When floods of water pour in and beat stifles, one wonders that anything worthy of the name of progress is seen.

PAIRED OFF.—Senator Fair has paired off with Senator Platt, of Connecticut, therefore it will not be necessary for him to leave the Comstock at present.

Tombstone District, Arizona.

Cochise county, Arizona, occupies the southeast corner of the Territory and is rectangular in shape. In dimensions, is about 60 x 75 miles. This county was created by act of the Territorial legislature in February, 1881, being carved out of the east end of Pima county. The entire part of this portion of Arizona was occupied by a roaming, rapacious, murderous band of Apaches, until into the year 1877. For many of the last years previous to that date their leader was the notable, cruel unrelenting, barbarous, but able chieftain Cochise. Under the military administration in the Territory, of Gen. Cook, this corner of Arizona was then for the first time opened up for the possible occupation of the whites. In that year—77—a single adventurous miner—Mr. Edward Schieffelior—discovered the silver-bearing leads in the Tombstone hills. As he started out upon his hazardous trip of discovery, his friends warned him that he would find his *tombstone* rather than mines. Hence the grim humor that suggested to him the name that he gave to the first mining location he made, and subsequently to the mining district. Early in '78 this pioneer prospector returned with a small band of friends to the new field which was so soon after to yield him his fortune, when was struck the first blow with a pick, with reference to development. Favorable reports of the discoveries soon brought other prospectors to the locality. Before the close of '79 two steam hoisting works were erected and in operation respectively, the Tough Nut and Contention mines. Also, in June of that year went into operation the first quartz mill of the camp—10 stamps, since increased to 15—erected on the San Pedro river, 10 miles distant, by the Tombstone M. & M. Co., to treat the ores of the Tough Nut and Good Enough mines.

In the year 1880, eight steam hoisting works were erected on seven different mining properties and four additional stamp mills, all in the valley of San Pedro. At this time (September, 1881), there are in all 14 steam hoisting works, six horse-power hoisters and seven stamp mills, with a total of 125 stamps, distributed as follows:

Grand Central	30
Western (Contention mine)	25
Head Center	10
Boston and Arizona, S. & R. (custom)	20
Hopkins (custom)	5
Tombstone ("Gird mill")	15
Tombstone ("Corbin")	20
	125

The full results of these mills in bullion production for the month of August is not yet fully made known, but, approximately, is as follows:

Western	$ 99,000
Grand Central	95,000
Head Center	25,232
Boston and Arizona	89,604
Tombstone	125,000
Total for August	$433,836
Total for July was	432,832
Total for June was	496,906

The output of bullion for the last two months (August and July) would have exceeded over a half million each but for excessive rains, which impaired the roads and interfered with the hauling of ores.

Miners to be Held for Damages.

The Board of Supervisors of Sacramento county a short time since made official inquiry of Henry L. Buckley, the District Attorney "concerning the right of the county of Sacramento to commence action against the hydraulic mining companies who use the beds of the American and Cosumnes rivers as a place for the deposits and wastage of the debris of their mines." To this inquiry the District Attorney has replied as follows:

First—That if such deposits have already caused damage to any of the immovable property of the country, the company committing such damage is responsible to the county for such loss, and may be sued by it therefor.

Second—If such damage is continuous, that is, recurring in its nature, and is of such a character as to render any of the immovable property of the country useless for the purposes for which it was intended, or in any material degree less fit therefor, the county is not bound to wait until the property is further injured or destroyed, but may bring an action for an injunction, and thereby prevent the anticipated injury or damage.

Third—The duty devolved upon you touching the management, care and preservation of the county property implies your right of taking all legal measures necessary to accomplish that end, by suit or otherwise. The immovable property entitled to protection at the instance of the county from the avalanche of mud and sand, and in which she has a direct interest in having preserved, are the public grounds and buildings belonging to the county, her bridges, roads and highways.

Fourth—I agree that the damage to county property and interests under the protection from the continuance of hydraulic mining on the rivers named is too grievous to be longer borne, and that all the hydraulic mines tailing into the American and Cosumnes rivers should be enjoined before the commencement of the rainy season. To that end I am willing to co-operate with you in any desired manner.

The Day Mining Company.

The annual meeting of the Day mining company, was held last week. President Henry A. Fox, submitted a report, from which we extract the following: Since our last election I have to congratulate you on the development of a fine body of ore in our mine, which has every appearance of being of a permanent character. The administration has considered it advisable to purchase the Hillside property, consisting of the Hillside and Mendha mines (the latter necessary for obtaining lead flux for smelting), the smelting furnace, separating furnace, assay office and other buildings belonging to the Hillside property, and also the Fairview springs, and 250 acres of land surrounding same for the price of $30,000, $18,000 of which has been paid on account, and for the balance two separate notes of the company for $6,000 each have been given, one payable on the 25th of October, and the other 25th of December next. The acquisition of the Fairview springs is considered as most important and valuable, as it gives control of the only available supply of water in the district, and is at a sufficient elevation to allow pipes to be laid from it to the month of the Day tunnel. By removing the furnace there the cost of hauling the ore, $3 per ton, will be saved, and also the expense of hauling water to the mine, now averaging $500 per month.

From the Superintendent's (A. S. Gould) report, we take the following:

Have extracted and hauled to furnace 1,154½ tons of ore, of which 387 tons remain on furnace dump.

The Mendha mine property, which is at Highland, eight miles from the Day, has only come to the control of the company quite recently. We are now principally engaged in resystematizing the workings in order to facilitate and cheapen the extraction of ore as it is developed. Owing to the strange and continued disability among the men, by some supposed to be lead-sickness, I could not bring the mine at once to what I believed is its assured productiveness. At last the health of the camp is improving, and henceforth we shall not likely have any more trouble on this account.

We fired up the Day furnace (Bristol) for the first time on the 11th of July last, and on the 15th began the production of bullion. We were obliged to stop for repairs quite frequently, but nevertheless the yield to date, as appears by the clerk's books, is 2,065 bars, weighing 205,389 lbs.; total value, $36,710.74. Of this we have shipped to San Francisco 447 bars, weighing 44,712 lbs.; on hand, 1,618 bars, weighing 106,677 lbs. We also have 8½ tons fine bullion not yet sampled. A second boiler has been placed in position, and the old one is being repaired, so that in case of the failure of one, we can use the other, and not be obliged to shut down for want of steam. We have consumed 41,386 bushels of charcoal and find on hand 17,656 bushels. The receipts and expenditures amounted to $128,170, $45,000 of the receipts being from assessments, and $2,917 from bullion product. The election for Directors resulted as follows: A. K. Grim, Thos. Cole (Vice President), H. A. Fox, J. L. Brown (President), C. W. Beaver. E. M. Hall was elected Secretary.

THE recent discovery of a rich silver mine 10 miles from Deadwood was followed in 48 hours by the creation of West Virginia City, the election of a recorder, the settlement of 1,000 persons, and the opening of nine saloons and two faro banks. On the fourth day a daily newspaper appeared, and now a stranger entering the town would suppose it was established at least five years ago.

THE owners of the Ontario, Utah's great mine, are about starting a tunnel to run 6,000 ft., or a little over a mile, for the purpose of helping to drain the mine.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

Mining Projects in London.

Editors Press:—It may interest your readers to know the fate of the many new mining companies in London during the present year. From January 1st to August 1st there were 390 projects of all kinds. After deducting English and foreign railways, corporations and colonial loans, foreign loans, railway mortgages and preference stocks, debentures and tramway (street car) companies there remained 273 of what might be called "speculative" projects. Of this number about 20% were floated, the remainder fell through. Of the 273 projects 55 were gold and silver mining companies. The fate of these projects is shown in the following list. It will be observed that but a small proportion were floated, and a still smaller proportion admitted to a "settlement," that is, approved by the London Stock Exchange and permitted to be quoted on their official list as properly constituted and capitalized companies under the Limited Liabilities Acts of 1862 to 1880.

Name of Company.	Remarks.
Akankoo (Gold Coast) Mining.....£1	½ dis
Alpha Skull and Cavern Gold Reefs.....	
Asia Minor Mine.....	
Australian Company.....	
British Australian Gold.....	
California Gold, Colorado.£1	½ prem., price nominal.
Carta Para Gold.....	No price.
Central Wynaad Gold.....	⅜ dis.
Cherambadi District Gold...	
Chile Gold.....	½ dis.
Cootacovil Gold.....	
Dieu Donne Gold.....	
Dingley Dell Estates and Gold.....	
East Herodsfoot Silver-Lead £1	
Eureka (Nevada) Silver.....	No price.
Flagstaff District Silver.....	
Gold Hill.....£1	½ prem., price nominal
Gold Mining Association of Canada.....	
Gold Mining Trust.....	
Great Southern Mysore Gold £1	⅜ dis., price nominal.
Great Zaruma Gold Mining..	½ prem.
Guayana Gold.....	Not floated.
Havcu Gold.....	Title disputed.
Hoover Hill Gold Mining N. C.....£1	Officially quoted ½ prem. (subscribed 10 times over.)
Indian Consolidated Gold.£1	Nominally at par.
Indian, Kingston and Sandhurst Gold.....	
Indian Trevelyan Gold.....	Officially quoted ½ prem.
Keystone Gold.....	
Klondra Gold Mining.....	
La Conception Gold Mining.	No price.
Madras Gold.....	½ dis.
Mont Dore of Bournemouth	
Moscile Mines.....	
Needlerock Estate and Gold.	
New Callao Gold.....	No price. Subscriptions limited.
Newfoundland Consolidated Copper and Gold.....	Not floated.
Nilgiri Gold and Cinchona..	
Nine Reefs Gold.....	Satisfactorily subscribed, we understand.
North Ooregum Gold.....	
North State, N. C., Gold, Iron and Railway.....	Withdrawn.
Olathe Silver.....	No price.
Organos Gold Mines.....	No dealings.
Parcherry Indian Gold...£1	
Pierre d'Or Gold.....	
Providence Gold Mines, Grass Valley, Cal.....	Not floated.
Quartz Hill Con. Gold.....	
Rara Fortuna Silver Mining.	
Red Mountain (Colorado) Silver.....	
Silver Valley.....	Winding up.
Simon's Reef Consols Gold..	
Sosa-y-Mendez Gold.....	Partly subscribed.
Victorine Gold (Bonds).....	
Wentworth Gold and Indian Estates.....	½ dis.
Wynaad District Gold.....	⅜ dis.
Wynaad Glen Gold.....	

From this exhibit and the experience I have gained during five months' residence here, every day of which has been devoted to the capitalization of Pacific coast mines, I draw the following conclusions:

1. Prospects and abandoned mines will not sell at any price. People here want "going concerns" with a near prospect of permanent dividends.

2. Overvalued mines will not float.

3. To put a mine successfully on the London market it must not only be such an one as above described, the vendore must be prepared to defray expenses of "promotion," or, at least part of them. This includee the expenses of agent, solicitor, printing, advertising, etc. These vary from $5,000 to $15,000, according to circumstances.

4. A complete report, attested by a mining engineer of well-known skill and good reputation here, must accompany the offer. Also prospectus, maps, samples, etc., carriage prepaid. Also reference as to character of vendors for commercial integrity, etc. Mines taken up under other circumstanoee get into the hands of "shady" people here and will surely fall through.

5. A power of attorney to the agent to sell at given price. This must be drawn according to the English formula and before a notary, whose signature is attested by the nearest British Consul.

The market for first class Pacific coast properties is improving every day. I have succeeded in obtaining considerable capital already, and expect to obtain more. I shall leave for San Francisco about the 1st of October.

Alex Del Mar.

Del Mar's London Agency, 24 A Southwark St., S. E. London, Sept. 7, 1881.

Sights and Sounds on the Columbia.

Editors Press:—From the time one crosses the bar of the Columbia river, a continuous but varied panorama of beauty and grandeur greets the eyes until the arrival at The Dalles. For a person desiring a fortnight's recreation out of the beaten track of the professional tourist, I know of no other trip which en etrongly appeals to him of a moderate purse and an eye for the beautiful; especially if he be able to withstand the tendency to the *mal de mer*, and is sufficient of a sailor to retain a good appetite and get his money's worth out of the larder of the corporation which carries him over. It was six o'clock in the morning, and the waves were dancing and glittering in the sunlight, when the old steamship *George W. Elder* after a stormy passage of nearly 70 hours from San Francisco rested outside of the

Columbia River Bar

For an hour, awaiting the most favorable condition of the tide, to cross the sand reefs which obstruct the mouth of that mightiest stream of the Pacific slope. All admire the bright surroundings and the picturesque promontory on which is located Fort Canby, whose site is clad in refreshing green of pines and grasses. Yes, even the government soldiers, who have made the trip up in the steerage, detailed, machine-like, to the fort, seem to regard the change from wave to picket as "a consummation to be devoutly wished for." The hay is dotted with countless white and gleaming little sails—fishing smacks from the salmon canneries along the river, pulling in or resetting their nets, and examining their morning catch. It is this industry, mainly, which keeps alive the little

City of Astoria,

Which now loome in sight. The signification of the pretty name becomee apparent when we are told that John Jacob Astor established a trading-post here many years ago, even before American sailors had taken up the cry, "Fifty-four, forty or fight." "Boom!" goes the signal gun, and we glide up to what looks like a town on stilts. All the business portion of Astoria is built out over the water, and its main street is nothing but a long wharf. But back of this, on the steep hillside, among the pine trees stumps, are numerous pretty cottages, with an occasional pretentious residence, a church or school. Although still a mammoth industry, the salmon fisheries and canneries have not done such a rushing business for the past year or two as formerly, owing to a decline in the yield of salmon.

Your correspondent was shown through the cannery of Hume & Co., which is perhaps as large as any of those on this part of the river. All told, there are no less than 23 canneries within a radius of 10 miles. The canneries generally fit up their own fishing yachts or smacks with nets and all the requisite paraphernalia, at an expense of about $500 for each boat. These are then each let out to one fisherman, who hires his own assistant and receives 50 cents for each salmon, large or small, laid down in good condition on the company's wharf. The size of the meshes of the net, however, preclude the catching of any that are not of fair size—a plan whose merits are obvious, discriminating not only in the interests of the company, but preventing the extermination of the tribe by allowing the smaller ones to grow.

It was a novel and almost imposing sight to see piled up on the dock a heap of beautiful salmon, numbering, we were told, about 1,000 fish, weighing from 15 to 35 lbs. each. An average catch for one smack during the four months' season, I am told, is about 3,000 fish. It is not, perhaps, necessary to detail to the readers of the Press an operation with which most of them, either from reading or observation, are doubtless familiar. Suffice it to say, that from the time the salmon are cleaned, sliced up into chunks that are crowded into pound cans, soldered up, boiled, and the cans varnished and labeled, until they are tested and boxed up ready for market, is a process wherein they pass through scores of hands and numerous machines, consuming several hours' time. Upwards of 200 hands are employed, those in the cannery being mostly Chinese. Everywhere is visible neatness, economy and dispatch. During the time outside of salmon season, fish and several other canneries employ their time in canning beef and various meats, and their goods are shipped by the thousands of cases to all parts of the world. Although the observer may be traveling to see the beauties of nature, if his mind is of an inquiring or utilitarian turn, these things touch a responsive chord. While most plentiful near the mouth of the river, the traveler finds canneries occasionally as far up as The Dalles.

By noon the whistle pipes all hands aboard, and we are

Off for Portland.

Plowing a wide furrow up the broad river. There is an old idea, that if you desire one to appreciate the joys and delights of heaven, give him first a good strong whiff of the sulphur and brimstone of what the Revised calls "Hades." Doubtless there is philosophy in this, and it may have been the law of contrasts that helped to raise the enthusiasm of so many to such an ardent glow on that memorable afternoon and evening. The panorama unrolle, and we see here a stretch of woodland, there a rocky bluff; now a glimpse of a busy saw-mill, then a graceful little river steamer shoots by; and then we pass an island, luxuriant in its vegetation. Just before sunset Mt. St. Helens appears, followed by more distant glimpses of those kingly peaks, Adams, Rainier, and finally Mt. Hood, whose fair and graceful form piercing the skies, almost precludes the use of the masculine adjective, "kingly." These lofty peake so tower above their neighboring surroundings, that the Cascade range seeme but a great plateau, on which they rest like monarchs seated upon a mighty raised throne. They are not merely snow-capped—they are covered clear down to their waists in the fleecy envelope.

If the traveler finds the Columbia below the Willamette full of placid, quiet beauty, he will be agreeably enprised in proceeding up the river,

Through the Cascade Mountains,

To find the scenery infinitely grander, more beautiful, rugged and peculiar than he had anticipated. None of the celebrated rivers of the East combine all the distinctive types and features of the Columbia. We have here and there suggestions of the Hudson, now a glimpse of lagoon and hanging vine, which reminds one of Southern rivers, and then a ruggedness resembling the upper Mississippi and almost pertaining to the grand canyons of the Colorado; but through and above it all runs a distinctiveness of tone and feature which makes it the one Columbia—novel and original among rivers. One almost begrudges the time spent at breakfast after leaving Portland and before reaching the pretty military post of Vancouver, for fear he may lose sight of something en route that should be seen. Although the boats are well furnished and administer well the creature comforts, it is no temptation to remain in the cabin. The distance between Portland and The Dalles comprises a region which appeals most forcibly to those having a smattering of geology. Through four-fifths of the journey the river makes its way through the Cascade range of mountains, many of whose peaks are snow-clad, and some of them attaining an altitude of over 1,200 ft. Scientists differ as to the causes of this huge thoroughfare, cut through the solid rock. Some attribute it to glacial action, and back up their theories with arrays of data and figures, showing to their own satisfaction at least, that mighty rivers of ice first plowed their way with irresistible force through the everlasting hills to the Pacific. Others attribute it to volcanic, and point to the great peaks, Hood, Adams, Jefferson, Baker, St. Helens, Rainier, and others, standing almost to their waists in their own lava—the cooled flood which they have in past times belched out. According to these latter theorists, the lava contracted so in cooling as to make the mighty fissure which now forms the bed of the Columbia—not so large then as now, but worn greater by attrition and disintegration. The mighty basaltic cliffs rise perpendicularly in places, presenting a sheer wall without crack or crevice, over 300 ft. in hight. Suddenly the wall turns at an acute angle to continue for a ways its unbroken surface. Its sides are covered with mosses and lichens, giving it the appearance of a mighty and forgotten stronghold that has passed out of the world's history. Here and there the plash of a little cascade is heard as it comes over the edge of the cliff, first gliding, then ricochetting, and finally bounding, loses itself in its own rainbow-lined spray. Some of these lovely falls, which may be counted by the score, possess all the elements of beauty of the Yosemite itself.

It seems a pity that so grand a river as the Columbia should not have a clearly navigable stream throughout its length, but it is far from the case. In the 135 miles between Portland and Celilo, there are two great

Impediments to Navigation,

The cascades and the *dalles*, which have always been passed by railroad portages, since steam navigation began on the river. These necessitate much extra labor in the transfere and many handlings of freight.

Readers of the Press will please not confound the word *dalles*, as here need, with the brisk and growing municipality below, on the river's bank, called by that name. The word is often defined now as meaning rapids, but that is not comprehensive enough. The word is one of the French bits of rude eloquence by which the voyageurs of the Hudson Bay company described striking objects. Its original scope comprehended the pavement of a terrace, and did not so much apply to the current of the stream as to the banks and their immediate surroundings. Although no one word in our language is sententious enough to convey the idea in full, one writer has elaborated it into the phrase "broad flight of noble flagging," implying the grandeur of a noble terrace, and the splendor of the pavement of a palace. The whole character of the river here is changed, and what was seen a few hours ago as a majestic stream over half a mile in width, now seems like its former self turned on edge and crowded down into a crooked and angular gorge, across which a man could hurl a stone—a swift, seething and almost bottomless torrent. And all this gorge is chiseled out of rock that seems as hard and unyielding as iron. While Congress has been appropriating means for the assistance of navigation, it has concluded that money would be better spent in building a canal at the cascades, where it is but little steeper than are the St. Lawrence rapids, than here, where the laborers would have to cut, crash and rend with Giant powder, a distance of between six and nine miles. Accordingly, the government canal works at the cascades are in operation, and from present appearances are to consist of two strong walls in the river, close to the southern shore, through which the water can flow unvexed by the rocks that abound in the rapids, and which are formidable obstacles at low water. While under ordinary circumstances this might do, the planners of the work are much criticised because they did not build the canal on the Washington Territory side, where the mountains here do not terminate abruptly at the edge of the stream. It is a patent and acknowledged fact that the mountains along the cascades are rapidly disintegrating, and great beds of shale are annually sliding down. From present indications it will, although on a smaller scale, require as much vigilance to keep this canal clear from the debris which is honnd to slide into it, as it does to keep the Suez canal free from the shifting sands of the desert. The same remark applies in many places to the railroad now building between Portland and The Dalles. It looks like a dangerous location for a road, as no one is able to tell at what minute thousands of tons of loose, shaly basalt may not come sliding down on the track in an avalanche. However, time will prove whether these fears are well grounded.

W. B. Turner.

How to Buy Mines.

During the past five years the country, with the exception, perhaps, of the Pacific coast, has made wonderful progress in material prosperity, and such has been the accumulation of wealth at all the great business centers of the Eastern States that several of the more enterprising merchants and daring speculative operators have amassed colossal fortunes, while the condition of the great majority of the people has been largely ameliorated, and many have secured a comfortable competence. The effect of this vast aggregation of wealth has been to foster a speculative spirit, and such has been the eager demand for the stocks of almost all incorporated companies that the properties have gone up to figure that threaten an early and disastrous collapse for all such whose prosperity is not built on a solid foundation. Speculation is rampant, and the great gains secured by fortunate operators are a constant temptation to awaken the avarice of those who are anxious to clutch the glittering prize of wealth. In the investments of this eager throng of wealth-seekers, mining shares have held a secondary place, railroad stocks being the favorites in New York, and speculation in the rise and fall of grain tempting the cupidity of operators in the great western cities. The reason why mining ventures, though dabbled in to a considerable extent, have not proven favorite investments, is to be found in the questionable methods pursued by those unscrupulous operators who have monopolized the business of "promoting" mining properties. It seems to be impossible for an honest miner to sell his mine in the Eastern market, however good the the property may be, or however low the figure he may offer it at. A modest and comparatively obscure individual will not be listened to, even though he have the deed to an exceedingly valuable mine in his pocket. Tricky speculators, who have some high-sounding military title, or possess political or social influence, can sell a wildcat mine for ten times the amount the actual miner asks for his far more valuable property. This fact is so well known, that the prospector or miner whose mine is yet but partially developed sticks to his camp, and awaits, almost hopelessly, the influx of "capital," which by the development of other mines in the vicinity may possibly at last secure a market for his own.

If outside capitalists who wish to secure good mines at a low figure would send a trusty agent or expert into the mining fields to inspect properties and deal directly with the owners, they would avoid the payment of an enormous profit to the middle-man or promoter, who now secures the lion's share of the amount realized on sales. Such agent would find in every camp in Arizona plenty of promising prospects, owned by men who are too poor to develop them, which could be secured for a mere trifle, and many of which would open up into splendidly paying properties. The wealthy purchaser can better afford to run the risk of prospecting work than the poor locator; and as a large number of such prospects could be secured for the amount that would have to be paid for a single fairly developed property, we maintain that it would pay investors far better to take a few small risks of that kind than to pay a fancy price for a property bought from a speculator, who offers it to them under the glittering allurements of an extravagantly worded prospectus.—*Tombstone Epitaph.*

The Laramie *Boomerang* says: "It don't do to fool with Giant powder," said an old-timer yesterday in the *Boomerang* office. "It's powerful stuff. I had a $10,000 mine over in the Queen of Shelby district in '53, called the Goshallhemlock claim. I was offered $10,000 for it, with $5,000 in Sagebrush placer stock besides, if she opened up as well 10 ft. further down. We put in a blast of Giant powder, and when we went to make an examination, we could not find the Goshallhemlock with an assessor and a search warrant. The hole was there, but there wasn't quartz enough to throw at a yellow dog. My idea is to sell a mine just before you put in the Giant powder, and then if the buyer wants to blow the property into the middle of Christmas, let him do it."

Another vein of coal has been found in the Central mine, Monte Diablo.

MECHANICAL PROGRESS.

Possibilities of Cast Iron.

There is a class of cast-iron work, says the *Metal Worker*, that formerly was imported more extensively than now, which gave us minute articles of use, and even ornamental appendages to dress, so light in weight and so apparently fragile in form as to suggest fine hand labor. It was supposed that we had no material or means to reproduce such diminutive and fragile articles from cast iron. But recent improvements, both in material and manipulation, prove that we can almost equal the delicacy of what is known as "Berlin iron." Fine charcoal iron possesses wonderful properties of fluidity when in a molten state; it finds its way into the smallest interstices of the mold, and comes out cooled, a definite reproduction of the imprint of the pattern. So exact is this reproduction that bare lines, to be represented only by very fine wire, come from the mold perfect in form and quite tenacious in texture. Articles of cast iron, cast in a mold of sand, which require 50 or 100 to balance a quarter-pound weight, are as readily produced here as articles weighing pounds. It may be doubted if any metal is capable of producing more diminutive objects than iron. As instances of the possibilities of charcoal iron in castings, let anyone examine the delicate shoe-buckles and belt-buckles, the shawl-clasps and ornamental hairpins, called steel, which bear a burnished surface rivaling that of silver. He will find they are of cast iron, very brittle, and showing a bright iron fracture. Quantities of these articles are made in England. They are said to be cast in sand molds, the same as masses of iron are cast, and that come out as perfect as the heavier castings. In short, the possibilities of cast iron range from the utmost capacity of adjoining cupolas, capable of melting 30 tons, to the hand-ladle that with 10 lbs. of metal, pours for a thousand separate articles.

Small Steel Castings.

The reader will find the following of interest in immediate connection with the above: A correspondent of the *Ironmonger* recently asked for information as to how steel castings could be made by the consumers, instead of paying a long price and submitting to vexatious delays in obtaining them from Sheffield, decided me as to the advisability of completing some experiments on which I was then engaged, some of the results of which I now give, in the hope that others who know more of the subject than I do, may be willing to give me and other of your readers the benefit of a few hints. After some failures, I found the following mixture give a very good looking and sound casting: 35 lbs. Bessemer rail ends, cut small, 12 lbs. No. 1 hematite pig, 8 lbs. broken unannealed castings or runners, 1 lb. spiegel. I used green-sand molds, composed of 12 parts Mansfield sand, 1 part coal dust, 1 part charcoal. These were well vented and dusted with plumbago. Of course these proportions may be modified to suit the class of work required. I cannot say that the castings are entirely free from air-holes, but they are not worse in that respect than those we buy. I did my melting in plumbago pots from Battersea, and did not find that there was any difficulty with the carbon in the pots. The annealing I accomplished in an oven without care. I would strongly urge my brother founders who have now to purchase steel castings to make them themselves. There is no real difficulty about it, and although there may be a few mishaps at first, a little perseverance will speedily overcome all obstacles. I may add that I myself effect a considerable saving by becoming my own crucible-steel founder.

"Iron Sponge" for Gas Purification—A New Industry.

Iron sponge is a term quite unfamiliar to the average reader, although the manufacture of that article is now one of the established industries of the world.

For the benefit of the uninitiated in the manufacture of gas, we will explain the nature of the new product and its uses.

Coal gas, after being washed and condensed, remains heavily charged with impurities in the form of sulphuretted hydrogen, ammonia and carbonic acid, which must be extracted before the gas is fit for consumption, otherwise the odors emitted by the gas while burning would be unbearable.

To remove these impurities, *lime* has—until within the last three years—been universally employed, being considered the cheapest and most effective absorbent, although its use entailed many disadvantages. As it could be used but once, the rapid accumulation of "spent lime" with its accompanying odors—familiar to all persons living near gas works—necessitated hauling the same outside the city limits, in many places being an expense of no little importance.

Various experiments were made by those interested in the manufacture of gas to find an absorbent equaling lime without its disadvantages, and success was finally attained some three years ago.

Iron sponge, the term given the successful rival to lime, is obtained by treating oxides of iron in contact with carbon at a suitable heat with complete isolation from the atmosphere, and its peculiar spongy texture is caused by the loss of the volatile matter which, separating from the ore, leaves minute cells and spaces throughout its entire mass, rendering it extremely sensitive to chemical action.

After being used and becoming thoroughly saturated with impurities, it is exposed to the atmosphere for two or three days, which thoroughly revivifies it, and it is again ready for use; the same material being used over and over again for the period of from one to three years, depending upon the condition of the works, character of the coal used, etc.

The advantages claimed for iron sponge over lime are, greater economy, saving of labor, odors, etc., and it would seem not without reason, for since its introduction into the gas works of this city, it has been adopted in Philadelphia, Cincinnati, Chicago, St. Louis, Kansas City, Sacramento, and scores of other works of less importance throughout the country.—*Am. Manufacturer.*

Novel Driving Belts.

What may be termed a "revolution in belting" is predicted by the patentees and manufacturers of a novel driving belt, called the "perpetual tension belt," of spiral wire, either brass or steel, as desired. While at work the belt is continuously changing its exterior position, or, in other words, is rotating at right angles to its line of motion, while passing round the pulleys, thus wearing the surface of the coil uniformly. The ends of the belt are fastened together by screwing flexible plugs into the ends of the coil, one being formed with a hook and the other with an eye.

This belt can be used either with V-shaped grooved pulleys, or concaved toothed gears. The principal points of advantage claimed by the makers are, that it maintains a uniform tension, compensates for varying resistance and distance, utilizing a much higher degree of power expended, and obviating other difficulties heretofore experienced in transmitting power by belting. It is claimed that it never requires taking up; gives no trouble with belt hooks or lacing; runs sewing machines with one-third less labor; will outwear a great many ordinary belts; is not affected by the weather; that the wear of machinery is lessened, and that it has better adhesion to pulleys. The same device can also be applied as a sash cord, for window frames, and as a door spring to close doors. Besides running ordinary machinery, it has been used successfully on sewing machines, scroll saws, hand-blowers, steam-engine governors, lathes, etc.

Still another novel driving has recently been patented, which is described as a steel ribbon lined with leather. The patent is issued upon the novel method of connecting the metal and the leather.

Antiquity of Trade Marks.

The question has been asked somebody, "How old are trade marks?" who answers it by saying that they seem to be nearly as old as the industry of the race.

Ancient Babylon had property symbols, and the Chinese claim to have had trade marks 1,000 years before Christ. Guttenberg, the very inventor of printing, had a lawsuit about a trade mark, and he won it. As early as 1300 the English parliament authorized trade marks, and the laws of America have always protected them. The theory by which a suit is brought for infringement of a trade mark is that its use deprives the originator of his property, and deceives the public as to the article. Extraordinary means have been required at all times to guard against the fraudulent use of marks of manufacturers.

In ancient times the greatest importance was placed upon the marks of individual workmen, because, as in the case of the armorers, valuable lives often depended on the quality of the workmanship. One old author complains that certain good and true soldiers were killed simply because the workmanship of their swords and arms were not good, and failed them when in battle. Very early, therefore, it was found necessary to make stringent laws against counterfeiting trade marks, and against scamped workmanship. Without protection in this one particular, trade would almost come to a standstill, because there are very few things, comparatively, that can be purchased on their merits, judged at the moment. In general, we know the quality of goods by experience, and it is only after they have been in use that a certain judgment can be pronounced upon their quality. Having, then, once found that a certain workman's productions are good, we seek them again in the market. If we have no means of identifying his trade mark the whole work of buying becomes a haphazard affair. The best goods at once lose their value. This was early discovered, and probably the successors of Tubal Cain were the first to use distinctive marks on their manufactures.—*Carpet Trade Review.*

SCIENTIFIC DISCOVERIES THEN AND NOW.—It seems to have now become the fashion in Germany that every new discovery in the field of chemistry of artificial dyes is announced to the world by means of a patent, while formerly every discovery was first published by a communication to the Chemical Society of Berlin, or by an article in some chemical paper.

SCIENTIFIC PROGRESS.

The Study of Thunder Storms.

Studies of special phenomena have become very popular since it has been found that valuable results are often obtained in this way. Recently, a French gentleman—M. Lespisult by name—has been studying the subject of thunder storms in the Gironde, and comes to the curious conclusion that valleys are more struck by hail than hills or table land. It seems that a certain depth below the clouds is necessary for the formation or the fall of hail to occur without obstacle. Further, the direction of the valleys traversed have a marked influence on the direction of the clouds, though they only cause a momentary deflection, and the clouds, after following them a certain time, are carried on in the general direction of the vortical movement. For example, if a valley be in the axis of the zone of hail, or a little inclined to that axis, the hail clouds seem to be carried along that valley as dead leaves are carried along by the wind in a trench. If the valley be subdivided by a mountain spur into two others, the hail cloud also divides and the two secondary valleys are ravaged in their turn, at least to the extent in which they are within the zone of hail. Valleys lying across this zone have also an influence, though less marked. When the clouds pass over them they show a tendency to descend and to spread out on the two sides of the zone, so that the zone is broader over valleys than over plateaux, and the ravages are often greater. It might have been added that this was to be expected, since storms and air currents of all kinds generally follow the depressions of the earth, being guided by the hills to a very great extent.

NEW ELECTRIC PROPERTY OF SELENIUM.—Blondlot attaches to one of the poles of a capillary electrometer, by means of a platinum wire, a fragment of annealed selenium; to the other a plate of platinum. If the selenium is brought in contact with the platinum, by an insulating rod, the electrometer remains at zero; but if the selenium is rubbed against the surface of the metal the electrometer is immediately powerfully agitated. A deviation may thus easily be obtained, equivalent to that which would be produced by a cell of sulphate of copper. Neither the friction of two metals against each other, nor that of two insulators, can produce any charge. The selenium current flows through the electrometer from the unrubbed to the rubbed selenium, consequently the disengagement of electricity cannot be attributed to the heat which accompanies the friction.—*Compt. Rend.*

THE artificial production of nitric acid and nitrates by direct union of nitrogen and oxygen in the presence of watery vapor, through the agency of the electric spark, has long been known to be possible. The late improvements in electro-magnetic machines has attracted attention to this method of producing nitric acid and nitrates on a commercial scale. A Belgian journal asserts that such a process is actually in use, though with what success we are not informed. An electric-magnetic machine is made to discharge a continuous stream of sparks through a series of closed vessels, through which a current of air is passing. Red nitrous fumes are produced, which are carried with the air current to a condensing tower, in which caustic potassa solution is descending. The result is a moderately strong solution of saltpeter. The process is very interesting, but its economy, in a commercial sense, is very questionable.

TRACKING STORMS ACROSS THE ATLANTIC.—The *Nautical Magazine*, of London has been tracking American storms across the Atlantic, and finds that 63% of those starting in this country reach Great Britain. As it takes them several days to make the voyage across the ocean, the proposed international exchange of meteorological reports by cable ought to enable the inhabitants of England to know very nearly what sort of weather they are going to have. As storms seldom cross from Europe to this country, we are not as much benefited by this interchange. It will be, however, of great advantage to us, as well as the whole world. Meteorology is a science developed but slightly. In time, the guesses of "Old Probabilities" will be reduced almost to certainties, and our farmers be enabled to know exactly what kind of weather we are going to have a week ahead.

A LARGE COLLECTION OF SPIDERS.—Capt. Holden, of Cincinnati, Ohio, is credited with an exceptionally valuable collection of spiders, numbering nearly 25,000 specimens, and embracing 4,000 species. They are arranged in bottles, with labels giving name, collector and locality. California furnished 5,000 specimens, and New England as many more. One species is represented by 108 specimens, from all parts of the United States, showing how much effect environment has in modifying form. The collection is supplemented by a full and complete catalogue of the literature of the subject, comprising about 70,000 references on 10,000 cards. This valuable contribution to the study of this little-known branch of natural history he hopes to complete and publish at an early day.

The Electric Candle in Vacuum.

Sir Humphry Davy was the first to note that the voltaic arc became longer when confined in vacuum, and that the carbons were not consumed. In Jamin's experiments with the electric candle in vacuum, it has been found that when thus confined, or when hermetically sealed in vessels containing inert gases, the carbons are not acted upon. Such a gas is nitrogen, acetylene, carbonic oxide and marsh gas. Most other gases are decomposed by the arc; for example, steam gives carbonic oxide and acetylene, carbonic acid doubles its volume and changes into carbonic oxide, and the hydro-carbons, especially vapor of petroleum, is decarbonized, and produces filaments of coke connecting the carbon points. This action is employed to good purpose in fabricating the carbon loops for the Maxim incandescent light. Air in the sealed vessel offers a peculiar interest. First, there are seen vapors produced by the combination of oxygen and nitrogen; but this combination is soon destroyed, and the gas appears colorless again, because of the oxygen combining with the carbon. Nitrogen and carbonic oxide then remain in the vessel. While the hyponitric acid vapors are in the vessel the arc changes in tint and elongates; but at last, when the chemical transformations are complete, the arc is good and of a greenish blue. The important point, however, it is stated, in a practical sense, is that it becomes quite fixed, and varies neither in color, position or intensity, as all naked arcs, however well regulated, still do. The spectrum is that of carbon raised to incandescence without burning, a spectrum such as has been observed in the tail of the recent comet by M. Thollon.

On the other hand, the spectrum of a naked arc glowing in the air is complicated by that of burning carbon. In an inert gas, therefore, the arc is a purely electric phenomenon, and it can be directed by electro-magnetic action. The ordinary arc, again, is composed of this electric incandescent current, and the flame due to the burning carbons and their irregular waste. The cessation of burning also stops the waste of carbons. When the Jamin candle burns in the open air it is consumed at the rate of 16 millimeters per hour; when closed in a sealed vessel this consumption is reduced to 0.2 millimeters per hour. Each candle lasts 160 hours, or 16 times longer than when burned free, and each lamp 800 hours, or 80 nights of 10 hours each. Not only the fixity of the arc, but its durability, is thus very much increased.—*Iron Age.*

THE ACTION OF OXYGEN ON MERCURY.—It is currently believed that oxygen combines to a small extent with mercury at ordinary temperatures, but recent experiments of M. Amagat, communicated to the French Academy of Sciences, have demonstrated that when both these bodies are pure and dry they are without action upon one another, at least for a considerable time. The above error was introduced into science on the high authority of Reguault. M. Amagat arrived at his results by means of a Pouillet apparatus, having nitrogen in one manometer and oxygen in the other, with the metal in presence of both. Although kept for more than a month in the apparatus, the surface of the mercury in presence of the oxygen remained as brilliant as that in presence of the nitrogen.

SPECTRA OF FIRE FLIES.—During the past summer Mr. W. G. Levison, of Brooklyn, N. Y., has studied the spectra of the light of fire flies and other light-producing insects. He finds that the ordinary small species of fire fly gives a spectrum from which the blue and violet are omitted, and that in all cases examined the less refrangible rays predominate. Phosphorescent oils and glowing phosphorus give a spectrum consisting of green light only. A fire fly that is injured and glows permanently seems to give a nearly similar spectrum, but the bright light given by the insect when living affords an entirely different spectrum, as mentioned above.

GREEN AND RED LIGHTS IN VEGETATION.—Why will grass not grow under our trees? M. Paul Bert has shown that green light hinders the development of plants. Plants inclosed in a green glass frame wither and die as though they were in darkness. M. Regnard finds that plants specially require the red rays. If sunlight is deprived of the red rays the plants soon cease to thrive.

AN ASTRONOMICAL CONGRESS is about to be held at Strasburg, which will be visited by many eminent astronomers from all parts of the civilized world. Strasburg was chosen because in its new observatory the best and most modern astronomical apparatus are to be found.

LEMON JUICE IN DIPHTHERIA.—Dr. I. R. Page, of Baltimore, calls the attention of physicians, in the *Medical Record*, to the topical use of fresh lemon juice as a most efficient means for the removal of membrane from the throat, tonsils, etc., in diphtheria. He states that in his hands it has proved the best agent that he has as yet tried for the purpose. He applies the juice of the lemon to the affected parts every two or three hours by means of a camel's hair probang. In 18 cases in which he has used the remedy the effect has been all that he could have wished. He finds that several of his professional brethren are prepared to give the same favorable account of the remedy.

Mining Share Market.

There seems to he no special excitement in the stock market, and fluctnations have not heeu marked. On the Comstock, the big snction fan at the mouth of the Consolidated Virginia shaft is doing good work. It was drawing out and sending up an immense volnme of steam. It will soon cool off the lower levels of the California and Consolidated Virginia mines. Men have heen set to work at all the important points in the two mines.

At the Yellow Jacket they will eoon make a connection between the 3000 and 2828 levels, which will enable them to do some prospecting that will probably develop something of value. It is known that they have a solid body of qnartz over 80 ft. in thickness that shows low essaye in the only place where it was ever explored, even with the drill.

The *Enterprise* says: Although the management of the Sierra Nevada are reticent in regard to what is heing done and what is to he seeu at the hottom of the joint Union Consolidated winze, yet enough hes heen said ahont the condition and prospects at that point to warrant as high or higher pricee than the stock of that coupany reached at any time after it was announced that ore had heen found. Undonbtedly at the time Senator Fair gave it as his opinion tbat what had heen found was an ore body, and gave the public to nnderstand that the whole hottom of the winze was in ore, he was eaying what was so and what he believed would prove to hs the case. As the wiuzs must have heen in ore for some distance before sufficient was fonnd to cover the hottom of the winze, and as it would he necessary to sink considerahle fnrther before the ore would pass ont of the winze, there mnst have heen a deposit sufficient to justify any advance in the stock that has been seen. We know that at one time snfficient ore was eeen in the hottom of the winze to warrant Senator Fair in helieving that an ore body had been fonnd, and we do not yet know that the ore has left the winze; indeed, he himself says that only the management and the men that are doing the work can say that the bottom of the winze is not still in ore. What has heen fonnd will no douht he made known when it ie thonght hy the officers of the company to he for the hest interests of stockholders to throw the mine open to the public. Until the proper time arrivss it is not likely that any outsiders will he allowed in the mine, for to let in one man is equivalent to throwing the mine open to the public. There is a considerahle flow of water to he handled, hnt the work of exploring the ore fonnd is undouhtedly heing pnshed as rapidly as possihly.

FROM El Dorado comes the newe that Salkeld & Eckhardt have closed a contract for the immediate erection of a 20-stamp quartz mill at the Monnt Pleasant mine, Grizzly Flat.

Copper in New Mexico and Arizona.

The lively interest in the copper properties of Arizona and New Mexico hae given rnmor tbat the President of the Calumet and Heola company, Prof. Alexander Agassiz, is about visiting the Southwest with a view of thorqughly investigating the mines of that fahulously rich region. Prominont English mining experts are now visiting the Old Dominion copper mines in the interest of a syndicate of English capitalists. They state that the Old Dominion has the richest copper vein ever nncovered. And it is not an improhable statement to make that with such reports as come to the surface respecting the great ontcroppings of the Old Dominion, and the rich discoveriee now heing made in New Mexico, that the price of the Calumet and Hecla shonld he in at the fore. There is no reason to snppose that any very decided chenge would take place in the stock of the Calumet, and yet great mines are not unlike great men, they have their day; and shonld it he a fact that Prof. Agassiz sees well the situation, he, in his keen observation, is donbtless intent upon a thorough investigation of Arizona and New Mexico copper properties. Calnmet has attained the apex in mining very few can expect to reach, and it is not improhahle, should the professor recognize either of the great copper interests of the Sonthwest, a connterpart to the Calnmet and Hecla may he found either in New Mexico or Arizona. Boston and New York have hoth a growing interest in the copper developments of the present day, and while Calnmet has inexhaustihle qnantities of copper rock, no one need he surprised should those in the control of this great honanza also be the controlling spirit of the coming copper bonanzas of the Sonthwest, first among whom may he the copper king, Prof. Alex. Agaseiz.—*New Mexican Mining World.*

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

PACIFIC GAS LIGHT CO.—Sept. 28. Object to construct and maintain works snitable for the manufacture of gas or other substance or material for purposes of illuminating, heating and all other purposes to which gas can be applied, and the sale, distribution and delivery thereof; the manufacture and sale of all kinds of machinery, instruments and appliances by which gas or artificial light of say description is now or may hereafter be applied to. The place of businese will be San Francisco. Directors—Frederick F. Low, Walter M. Castle, Egbert Judson, Henry M. Martin and Eugene E. Dewey. Capital stock, $2,500,000, divided into 25,000 shares, at a par value of $100 per share.

AMERICAN QUARRY CO.—Sept. 28th. Location, Kern Co., Cal. Capital stock, $10,000,000. Directors, R. H. Orton, W. G. Campbell, A. P. Flint, H. K. Belden, David Killing and H. H. Killing.

BRUSH CREEK G. M. CO.—Sept. 28th. Location, Sierra Co., Cal. Capital stock, $3,500,000. Directors, A. Bateman, H. H. Pearson, William Thomas, A. C. Wigbtman, S. E. Olmstead.

MINING SUMMARY.

The following is mostly condensed from journals publisbed in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

PACIFIO GRAVEL M. CO.—Cor. Amador *Dispatch*, Sept. 24: This company is operating at the beadand a little aortb of a locality known as Union Flat. It is generally supposed by all, or nearly all of tbe old residents of tbis mining district, who have made mining a study of a lifetime, that in snd under the ridge which this company is penetrating, an immense gold-bearing bed of gravel exists So strong is this belief in the minds of many, that their hopes are drawn from other worthy and more extensive enterprises and centered in this and circumjacent vicinities, and declare that the fate of our town rests upon this problem. The tunnel which is now bcing pushed energetically abead is in about 300 ft. It is designed by the company to continue work until a distance of 1,000 ft has been traversed, where the projectors believe the deposit exists. Work was commenced on this enterprise in the latter part of May last. I am told that improved machinery will soon be put in operatiou which will greatly accelerate the work. Several of our townspeople have considerable money invested in this undertaking. Mr. James Dean, an enterprising and ambitious young man is secretary of the company.

PIONEER DISTRICT.—*Ledger*, Sept. 24: This little mining camp, our correspondent says, continues quite lively. Mace's quartz mill has just started on 75 to 100 tons of rock of rich quality. The quartz mill runs during the night and the saw-mill during the day time. The McQuade, Cossack and Soto claims are still taking out ore. The work of sinking at the Volunteer mine is greatly retarded by the flow of water. The present hoisting facilities are totally inadequate to dispose of the water. It is tbought that the moisture comes from the ditcb, which flows witbin 50 ft of the sbaft. The Volcano G. M Co. will commence work in preparing for tho winter's operations next month. The Kennedy mill has been started up recently.

SUTTER CREEK.—Taking water out of the Mahoney shaft is progressing so rapidly that they expect to reach the bottom in a few days. It is probable that in the lower levels the accumulations of mud will require a week to remove. The mill is kept running on rock from tbe upper levels. At the Down's mine everything moves smoothly. Sinking will probably be continued at tho Amador Con. for two months yet, which will bring the shaft to a depth of at least 1,000 ft, when tunneling will be vigorously pushed forward. Baling water out of the Wildman is very slow work. It seems impossible to reduce tho water with present baling facilities.

CALAVERAS.

WATER.—Angels *Echo*, Sept. 24: The Union Water Co. expect to complete their big reservoir in the mountains in about two weeks. Owing to the lack of water, work has been suspended on the Raspberry mine for a few weeks. The water will be turned ont of the Union Water Co.'s ditch on October 1st, for the purpose of repairing the same. Very little mining will be done in this section for a month or so to come except by those who are not dependent on tbo Union Water Co. for water supplies.

THE shaft on the Jones mine is down about 75 ft, and they have commenced drifting northward. The ore, so far, looks well, and there is every indication that it will prove rich in silver.

EL DORADO.

FOROING AHEAD.—*Republican*, Sept. 20: The Faber gold mine, Marblo valley, Latrobe district, which has yielded considerable sums heretofore, principally in pockets, as high as $2,000 having been realized from the effects of a single blast, is now being systematically worked, with a view to opening a first-class mine in first-class shape. The shaft is now down 140 ft, and drifting has been commenced upon the ledge. Mr. W. W. Faber was in town on Saturday last to hire two or three good quartz miners, but had not been able to find any, out of employment, tbe last we saw of him, which speaks well for that industry in this vicinity.

INYO.

WORK RESUMED.—Inyo *Independent*: The Laura Co. has resumed the work of developing its property at Beveridge, having put on a force of 8 men during the week. There are now about 40 tons of very high-grade gold ore on the dumps, and many parties who have visited the property adjudge it to be even better than the famous Keynot. The Mexicans have put a much stronger force on the Keynot, and bave added greatly to their transportation facilities—the pack train. J. W. Murphy has purchased a train of pack mules from Al. Rohinson, for general work in the district, and especially to keep supplied the store and boarding house at tbo mill

MINING NOTES FROM BISHOP.—The followiog brief mining notes from the recently opened gold mines of Bishop Creek, from a reliable correspondent, comprise the latest information we have from thore: "The Poleta shaft is down about 265 ft, showing a splendid vein of the rich ore characteristic of the series; but no one, save the managers, can tell its average value in gold per ton. The vein is equal in width to tbe working shaft. The Red Cloud mine, owned by Rowan Bros. & Co, and under bond to Messrs. Loose & Russell, is now opened by a sbaft something over 100 ft deep, and shows a vein even wider than the shaft, and is more richer than that of the Poleta. Other important discoveries have been made lately—one about one mile and a half southeast of the Poleta mine, and owned by a number of Mexicans, which shows fine prospects in gold. It is called the Margnarita. Another one, which is located some 3 miles north of the Poleta, is called the Dauphin, the ore of which shows from 50 to 900 colors to the horn. This property is owned by Escalion, Whittaker and others. It is opened by a shaft about 10 ft deep, and the ledge so far has a uniform width of 4 ft."

BUILDING UP.—The town of Bishop Creek is rapidly improving, and, backed up by its extensive agricultural interests and the rich and most important new gold discoveries, is doubtless as prosperous a community as there is in tbe entire State, and with as bright a future before it.

LOS ANGELES.

PLACER MINES.—Los Angeles *Commercial*, Sept. 24. Mr. W. W. Jenkins, who bas just returned from San Francisco, has made arrangements for bringing out tbe water from the Sespe and Adams' creek by a ditch 14 miles in length to the Santa Feliciana placer mines. This enterprise will cost about $100,000. These gold placers are in Los Angeles county on the north side of the Santa Clara river and are very rich. The mines of Los Angeles are the oldest in California and have been worked for a generation, yielding at small expense over $6,000,000, and the work goes on every year. In the San Gabriel canyon are some fine quartz ledges, and every canyon from the San Fernando tunnel to the San Antonio is rich with various metals.

MARIPOSA.

MINE SOLD.—Mariposa *Gazette*, Sept. 24: Mr. A. G. Black, of Bull Creek, who was here last Tuesday, informs us that the Compromise quartz mine, owned by him, has met with a bonafide sale, and was on his way below to receive the cash. He did not inform us what amount the mine had been sold for, but insinuated that it was sold for the price he asked, and was a better sale than he really anticipated to make; besides it was sufficient to maintain him and his good wife in independent circumstances the remainder of their lives. Mr. Black has struggled for many years to make a raise out of mining, and has finally reached the goal of his long sought for happiness.

MONO.

BODIE.—*Free Press*, Sept. 27: The past week has been marked by no very great changes, but the usual work of

production and development has been in steady progress. The pump gear wheel of the Standard having given out no work was done in the shaft or the 1000 level of the mine. The new wheel is now on the way, and operations will soon be resumed at that point. At the Lent and Red Cloud shafts the usual amount of work is being performed. The west cross-cut from the 600 level of the latter is now in 172 ft. The stopes in the Ore mine continue to look remarkably well. That at the 440 level is 3 ft wide of very rich ore, while the 520-ft stope is 2 ft wide, also of exceedingly good ore. The concentrators are working successfully, and will doubtless run all winter. During the coming week it is likely that work will be resumed at the Champion mine. All of the mills, including the Standard, Standard-Bulwer, Neonday, Syndicate, Bodie, Silver Hill and Miners' are employed in crushing ore, and the bullion output is from $80,000 to $90,000 per week. Messrs. Adam Gillespie and John Wagner are about putting up heavy machinery for working tailings below the Bodie mill.

NEVADA.

Flooded Mines.—*Transcript*, Sept 23: Last Tuesday the valve to the new 10-inch pump at the Nevada City quartz mine got out of order, and before it could be put in working shape, the lower portion of the mine was flooded. The 8-inch pump recently taken out was put back, and with that and a drawing pump and tank the water is being kept below the 2d level. It will take some time to drain the mine. The Derbec gravel company is also suffering from too much water. A heavy stream was struck in the new shaft, and the men barely had time to get themselves out and save the pump. The water is now gradually lowering, and doubtless work will be progressing as usual in a few days. The Derbec has recently been giving employment to about 100 men, 20 of whom are said to be from this city.

Eureka Tunnel.—*Sentinel*, Sept. 22: The work in following up the recent development in this property is proceeding satisfactorily. The ore vein has been stripped a distance of 15 ft, and the drift stopped. Preparations are now being made to sink upon the ore, to determine its depth. A drift has also been started from the tunnel immediately opposite the one in which the ore was encountered, where an encouraging-looking streak of yellow chlorides is visible. If this meets with the same success as the other drift, the tunnel folks will be in high clover. The north drift nearer the mouth of the tunnel has reached the ore vein there found some time ago by following up a streak, and the face of the cut presents a very strong and encouraging appearance. It will take the limited force, however, some time to prosecute the work of development at three different points, and stockholders should not get disappointed if a real bonanza is not shown up in a few weeks. All the labor is systematically performed, and every blast promises better.

PLACER.

Developments on the O. K.—Placer *Herald*, Sept. 20: We learn from a reliable source that work on the O. K. mine, located near the Grass Valley road, about 2 miles north of Auburn, is being prosecuted quite vigorously by a Boston company, under the superintendency of Mr. B. L. McLain. It is expected soon to have the property in a shape that it will pay. The new shaft is now 60 ft deep, showing a ledge from 2 to 4 ft in thickness, of good milling ore. A drift has been started at the 50 level. The early history of this mine is good, there having been several crushings made from it that paid from $20 to $135 per ton.

PLUMAS.

The Corbin & Manson Mine.—Plumas *National*, Sept. 24: On Wednesday last, in company with Mr. Manson, a *National* reporter took a look through the rich drift claims at Elizabethtown, purchased by these gentlemen from Loring & Leavitt some months ago. Since coming into possession they have made many improvements, and intend to work the whole flat as rapidly as possible. The pay-dirt is now being taken from two shafts near the head of the claims, one of which has been put down by the new owners. The pay is found wherever the bed-rock is favorable, but particularly in the large crevices, and occasionally the drifters uncover one that brings to light a clean-up of sluzs and chispas that would take a '49-er back to the palmy days. Something over $600 came out last week, and the day we visited the shaft they were getting the coarse black gold which indicates the right lead. The dirt is raised from these shafts by horse-power, and as the drain tunnel takes out the water at this point, this method is probably the most economical. One thousand ft. below these shafts a new one is being put down, the 15-horse power engine which was used in the Mylert & Hughes shaft having been moved there to do the hoisting and pumping. Under the able management of Mr. Manson, this machinery is now in splendid working order, and a boy 10 years old could perform all the labor required in running it. The shaft is substantially timbered, being down about 50 ft. Bedrock will be reached next week, at the depth of about 75 ft. The drain is considerably above bedrock at this point, and the water from the shaft is pumped into it. So far, the water is light, and there is no indication that it will prove troublesome. From this shaft, when down drifts will be run both east and west, and when the pay channel is uncovered it will be followed. A few hundred ft above and to the left of the shaft is the break from the famous "Cloyd claim," and undoubtedly some very large gold will be found opposite and below that point. If this shaft develops as much good ground as is expected of it, the Co. will put on another engine, near the lower end of the O'Neill ranch, to test the ground at that point and work it if the pay is found. The new Co. evidently proposo to work the ground thoroughly, and in a business-like manner. They are now employing about 25 men, all the miners being under the direction of Mr. W. Meikle, who seems to be thoroughly up in his business. The prospects of the Co. are certainly good, and we hope to see them find the ground even better than they anticipate.

SIERRA.

Gold Bluff.—*Mountain Messenger*, Sept. 24: Last week we visited the Gold Bluff quartz mine, 1 mile above town. Mr. Vansyke, the owner, entertained us hospitably, and showed us through the works. The ledge is about 12 ft wide, and they have raised on it about 70 ft. It is a heavy body of good pay ore between well defined walls. He has a 12-stamp mill running days only. Twelve men are employed about the mine. Since the mill was started, the amount of amalgam taken from the plates each day has averaged about 12½ ozs. Mr. Vansyke is working carefully, and will, if he has no bad luck, make this one of the best mines in this county.

Leffel Turbine.—The Good Hope quartz company has just received a 70-horse power turbine wheel to be used at the 20-stamp mill above town. The work is progressing favorably on the mill.

NEVADA.

WASHOE DISTRICT.

Sierra Nevada.—*Enterprise*, Sept. 25: The east drift joint with Union Con. has been extended 18 ft. On the 1600 level are putting in a discharge pipe for the Union shaft to the Sutro tunnel. On the 2500 level east crosscut No. 1 has been extended 18 ft; crosscut No. 2, 21 ft, and crosscut No. 4, 19 ft. The main north lateral drift has been extended 9 ft.

Union Con.—On the 1600 level a discharge pipe is being put in to the Sutro tunnel from the Union shaft.

Mexican.—The Mexican and Union winze on the 2500 level has been sunk and timbered 8 ft.

Opher.—The joint Mexican east crosscut has been extended 20 ft; total, 120 ft. Repairing the north drift joint with Californus.

California.—The only work being done in this mine is at repairing the north drift on the 2500 level. We expect to have the large suction fan completed to-morrow (Sunday) night.

Con. Virginia.—Work has not yet been resumed in the mine in consequence of the intense heat.

Union Shaft.—Are repairing the 1600 drift to the Sutro tunnel and putting in an extra line of discharge pipe to said tunnel.

Yellow Jacket.—During the past week the north lateral drift on the 3000 level has been extended 38 ft, making the present length of the same 250 ft from the switch. The ground continues hard and dry. The north winze below the 2828 level has been sunk and timbered 27 ft, making the present depth 194 ft on the slope. The bottom is quite hard and dry. The Belcher and Crown Point dump has been started, reducing the quantity of water pumped to about 55 inches. All the machinery of the mine is in good condition and working well.

BARBEE DISTRICT.

Ore.—*Silver State*, Sept. 26: We learn from Alex Wise, who visited Barbee district, in the Humboldt range, last week, that there is considerable ore in sight in one of the mines which is being developed by Judge Barbee. The ledge has been uncovered for quite a distance, showing a strong vein, carrying ore in paying quantities.

BRISTOL DISTRICT.

The Mill.—Pioche *Record*: The Bristol mill started up last Wednesday, for the purpose of experimenting a little with the ore which will be put through raw, and if the returns prove satisfactorily, the mill will be turned into a wet crusher, thus dispensing with the roasting process and enabling the working of twice the quantity of ore that was formerly put through. If such prove a winning venture, the output will foot up between $50,000 and $60,000 per month. An extraordinary showing for a 10-stamp mill. The company has in the Mayflower a mine, which for the grade of ore stands to-day without an equal on the coast. The bottom of the winze on the 240 level is in $150 rock, while the face of the drift going southeast from the same winze, which is 40 ft, shows a 5-ft vein of ore running up in the thousands, with an average of $268 per ton. The mean average of 12 assays taken yesterday by Supt. Ross showing the above result. The mine, the way it stands to-day, is a bonanza well worth its millions, and will undoubtedly be the means of bringing Bristol to the front as one of the leading bullion-producing camps in the State. One boom is always followed by another. We are now at the hight of our mining boom, and as a material consequence, we are to have another one on top of it in the shape of a building boom. There is going to be no less than half a dozen new buildings going up this month for business purpose, and a score or so of dwelling houses. Real estate has already advanced upon the impetus of the late strikes over 100% during the last 20 days, and before snow flies Bristol will be one of the liveliest camps in the State. The Day furnace is now ready to start up. The new boiler has been placed in position, and the necessary connections made. More teams have been put on hauling ore, and from 25 to 30 tons are now coming down daily.

CANDELARIA DISTRICT.

Northern Belle.—*True Fissure*, Sept. 24: The shaft levels are looking about the same as last week, and producing the usual quality of ore. The 10th and 11th levels show fully as well as last reported. The levels above present no material change. The 6th and 6th continue their usual yield, and the development above the 4th is looking well. In other parts of the mine there are no changes worthy of note. There are being extracted and sent to the mills about 80 tons of ore daily. Both mills are running steadily, and doing the usual amount of work. Bullion shipments for the week ending Sept. 21st, $27,161.10. Total shipments on September account to Sept. 21st, $00,648 31.

EUREKA DISTRICT.

Strikes.—*Sentinel*, Sept. 23: Important strikes in the mines of this district are becoming very numerous of late. We have two more to report this morning. Both are very valuable, as well for the future of the district as for their intrinsic merit. The Seventy-Six mine is a short distance above the mouth of New York canyon. Mr. Luther, who has had charge of the property, has devoted the closest attention to the work of development. He has at last cut into a bonanza of considerable magnitude on the lower level of the mine. The drift has penetrated the ore about 6 ft. The ore is on three sides, and in the face of it. Average assays run $200 to the ton. The richness of the find, taken in connection with the seaming extent of the body, gives to it the brightest promise. The Deadbroke mine is owned by Martin Piantoni. It is located near the crest of Prospect mountain adjoining the Banner mine. Mr. Piantoni admits that he has just discovered a splendid body of high-grade ore on his 200 level. We have not been furnished the particulars beyond the bare announcement of the strike. The owner of the property is feeling especially jubilant, and there can be no question but that he has found something pretty big.

GRANTSVILLE DISTRICT.

Alexander.—*Bonanza*, Sept. 24: All work at the mine was continued without interruption during the past week. The chloride stope between No. 4 and 5 levels is opening up fine, and will produce a large amount of ore.

Brooklyn.—In the Brooklyn the west drift, No. 3 level, is now in from crosscut 114 ft, the whole length of same being through vein matter and quartz of a favorable character for striking an ore body soon. The upraise from No. 2 level, which is in chloride, is looking well and producing fine ore.

SAFFORD DISTRICT.

Men.—*Silver State*, Sept. 23: L. L. Rickard has just returned from a flying trip to Safford district, where he has coachee to convey passengers from the railroad to the mines. He says that there are 75 men in the district, and the number is increasing daily. The name of the new town has been definitely agreed upon, and it is to be known as Gerald.

The Outlook.—Cor. Eureka *Sentinel*, Sept. 23: The mining outlook here continues to improve. New strikes and locations are made every day, but little work is being done, except on a few locations. Capital is showing itself every day, but the holders of the most promising claims hold them at such prices as to frighten purchasers. The owners of the Contention are now engaged in sinking a shaft 50 ft deep, with the view of seeing whether or no the rich ore on the surface extends down to any depth. On the Illinois claim, adjoining the Contention, work is being done systematically, which will surely develop well. On the Bull's Head and Belcher ground developments will be made in a short time. In the Belcher, at a depth of 3 ft, a seam of rich ore has been uncovered. On the Sonora and Veida a force of men will be put to work to develop those properties. The Wallace has shown up a well-defined ledge. This claim lies at the base of the big mountain south of the Onondaga, and it is supposed by experts that the vein assumes a contact form there. The Rose, Fannie Ray, Maggie O, St. Julien, Grey Eagle (recent locations), lying south of the Wallace, from samples taken from the croppings, promise to even surpass the older locations in richness. The bonanza of the district will be found in this large mountain. The Amelia and Nettie, located by Joe Fryer of the Albion, will, by a little labor, demonstrate the fact that the great body of ore lies in this mountain. The Rose and Fannie Ray, located by Eurekans, and on top of the ledge, will in a short time develop into real bonanzas. The assays from the croppings will astonish the people.

Jumpers at Safford.—We are informed that some parties at Safford district have been jumping some of the mining claims during the absence of their owners. This is an abominable practice, and ultimately results in defeat, as the law allows locators of mining claims a year to work them after they are located, and once a claim is properly bounded, no power in the land can deprive a locator of his rights. We understand that some Eureka parties are the offenders; hence we would suggest to them that the sooner they quit the practice the better, as it reflects no credit on them. Parties in a new district should respect each other's boundaries, and if some were not fortunate enough to make favorable locations, they should not show their teeth by trespassing on the land of others.

ARIZONA.

Globe District.—*Chronicle*, Sept. 22: The prevailing fine weather and lull in the Indian excitement, has placed mining matters in this district again in a thriving condition, and renewed activity is noticeable in every camp. Reports from Richmond Basin are of a most encouraging nature. The out-put of ore from the Mack Morris is continually increasing, larger and richer bodies are being uncovered, and there is no question but that the company will soon require additional milling capacity. The East Richmond which joins the Mack Morris on the west end is making a splendid showing of ore at the bottom of the shafts as well as in the face of both drifts.

Mineral Creek.—Affairs are very quiet since the Indian excitement, but work is about being resumed with an adequate force. The Mineral creek mill is well guarded by a well-armed and provisioned force, and all is in order to start at short notice.

Little Chief.—Work has been commenced on this property and ore of good class is being taken out. This is a very promising property, the developments having shown a larger body of ore of good quality and high assay value in both gold and silver.

Tombstone.—*Epitaph*, Sept. 25: While there are no marked features to report for the last week there have been no setbacks in the yield of ore, which is ample to keep the mills running up to their fullest capacity. This of itself guarantees a larger bullion output for the month of September than has ever before been recorded of the district.

Tombstone Mine.—Everything is moving along with the customary smoothness. No. 3 gives a daily output of 60 tons. No. 6 is looking very well and turning out the usual amount of ore.

Contention.—They have connected the 400 level between the old and new shafts. In the south drift on the 400 level they have an 8-ft ledge that looks well. Are sinking a winze from the 400 to the 500 level in which the ledge looks equally well as above. On the 500 level the south drift is in 250 ft. On the 600, still cross-cutting, the drift being now 200 ft long, all in ledge matter. The stopes are all looking well and yielding their usual amount of ore, that goes forward to the mill, which is kept running at its fullest capacity. After paying the September dividend of $75,000 they carried a surplus of $83,045 forward to the reserve fund, which shows the affairs of the company to be in a healthy condition.

Grand Central.—Sinking in the main shaft has been resumed. The rock is not quite so soft as above the 200 level, but breaks well, and good headway is being made. The station is complete and is a spacious apartment, being 16x23 ft, and 10 or 12 high, solidly timbered and planked with the best Oregon pine. The machinery works quite as well as expected, and that is to perfection. Work on the ore dump is progressing.

Vinzina.—Sinking the main shaft continues with the most favorable indications of an ore body near at hand. The shaft is down 390 ft. Ore extraction, awaiting a decision on the question of a mill, is limited to 1 load, or 15 tons daily. The various breasts and stopes look quite as well as heretofore, and the ore is of very high grade. Had it not been for the 500 ton limit, the September output would have reached a round $100,000.

Silver Belt.—Cross-cutting continues with favorable indications of ore, the face of the cross-cut being in black spar, quartz and mineralized porphyry, all of them harbingers of ore in this district.

Stonewall.—Shipping ore to the Boston mill was reported last Thursday. Good results may be expected as it is rich in horn silver. Work is not being pushed with great rapidity as one shift of 3 men is able to take out ore in advance of any desire to ship the same.

Girard.—Ground was broken for the mill on Monday morning last, and is progressing rapidly.

Prompter.—The developments are quite flattering, the incline, which is down 140 ft, being all in ore. Two shifts of men are employed.

DAKOTA.

Bald Mountain Carbonates.—Black Hills *Times*, Sept. 23: From every quarter we hear of rich strikes and rumors of strikes. Mr. N. M. Henton and Mr. E. R Adams, the discoverer of the New Era mine, dropped into our sanctum to day and exhibited specimens of ore from the mine which were exceedingly rich. The gentlemen appear sanguine, and, we think with sufficient reason, that they have found a genuine carbonate vein, and furthermore it is not a blanket lode, but a true vertical vein. Rock selected at random has assayed $15 to the ton in silver with a trace of gold. A shaft has been sunk 50 ft. At the depth of 25 ft a cross-cut was made which developed carbonates. After passing through this formation the work was continued 25 ft further, through mineral all the way. The rock they are now in shows free silver in abundance. It is estimated the present ore will go 200 ounces of silver to the ton, and about 70% of lead. The inhabitants of the Bald Mountain district smile audibly when the mineral belt is defined as is now generally understood. They claim that although we are on a mineral belt, and a good one for this section of the country, the mineral belt, the El Dorado of the county, is over their way, as time and a little more work will conclusively show. We certainly have no objection. We think will be

The Black Range, New Mexico.

The New Mexico *Mining World* says: The mines are now accessible by the stage from Eagle depot, some 50 miles south of San Marcial, on the Atchison, Topeka & Santa Fe road. Hearn & McConkey run a six-horse stage to Fairview, and lighter vehicles to Chloride city and Grafton. The latter camp is highly favored by nature. It is well timbered, and sight creeks flow through it, in all of which running water can be found nine months in the year.

Chloride city is the pioneer camp of the range, beautifully located at the mouth of Chloride gulch. The stream of Chloride runs through the town, which has a population of 300 souls. The great drawback to this camp has been the obstinacy of prospectors in holding undeveloped claims at the figures of developed property, and thus repelling capital that would have been invested in the district, owing to the immense lodges and rich assay obtained from the surface croppings. The result of this policy has been to retard the growth of the camp, which would have been very rapid, and to cause a general stagnation of business in Chloride city. The prospectors have now realized the folly of their own policy, and are prepared to sell at reasonable prices.

The Cuchillo Negro range lies three miles southeast of Fairview. Several locations have been made on it. The ore is free-milling, carrying gold, silver and copper. The Know Nothing, owned by E. R. Blackman and E. A. Giles, is a full claim with a 12-ft. shaft and 4 ft. vein, running high in gold, silver and copper.

The Ivanhoe mine is located on Turkey creek, and owned by the Ivanhoe mining company. It is without a doubt the best mine yet discovered in the Black range. The nature of the ore is sulphuret, carrying an unusual quantity of free gold. Gold assays have run as high as $20,000 to the ton. Horn and brittle silver are also found in large quantities. The main shaft is 80 ft. in depth, and the tunnel has been run 190 ft. At the intersection of the shaft and tunnel, the vein is 15 ft. in width. A day and night shift are working, giving employment to 28 men.

Hermosa camp is part of the Black range, located on the Palomas river. The principal property owners are F. L. Wilcox and E. R. Chew. They have 30 claims and are now opening five, while most of the others show good mineral on the surface. The veins have a northeasterly and southwesterly trend, carrying native silver, silver glance, copper and galena.

Mineral city is a small camp started within the past two months, and contains about 30 men. The Dreadnaught, owned by J. N. Smith and others, is the first location on the Dreadnaught lode, which can be traced for eight miles. It is a well-defined fissure vein, and $25,000 has been refused for it.

Dry Creek camp is six miles north of Chloride city, and is extensively located. The most work is done on the Buffman, an open cut to tap the vein. It is 15 ft. in length, and a shaft has been sunk 20 ft. The pay streak is 18 inches wide, and the only wall yet struck is the porphyry. Free gold was found on the surface. The owners are C. Bishop and Wm. Penn. The Colossal and Wood claims, South Fork, are owned by Dr. Wood, J. H. Dorsey and others, and are handsome claims. They are sinking a shaft on the former and sorting ore for shipment to Pueblo. The pay streaks are three in number, the ore running 200 ozs. of silver to the ton, with a trace of gold.

Fairview is a new camp located on the head waters of Cuchillo Negro river. It is the center of a large mining district, and the headquarters of the stage line. The town site is in a large valley abundantly supplied with wood and water. From its central position, being the junction of all the roads that come into the Black Range, it is likely to be the town of that district. Mills and smelters will also be erected here.

The Black Range is fast drawing the attention of capital from the East, and many sales will shortly be made. We make no mistake in ranking it as one of the best and richest mining camps in New Mexico.

Prospecting Copper Mines. — Extensive copper leads have been known to exist in the Pueblo mountains, in the northwestern part of the county, for years. In early days, when the Indians were on the rampage, several prospectors were killed while hunting mines in that section, and for years afterwards little was done there, except to locate some copper mines, which cropped out at various places in the range. Recently J. C. Wear, who procured a United States patent for some of these mines, seven or eight years ago, has been making a move to develop them. He has tested the ore and found that it contains a high percentage of metal, and he is now putting men to work on the property with a view of putting up furnaces when the developments warrant the outlay.—*Silver State.*

Good Gold Mines.—Gold bearing quartz, which promises to pay handsomely, has been discovered by Samuel Crandall and John Beach in New York canyon, near Derby's ranch, in the northwestern part of the county. They took nine tons of the quartz to Bartlett Creek and worked it in a mill at that place. The result was highly satisfactory, the ore having produced $900, or $100 per ton, which was brought here by Mr. Crandall and shipped to San Francisco.—*Silver State.*

Treating Complex Ores in Europe.

The following communication from Mr. Charles W. Bryant, of the Deer Isle mining company, addressed to the *Maine Mining Journal*, is valuable:

It is known to the readers of the *Journal* and many gentlemen who are interested in Maine, that I have recently returned from Europe, where I obtained some information in regard to the treatment there of ores similar to the varieties which are found and being mined in this State. Some of the general details and results of my observations will, I think, be not only interesting to people here, but will, I trust, tend to do away with the feeling prevalent that Maine ores cannot be profitably treated.

The process by which complex ores are being treated at Swansea, at one establishment where about 250 tons per week are worked is as follows:

1. The ore is ground to a coarse powder.

2. The ore is then calcined in muffled furnaces at a moderate heat, to drive off the sulphur, the sulphurous fumes being collected in leaden chambers and towers for the manufacture of sulphuric acid in the usual way.

3. The ore is then placed in a revolving pan (somewhat similar to the mortar mill) containing sulphuric acid diluted with hot water. The diluted sulphuric acid at once takes into solution nearly all the zinc and copper, leaving all the lead and silver undissolved in the ore. The latter is now in a suitable condition for smelting in the usual manner in cupolas or reverberatory furnaces.

4. The solution of zinc and copper is then drawn off into tanks, where any fine particles of the ore settle as a mud, which latter contain lead and silver (being in fact the finer portions of the ore) and is suitable for smelting as above.

5. The copper in solution is then precipitated in the customary way, by iron, forming a copper precipitate, at once suitable for the copper smelters.

6. The remaining liquor, which contains the sulphate of zinc, is then drawn off into pans, and evaporated until it becomes a thick mud, when a certain quantity of raw or uncalcined blende (zinc ore) is added. The desiccation is carried still further until a dry mixture is obtained of sulphate of zinc and raw blende. The blende is added to decompose the sulphate of zinc in the next operation.

7. The mixture is placed in close ovens and there heated to redness. The sulphate of zinc is disengaged (derived from the sulphate of zinc and added blende) and conveyed to leaden chambers for production of sulphuric acid, while the zinc remains in the state of oxide, suited for the production of metallic zinc in the usual manner.

Thus, from this brief description it will be seen that all the metals contained in the ore are utilized, and that the agent used for the purpose (viz., sulphuric acid) is obtained from the ore itself.

The Plumas-Eureka Property.

From a letter in the *Mountain Messenger*, describing the famous Plumas-Eureka mine, we take the following: The mine is located near Jamison creek on the top of a mountain, some 3,000 ft. from or above the creek. The mine is one of the best timbered quartz mines I have seen in the State. The tunnel is 3,400 ft. long. The quartz is drawn out in large iron cars by mules, each car contains 1½ tons of quartz, and five cars are taken out each trip. The lode is from 4 to 20 ft. wide. At the mouth of the tunnel is a large steam hoiler, the steam is forced in through iron pipe, driving two engines in the mine, used for hoisting ore. There is no waste rock, everything is crushed. Their mills are run by water power. A lake is located on the top of the mountain, from which the water is obtained. The company built a new 60 stamp mill, near Johntown, at the foot of the mountain. A tunnel is now running from this mill to the lode, and will tap the lode at least 1,000 ft. lower than it ever has been worked before. The new mill is a model of workmanship, it has 60 stamps, 3 ore breakers, self-feeders, 24 pans and all modern improvements for saving gold. All the machinery is run by a turbine wheel. The mill is managed by a very few men. The company own their own sawmill and sell considerable lumber. At their machine shop nearly everything that can be made for the mine is manufactured here. Their car wheels and rails are all steel, and come from England, and are laid down in San Francisco much cheaper than our own manufacturers would sell them at. Their steel rails only cost a fraction over 3 cts., laid down in San Francisco, duty paid. Thirty arastras are run on sand or tailings that come from the mill, these are run by water power. They are owned by three Italian companies, who pay monthly rent to the Plumas-Eureka Mill company.

Science and Mining.—Prof. E. D. Cope, the celebrated naturalist, owns considerable mining property in New Mexico, and has just been paying a visit to that Territory. Prof. Alexander Agassiz, the eminent scientist, who is President of the Calumet and Hecla Co., is about to visit New Mexico to look after copper mines there, and will make a thorough investigation.

The new 20-stamp mill at the Rising Sun mine at Colfax is completed and put in operation, and everything is running satisfactorily.

Mines of Peru.

The following account, given by Hon. Chas. Adams, United States Minister to Bolivia, of a recent tour of inspection made by him of the silver mines of Bolivia, will be of interest. He says:

The principal mines worked in Bolivia to-day are those of Potosi, which, since the time of the Spaniards, have produced some $3,000,000,000 in silver, and are worked to-day, although in a very primitive manner, without machinery or smelting appliances, to a good profit. The Potosi mines are all located upon one mountain, which is almost cylindrical in shape. The seams and veins of ore cross each other and run through the mountain in almost every direction, and are found in every variety of shape and form. They are different in width as they vary in richness. Originally, too, veracious history tells us, the outcroppings consisted of pure silver, which was quarried and shipped to Spain. That there was some foundation of truth in this is, I think, proved by the quantities of square pieces of natural quarried silver taken from the veins still preserved in the cathedral of Sucre. These pieces I have seen and examined, and therefore know that such veins must have existed, though whether they are not all worked out remains an open question. In appearance the Potosi looks like a huge beehive, so seamed and covered over is it with a perfect honeycomb—I can use no other word for it—of tunnels and shafts. So much is this the case that it is almost, if not absolutely, impossible to travel around it on horseback. Even to-day quite a large number of the inhabitants of the city of Potosi have their own little gopher holes. Into these, they, so to speak, whenever they are in want of money, burrow and take out a sack or two or three or four of decomposed ore, which they heat up with rocks and work in the nearest rivulet for silver, as we do here for gold. Some of the mines are worked by companies. Of these there are four or five. The work is done mainly by tunneling and drifting. As a rule, even these mines are only worked for a few months in the year. As a whole, I should think that for at least one-third of the year they lie idle.

How they Work the Ores.

The ore is worked in much the same manner as it is with us, by stamp mills run by water power, but much more frequently in arastras. After crushing the ore is washed, desulphurized, and after that process thrown into large copper kettles, each of which holds about one ton. Water and quicksilver are then mixed with the mass, which is beaten with sticks by a number of men—six, if I remember, is a full complement—who stand around the big copper kettle, which is hung suspended over a fire. The beating is continued for about 12 hours, until the silver is amalgamated, when the charge is turned out and the kettles again filled, and the same process repeated. However primitive this system may appear to those of us who have seen the perfection to which mining is carried on in this country, it appears to possess the one great essential, that of thoroughly separating the pure silver from the base metal. In fact, the average per cent. saved by this simple process of separation is about 50%.

How the Miners Make it Pay.

Mr. Adams thus describes the manner in which the peons steal the rich ore from the mines in Caluechaca, probably the richest in the world, and by this means manage to keep 30 small smelters running when the mines are in operation:

The peons are not only searched, but stripped every night before leaving the works, so that it is impossible for them to pack off the ore in lumps. The most common way of committing these thefts is to grind the ore into powder while they are in the mines, and throw the powder over their clothing and underclothing. Some of them wear knitted stockings and drawers, and the amount of ore that will stick to these is hardly to be believed. After resuming their clothes at the works, they, on arriving at home, just throw the clothes laden with the dust into a bucket of water, when the dust, being loose, sinks to the bottom and forms a sediment. This sediment is to a very large percentage composed of silver. Another favorite method with some of the more cunning is to take a piece of the gangue rock, hollow it out, and fill it with dust that perhaps has 75% to 80% of silver in it, and plug the rock up and wheel it out with the rest of the gangue rock, and put it then just where they can get it as soon as they leave the works. A favorite method I learned was to hollow out a pick handle and fill that with powdered ore, while some have been known to be so cunning as to have made impromptu suppositories out of the powdered ore and carried it off in this manner.

The demand for miners, says the Salt Lake *Tribune*, is becoming quite active in nearly all the mining districts of Utah. The rise in the price of lead is causing many dormant properties to start up, and will materially increase the product of the Territory.

The most encouraging reports still arrive from the various mining camps in Calico, Grapevine and Alvord districts, San Bernardino. It is asserted that a mill will shortly be erected in the latter district by San Francisco capitalists.

How they Salt a Claim.

"I wish you would explain to me all about this salting of claims that I hear so much about," said a meek-eyed tender-foot to a grizzly old miner who was panning about six ounces of pulverized quartz.

"I don't see what they want to salt a claim for, and I don't understand how they do it."

"Well, you see, a hot season like this they have to salt a claim lots of times to keep it. A fresh claim is good enough for a fresh tender-foot, but the old-timers won't look at anything but a pickled claim. You know what quartz is, probably?"

"No."

"Well, every claim has quartz. Some more and some less. You find out how many quartz there are, and then put in so many pounds of salt to the quart. Wild cat claims require more salt, because the wild cat spoils quicker than anything else.

"Sometimes you catch a sucker, too, and you have to put him in brine pretty plenty or you will lose him. That's one reason why they salt a claim.

"Then, again, you often grub stake a man——"

"But what is grub stake?"

"Well, a grub stake is a stake that the boys hang their grub on so they can carry it. Lots of mining men have been knocked cold by a blow from a grub stake.

"What I wanted to say, though, was this: You will probably at first strike free-milling poverty, with indications of something else. Then you will no doubt sink till you strike hard-rock, or a true fissure gopher hole, with traces of disappointment.

"That's the time to put in your salt. You can shoot it into the shaft with a double-barrelled shot-gun, or wet it and apply it with a whitewash brush. If people turn up their noses at your claim then, and say it is a snide, and that they think there is something rotten in Denmark, you can tell them that they are clear off, and that you have salted your claim, and that you know it is all right."

The last seen of the tenderfoot he was buying a double-barreled shot-gun and 10 lbs. of rock salt.

There's no doubt but a mining camp is the place to send a young man who wants to acquire knowledge and fill his system full of information that will be useful to him as long as he lives.

Silver Reef, Utah.

Recent events warrant us in repeating that the future of Silver Reef was never so full of promise as at present, and it is encouraging to note that those most enthusiastic in foreshadowing the destiny of the camp are the men whose long residence in the district and thorough acquaintance with its resources place their opinions high above the value of ordinary speculations. Silver Reef is in no sense a mushroom camp. It is not supported by money brought in by outsiders. It stands and will continue to stand upon its own solid merits, and is in no need of a stampede to sustain life. In other words, there is nothing Woodriverish about the district. It is a camp whose mines are their own advertisement. They are growing richer and larger with every stroke of the pick, and upon this fact alone do we depend to attract the capital now lying idle awaiting opportunities for investment. The general distrust as to the permanence of ore veins in sandstone has altogether disappeared and it is now conceded that our small surface development has proved far less profitable than future operations will become as greater depth is obtained. Let capital and muscle be brought to operate with system and energy along the line of our great lodes, let the vast area of virgin ground awaiting the magic influence of industry and cash, be made to bring forth its treasures. Legitimate mining is not more uncertain of success than merchandising or manufacturing, and where the rock is sandstone and the mines as easily developed as they are in this district under proper management, the careful investment of capital is absolutely safe.—*Silver Reef Miner.*

Grand Prize.—At the annual meeting of the Grand Prize mine last week, the Secretary submitted a report, which showed a total of receipts and expenditures of $308,445. Of the receipts, $83,600 were from assessments; $15,922 from bullion; and $13,000 from crushing ore. The sum of $28,848 was derived from sale of stock, machinery, rent of mill, hoisting, etc. In the expenditures, the sum of $87,403 was spent for mine labor; $19,046 for mill labor; $94,637 for mine supplies; and $33,056 for mill supplies. The discount on bullion was $22,872. The election for Directors and officers resulted as follows: J. L. Brown, Jno. E. Dixon, Thomas Cole, Thomas Whitely, E. M. Hall. President, J. L. Brown; Vice-President, Jno. E. Dixon; Secretary, E. M. Hall.

William A. Farish has been appointed Superintendent and General Manager in charge of the State Line mines, Gold Mountain, Nev. Mr. Farish, who is now in New York, will be remembered in connection with the Homestake and Black Bear mining companies.

Mohawk is to be the name of the new mining town in Safford district.

The Engineer.

Advantages of Electric Railways.

In an extended account of the construction and working of the Siemens electric railway at Berlin, the London *Times* mentions as first among the advantages which the electric motor has over steam or compressed air for passenger transport, the circumstance that no heavy machinery has to be carried about to set the train in motion. The carriages can therefore be built in a lighter manner, thus reducing the power necessary to move them, and permitting all bridges and superstructures to be built more cheaply than usual. Several carriages, each with a dynamo machine, can be joined to one train, and by this distribution of motive power much steeper inclines can be overcome than when the same train is drawn by a single locomotive. In addition to the ordinary brakes, means can be provided to short-circuit the machines on the carriages and to cause them to act as very powerful brakes. The use of large stationary engines reduces the amount of fuel necessary to develop a certain power on the traveling carriage, and if waterfalls can be utilized the cost of working these railways can be further diminished. It seems probable that such railways can be usefully and economically constructed to facilitate the traffic in crowded streets, or in situations where local circumstances favor their application. From all that has been done during the last few years it is evident that the art of transmitting power by electricity has advanced rapidly, and that its practical application is continually gaining ground.

New Discovery in Marine Architecture. Mention has already been made of a new discovery in marine architecture by Prof. Raoul Pictet of Geneva, who is now constructing a small steamer for a working model. Prof. Pictet expects that a vessel built on the principle which he has devised will draw less and less water as her speed increases, thus gliding over the water instead of pushing through it. The model which he is now building will be 52½ ft. long and 11½ ft. broad. She is expected to draw 13 inches fore and 18 inches aft while lying at anchor, and two-fifths of an inch fore and 6½ inches aft when going at full speed. The engine will be placed amidships, from which point to the stern the screwshaft and the keel form an inclined plane; the bows are long, tapering and wedge-shaped. The inventor expects to effect a great saving of fuel, believing that a steamer built on this plan can be kept at full speed with one-third the expenditure of force with which it started. The trial trip will be made on Lake Geneva next November, and the model is expected to reach a speed of 40 miles an hour. The Geneva correspondent of the London *Times*, who furnishes the above description, writes that Prof. Pictet's previous scientific achievements have been so remarkable that many people who cannot follow his reasoning have no hesitation in accepting his conclusions.

The *Livadia*, from which so much was expected, and which gave such promising results at first, is, it seems, greatly disappointing its projectors, and the present Czar is having a lamentable experience with the great "turtle-back" yacht, built for his father in England in accordance with specifications which defied all established rules and precedents, and gorgeously equipped for the royal pleasure. A dispatch from Odessa to the London *Times* says: "It is reported that the commission appointed to examine the qualities of the Russian imperial yacht *Livadia*, has come to the conclusion that she does not satisfactorily answer the requirements of a sea-going vessel, either in a nautical or a mechanical sense, as she rolls too much, is too slow, too weakly built, and the materials used in her construction are of inferior quality. It is, therefore, suggested to take the yacht to pieces and build a gunboat and three cruisers out of the materials, and use the fittings and furniture for a third yacht to be built on the lines of the original *Livadia*." We have never heard that the formidable French ram *Dunderberg*, built in America by Wm. H. Webb, of New York, was "weakly built," or deficient either in "a nautical or a mechanical sense."

The Mississippi Jetties.—Conflicting accounts reach us in regard to the working of the Mississippi jetties. At one time, reports come that they are more than meeting the most sanguine expectations; then again, accounts like the following are sent out: It is not unlikely, judging by some reports, that Capt. Eads will be called upon by Congress at its next session to explain the condition of the jetty system at the mouth of the Mississippi river. The Government has now expended upwards of $5,000,000 upon it. Two years ago Capt Eads drew a large sum of money from the public treasury on the strength of his statement that the ship channel was 600 ft. wide and 30 ft. deep. Last month an English steamer dragged the bottom of the channel for 150 to 200 yards, while drawing only 23 ft. of water. Four captains of as many different crafts also certify that instead of the channel being 600 ft. in width, it is apparently not more than 150 ft. wide, and that they believe that just above Cram island two vessels drawing 23 ft. of water could not pass each other without liability to grounding.

Useful Information.

Magnets for Dressing Ores.

The *Engineering and Mining Journal* is of the opinion that the indications are multiplying that magnets will in the future occupy a more prominent position in the dressing of ores, and it seems that some of the most troublesome ore mixtures that have heretofore baffled the skill of the mining engineer will become tractable with their aid. There is nothing new in this proposition to take advantage of the fact that one mineral is attracted by the magnet, while another that is associated with it is not, to separate them. The same paper says that at Traversalla the method was used at an early date, and it has since been tried at Przibram and other places. But it is really only since the perfection of dynamo-electric machines that this promising field has been fairly opened. The use of light, powerful electro-magnets in the place of ponderous permanent magnets has increased the capacity of such machines, and made them practical. It would of course be idle to expect any magnetic dressing apparatus to do what Edison at one time claimed it to be able to accomplish in working tailings; and a study of the plans recently brought forward by Siemens, and the apparatus now used at the Friedrichsegen mine, Prussia, will be sufficient to convince an engineer that the "great wizard," late of Menlo Park, New Jersey, has not kept abreast of the time. The Siemens separator consists of a series of rings, made magnetic by the current from a dynamo-electric machine, and so arranged that one end of the drum, where the ore is first delivered, has less power, which increases as the material is carried toward the delivery. The Friedrichsegen apparatus, which is now used for separating blende and spathic iron ore after it has been roasted, has a number of fixed electro-magnets massed near the point where the ore is fed. The material falls upon a rotating copper drum, within which these electro-magnets are, and the adhering particles of iron ore carried along by the drum, while the blende glides by the magnets. A judicious system of roasting, if necessary, and separation by magnetism, will probably prove a valuable aid in the treatment of such ores like intimate mixtures of blende and pyrites, or some of our New Jersey zinc ores.

Burning Gold into China.—To dissolve gold for gilding china or glass that has to be burnt: Triturate gold leaf in a mortar with a little honey until reduced very fine; then dissolve out the honey with hot water, and mix the gold dust with a little gum water for use; or dissolve the gold in hot aqua regia, evaporate to dryness in a porcelain dish over a hot water bath, and dissolve in ether for use.

A Simple Method for Obtaining Ozone.—Put a few sticks of clean phosphorus in a basin of water, half cover them with fresh cold water (soft), and put a closed bell jar or inverted glass vessel (clean) of any kind over all so as to confine the air above the phosphorus. In the course of an hour the air thus confined will be found charged with ozone.

A Brilliant Black is produced on iron and steel by applying, with a fine hair brush, a mixture of turpentine and sulphur boiled together. When the turpentine evaporates there remains on the metal a thin layer of sulphur, which unites closely with the iron when heated for a time over a spirit or gas flame. This varnish protects the metal perfectly, and is quite durable.

To Harden Steel take two teaspoonfuls of water, one-half teaspoonful of flour, and one of salt. Heat the steel enough to coat it with the paste by immersing it in the composition; after which heat it to a cherry red and plunge it into soft water. If properly done, the steel will come out with a beautiful white surface. Strike files are said to be hardened in this manner.

To Keep Machinery from Rusting take one-half ounce of camphor, dissolve in one pound of melted lard; take off the scum and mix in as much fine black lead as will give it an iron color. Clean the machinery and smear with this mixture. After 24 hours rub clean with a soft linen cloth. It will keep clean for months under ordinary circumstances.

A Recent Drill Press made by an English firm has the column carrying the platen at one side of the frame, so that the platen can be swung out entirely clear of the frame, leaving nothing between it and the work, which is bolted on the main bed-plate under the platen. This is of cast iron, planed true, and must be a great convenience in drilling cylinder flanges, etc.

English Steel Castings by some firms are made from old files in connection with other material, and are said to be sound and very strong. It is said that the excess of carbon in such stock is found no disadvantage.

To Remove Ink-Stains or to Bleach Wood. Oxalic acid dissolved in warm water and applied to the parts stained will remove the stain, or bleach wood that is too dark to match any other part.

The "White House" Wash.

A correspondent in the *Scientific American* says: "I have noticed in several answers to correspondents and in at least one article in your valued paper an allusion to what they call the whitewash on the White House. As I know something of that preparation I think it proper that I inform you and your many readers. About the year 1836, John Ogden Dey, Esq., an unternal uncle of mine, visited Washington. He was a man of very observant habits, and, in his inspection of the White House and the old Capitol building (the central part of the Capitol as it now stands), he found that the stone of which it was erected was being acted on severely by the weather. The outside of the stones had splintered by exposure and contraction and the disintegrating effect of the atmosphere to such an extent as to seriously threaten its permanency. He sought the Committee on Public Buildings and proposed to remedy the evil, not with stucco, but with a cement wash. After a full interchange of opinion, he was empowered to send the material and instructions to Washington, which he did; and it was put on the next year, and has stayed there ever since, protecting the building material effectually. The information was given without fee or reward.

"The old man has passed away long since, and, in justice to his memory, as well as to inform the public, I have penned this. The material used was "Onondaga Hydraulic Cement," from the State of New York, mixed with a small amount of glue and with milk; the exact proportions I do not now remember. I have seen several brick houses covered with this cement that have stood all kinds of weather for years. Some I have in mind were washed 35 years ago, and still retain the full coat and look as well as when put on. The cement has to be applied soon after it is mixed, and put on as thick as the brush will carry it. Sometimes two or more coats are required."

New Use for Petroleum.—In the town of Beku, in the Russian petroleum district, the crude oil is worth but six cents a barrel and the authorities use it for "watering" the streets in preference to sea water, though the latter costs only the hauling. The oil in combination with the sandy soil makes a solid and compact pavement which lasts for many days. Nothing is said about the prevailing odor in Beku.

Good Health.

A Study of Children's Teeth.

For two or three years Dr. Samuel Sexton has been engaged in an investigation of the teeth of school-children with special reference to the influence of decayed teeth upon the sight and hearing of children so afflicted. The investigation was suggested by the almost constant occurrence of defective teeth in cases of inflammatory diseases of the eye and ear.

In the course of his work, the *Times* states, Dr. Sexton has taken some hundreds of accurate casts, in plaster, of the interior of the mouth in cases that have come under his notice, and has collected a cabinet that is invaluable as a contribution to science. His method has been, first, to take a complete cast of the internal cavity, and then from it to mould each jaw separately, and unite the two posteriorly with a neat brass hinge, so that the state of the teeth, their arrangement, and all their peculiarities can be observed at a glance. He has found a pretty constant association between impaired hearing and defective teeth, the cause of which he believes to lie in the distribution of the fifth pair of nerves, which is at once a sensory, motor and trophic pair, supplying the teeth, the tissues of the nose, those of the eye and ear, the integuments of the frontal and temporal region, and so on. Irritation of the whole region is consequently produced by a defective tooth, and, in point of fact, some of the severest cases of neuralgia, temporal, facial and ophthalmic, arise from impaired teeth; often in cases where the teeth themselves give no trouble whatever, and none save the acutest medical intelligence can trace any relation between the fierce attacks in the eye, ear or temple, perhaps, and the carried tooth that gives no local trouble whatever. In a few cases progressive dementia has been arrested by immediate repair of a tooth that produced no apparent disturbance, but was responsible for deep-seated cerebral trouble; but these cases have been too few to lay stress upon as factors in the investigation. On the other hand, troubles with the eye and ear are often traceable to defective teeth, and Dr. Sexton regards irritation of the maxillary limbs of the fifth pair as among the principal causes of the progressive near-sightedness of school children, as observed by Drs. Agnew, Loring, Parke Lewis, Roha and other ophthalmologists.

A New Way of Coloring the Hair.—Dr. D. W. Prentiss, of Washington, reports to the Smithsonian Institute that he recently gave a little girl of that city jaborandi, a Brazilian plant, as a cure for blood poisoning. He was much surprised to find that her hair, which was at first a light blonde, soon began to turn dark, and watched with much interest the darkening process for four months, when it was almost black. He believes that the change was due to the medicine which he administered during that time for the child's blood.

The Hygiene of Old Age.

At no period of life is a careful observance of the laws of health of so imperious importance as in advanced age. The vital machinery is worn and weakened, the vitality at low ebb, and it is of paramount importance that all unnecessary hindrances should be removed, that every removable obstacle to the healthy performance of the bodily functions should be taken out of the way. Thousands of lives are annually sacrificed through the mistaken idea that hygienic rules which are acknowledged to apply to young persons and adults are not to be observed by those in advanced age. For example, many popular writers maintain that while the use of wine as a beverage by youth and adults cannot be condemned too strongly, it is necessary for the aged, as a means of stimulating the declining forces.

Another writer condemns bathing by the aged because, it is claimed, it uses up the animal heat.

The error of the first theory is apparent when the fact is recalled that stimulating lessens, instead of reinforcing, vital strength, thus weakening the hold on life and shortening its duration. The fallacy of the second theory is equally apparent when we take into consideration the fact that in old age the wastes of the body are greatly increased. The discharges from all the outlets of the body are more heavily laden with organic impurities than during youth and adult age. The breath is laden with the poisonous products of disintegration, and the perspiration with effete matter. It is for this reason that a sudden obstruction of any of these outlets is so speedily followed by fatal results. If frequent bathing is neglected, the skin becomes obstructed and the kidneys are overworked. The urine becomes irritating in character, and inflammation or congestion of the bladder is likely to be the result. We have met scores of cases of irritable bladder in elderly men which could be traced, in a great part, at least, to the neglect of the bath.

Old persons should recollect, also, that the bath is for them particularly necessary as a sanitary measure. As the waste of the body propoundsrates over the repair, the skin, if unwashed, soon becomes covered with a film of the most intensely poisonous and readily decomposable matter. A few days' accumulation is enough to produce a condition not only in the highest degree detrimental to the individual himself, but offensively injurious to all persons of acute olfactory sensibilities who may be closely associated with him.

It is true that cold bathing may be, and generally is, in a high degree injurious to aged persons; but bathing in water at or near the temperature of the body cannot be more productive of harm than putting on a clean suit of clothes. Cleanliness is enforced by one of the first laws in the "code of health," and is binding at all times, and at all ages. The greatest enemy of health is dirt; and the worst of all kinds of dirt is that which arises from the destructive processes at work in the body.—*Good Health.*

Danger from Dust.

A probably serious source of disease is the dust of cities. When we reflect that this is the dried and pulverized dirt and filth of our streets, derived from all kinds of refuse matter, its dangerous qualities may be suspected if they are not clearly obvious. Conveyed by the winds, it is diffused everywhere, and settles upon or adheres to everything. We inhale it, drink it, and eat it with our food. A speck of mud on our bread excites disgust; but who minds the same thing when it is nothing but a little dust? If our food just brought from the market or the provision store is examined with the microscope, it is found to teem with small particles of dust, consisting of fine sand, bits of hay and straw, filaments of cotton from old paper and rags, wood fibres, hairs and scurf scales of man and beast, starch grains, spores, etc. Recent investigations render it probable that dust contains the germs of decomposition, gangrene, and contagious diseases.

While our view of the dangerous qualities of dust may be exaggerated, there is certainly sufficient reason to regard it with apprehension, and make it desirable to avoid it. Its subtle and all-pervading character renders this, to a great extent, impossible, but it may be much reduced by the removal of its sources of supply—the accumulation of dirt and filth. For this reason the streets should be kept clean, by sweeping and washing; and, to facilitate this, they should be as smoothly paved as will be consistent with safe walking and driving. Especially is this desirable in the vicinity of the depots of our provisions, the market houses, where, unfortunately, we often observe the greatest accumulation of dirt. The streets around our markets should have an asphaltum or other smooth pavement, and it should be swept and washed weekly, or oftener.—*American Journal of Microscopy.*

Bone Felon.—The London *Lancet* gives the following recipe for the cure of this most excruciatingly painful affliction: As soon as the disease is felt, put on directly over the spot a fly-blister, about the size of your thumb nail. Let it remain for six hours, at the expiration of which time, directly under the surface of the blister, may be seen the felon, which can be instantly taken out with the point of a needle or a lancet.

MINING AND SCIENTIFIC PRESS.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—New Vertical Wheel; Tombstone District, Arizona; Miners to be held for Damages; The Day Mining Company, 217; Passing Events; Quartz Mining about Hornitos, Mariposa Co; Canada Hill Mining District, Placer Co.; Some Problems Arising in the Assay Office; A Reminiscence; Chrome Iron in Placer Co., 224-25; The Drainage Act Unconstitutional, 225-28.

ILLUSTRATIONS.—Leffel's New Vertical Mining Wheel, 217. The Old Overland Route—A Camp on the Plains, 225.

CORRESPONDENCE.—Mining Projects in London; Sights and Sounds on the Columbia, 218.

MECHANICAL PROGRESS.—Possibilities of Cast Iron; Small Steel Castings; 'Iron Sponge" for Gas Purification—A New Industry; Novel Driving Belts, 219.

SCIENTIFIC PROGRESS.—The Study of Thunder Storms; New Electric Property of Selenium; Tracking Storms Across the Atlantic; A Large Collection of Spiders; The Electric Candle in Vacuum; The Action of Oxygen on Mercury; Spectra of Fire Flies; Green and Red Lights in Vegetation, 219.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Assessments, Meeting and Dividends, 220.

MINING SUMMARY from the various counties of California, Nevada, Oregon, Arizona, Dakota, Montana, New Mexico and Utah, 220-21.

MISCELLANEOUS.—How to Buy Mines, 218. Antiquity of Trade Marks, 219. The Black Range, New Mexico; Trusting Complex Ores in Europe; The Plumas-Eureka Property; Mines of Peru; How they Salt Claims; Silver Reef, Utah, 222.

THE ENGINEER.—Advantages of Electric Railways; New Discovery in Marine Architecture; The Mississippi Jetties, 223.

USEFUL INFORMATION.—Magnets for Dressing Ores; Burning Gold into Chius; A Simple Method for Obtaining Ozone; The "White House" Wash; New Use for Petroleum, 223.

GOOD HEALTH.—A Study of Children's Teeth; A New Way of Coloring the Hair; The Hygiene of Old Age; Danger from Dust, 223.

NEWS IN BRIEF on page 228, and other pages.

Busineee Announcemente.

Chemical Stoneware—R. C. Remmey, Philadelphia, Pa.
Assessment Notice—Newcastle M. Co., S. F.
Delinquent Notice—Oxford Beta M. Co., S. F.
Water Wheel—Almarin B. Paul, S. F.
To Quartz Prospectors—Almarin B. Paul, S. F.

Passing Events.

For the past few days the obsequiee of the President have occupied the public mind so greatly, that our mining news is unusually meager Nevertheless, from various quartere come notes of encouragement and progress. Several very rich strikes are reported.

The most important newe of any, however, to California miners, is that the "Drainage Act" haa heen declared unconetitutional. This matter is referred to more fully elsewhere in this issue.

The week has been filled with mourning and the heart of the people has overflowed with sadness. It is remarked that such universal and unfeigned grief at the death of a ruler, is not within the memory of any one. There have good and great men died before, and died too at the hand of violence, calculated to excite the fullest indignation and sympathy. But none has died so profoundly mourned. The truth of the matter is that not for a generation perhaps has our people been so closely united in heart, sympathy and aspiration. The old issuee were long since hnried, and the animosities they engendered have melted away in the warmth of the new and stronger union. Thue when the assasein lifted his hand at the President, he struck at the whole people, and there ie hut a eingle sentiment of hereavement pervading the nation.

The public demonstrations at tho obsequies of the late President were greater than have ever been known before. On Monday, at Clevsland, Ohio, where the intsrment took place, there was every possible token of respect, esteem and remembrance. At the sams hour, from end to end of the country, memorial services wers held. In San Francisco, the procession of military and civic societies was two and ons-half honrs passing a point, and appropriats services were held in the great pavilion of the Mechanics' Institute, which only a fraction of ths great multitude could enter. Everything has tended to maks ths incidents of ths past three months doubly impressive upon the minds of ths people, and their lessons will not soon he forgotten.

Quartz Mining About Hornitos, Mariposa County.

Hornitos, one of the oldest mining camps in Mariposa county, shows signs of returning activity. Many old quartz claims are heing prospected again and new locations are heing made. Tbe Duncan quartz mine a mile southeast of the town has heen bought hy San Francisco parties who are putting up a 10-stamp mill on the propsrty. The mine has only bsen worked a few feet below the water lsvcl and so far has proved very rich. Rich developments ars expected as soon as sinking is resumed. The Washington mine is taking out considerable rich ore, hnt running its mill on short time owing to lack of water. The absence of watcr is the weak point of the district; none of the mines within 10 miles of Hornitos, with the exception of tbe Duncan, having watsr enough, even hy using the supply over several times to feed the boilers and batteries. The Eureka mine, originally Qnartz Mountain, is also heing developed. This mine has one of the largest ore hodies of any mins in California, the croppings showing a width of 300 ft. for a distance of 1,000 ft. A new shaft 60 ft. deep has heen sunk on the east wall and work is at present being done on a crosscut to determiue the sxtent of the ore body. Assays made of the rock (croppings) range from $90 in the hest streaks down to an average of from $4 to $10 in the poorer. The owners have had sn engineering party locating a 10-mile line of railroad from the mine to a mill site on the Merced river. The road is estimated to cost about $80,000 equipped. The construction of this road and 100-stamp mill, promised next spring, will give a great impetus to quartz mining in the vicinity, in fact, is its only chance.

Canada Hill Mining District, Placer County.

Reed's hydranlic mine, the longest worked in the district, is heing refitted for hydraulicing the coming spring. Another old claim, the Wiley, has heen extensively worked during the last few years and has paid well. On Hill's mine a bedrock tunnel hae heen run 400 ft. toward an unprospected part of the channel. The Oriental company have ennk a prospect shaft in the cement 80 ft. to hed-rock and drift ing from it found ground warranting the running of a hedrock tunnel next season. Several new locations on which more or less work has heen done have heen made this summer and nearly every foot of possibly valuable ground has heen taken up.

All of these mines are on what is known as the Canada hill channel which is at an elevation of about 7,000 ft. and contrary to the ordinary course of the huried river chaunels of the Sierras, rnne from west to east. The gold is a coarse quartz gold very little washed and often connected with ite original qnartz matrix. The eources from which thie quartz comee are evidently ledges in the immediate vicinity. Several of these ledges have heen prospected and yield well. More thorough prospecting and a little energetic work propsrly hacked up with capital will, heyond question, establish a paying quartz dietrict.

Lower down on the Divide at the Secret House the Greek claim is heing fitted up for extensive drifting. Buildings, gravel chutes, car tracks and sluicee are in course of construction. The hedrock tunnel has developed a large channel and extensive deposit of pay gravel. The Hogs Back and New Basel mines, owing to litigation, are not heing worked at present.

FAITH.—A miner named Piantone hae just made a rich strike in Eureka district, having found a splendid body of high grade ore in the "Deadhroke mine," on Prospect mountain. The *Sentinel* says: "No man is hetter deserving of the greateet euccess. Mr. Piantone has always heen imhued with the etrongest faith in the value of Prospect mountain mines and has demonstrated this faith hy his works. He has heen sticking to the old mountain for the past eight years. He discovered and developed the Matamoras mine for which he received $50,000. He now thinks that the Deadhroke is even more valuahle than the Matamoras."

J. E. TIFFON, of Redding, Shasta county, exhibited at the State fair a tire upsetter of novel construction and design, hut which proved itself capahle of performing ite work in a very satiefactory manner.

On Some Problems Arising in the Assay Office.

[Written for the MINING AND SCIENTIFIC PRESS hy C. H. AARON.]

To Find the Weight of Gold in a Specimen of Gold in Quartz, etc.

The rules for this operation, as given in most hooks, involve a great deal of work, and are snch as no one hut a Chinaman can vsnture to trust his memory with. I bave therefore trisd to find a method which, if not simpler, will at least involvs the use of fewer figures and he more easily remembered. Of ths following nine rules, some appear to fulfil these conditions.

Rule 1st. From the product of ths specific gravity of the specimen multiplisd by the specific gravity of the gold, snhtract the product of the specific gravity of the qnartz multiplied hy the specific gravity of the gold. The rsmainder divide hy the difference hetween the specific gravity of the gold and that of the quartz. The result will hs the parts of gold in as many parts of the specimen as equal the specific gravity of the specimen. Example: A specimen weighs 32 ozs., its specific gravity is 8. Taking the specific gravity of gold equals 19, and that of quartz equals 2.6 then

$$8\times19=152$$
$$2.6\times19=49.4$$

$19-2.6=16.4$ | 102.6 | $=6.256$ ozs.

of gold in 8 ozs. of the specimen, and 8:6.256 ::32:25.024 ozs. of gold in the specimsn. In this case, as $8=\frac{1}{4}$ of 32, it is only nscessary to multiply 6.256 by 4. Assuming the specifio gravity of gold and gangue as ahove, the rule may he stated thus: Multiply specific gravity of specimen hy 19; subtract 49.4 and divide the remainder hy 16.4. The qnotient is ths nnmher of parts of gold in as many parts of the specimen as equal specific gravity of specimen. The constants can he altsred to suit any given specific gravity of metal and of gangue, and a note of thsm kept at hand rsady for nse.

Rule 2d. From tho product of spscific gravity of specimen into specific gravity of gold, subtract the prodnct of specific gravity of specimen into specific gravity of quartz for a divisor, and from the same subtract the product of specific gravity of quartz into specific gravity of gold for a dividend. Divide, and multiply the quotient by the weight of the specimen. The product will bs the weight of ths gold in the specimsn.

Example, same as before:

$8\times19=152$ $\qquad$ $152.$
$8\times2.6=20.8$ $\qquad$ $19\times2.6=49.4.$

Divisor, 131.2; Dividend, 102.6; Quotisnt, 0.782, which, multiplied hy 32=25.02 oz. of gold in the specimen.

Rnle 3d. Subtract specific gravity of specimen from specific gravity of gold; the remainder call volume ratio of quartz.

Substract epecific gravity of quartz from epecific gravity of specimen; the remainder call volume ratio of gold. Multiply volume ratio of quartz hy specific gravity of quartz, the product is the weight ratio of the qnartz; multiply volume ratio of gold hy specific gravity of gold, the product is tbe weight ratio of the gold. The sum of these is the corresponding weight ratio of the specimen.

Divide the actual weigbt of tbe specimen, hy proportion, in the ratio found.

Example, the same.

$19-8=11=$volume ratio quartz.
$8-2.6=5.4=$ " " gold.
$11\times2.6=28.6=$ weight ratio quartz.
$5.4\times19=102.6=$ " " gold.
$102.6+28.6=131.2=$ " " epecimen.

and 131.2:102.6::32:25.024 ozs. of gold in the epecimen.

Rule 4th. From specific gravity of gold × specific gravity of specimen subtract epecific gravity of gold × specific gravity of qnartz, and from the latter subtract specific gravity of quartz × specific gravity of specimen. The firet remainder is the ratio weight of gold; the second is the ratio weight of quartz. Example, the same:

$19\times8=152$ $\qquad$ 49.4
$19\times2.6=49.4$ $\qquad$ $2.6\times8=20.8$

Ratio of gold .102.6 $\qquad$ Ratio of quartz .28.6

The rest of tho calculation is the same as in rule third.

The rule may he more easily remembered if stated thus: Proceed as in redncing to a common denominator the fractions representing the displacemeut of the substances in water, namely: $\frac{19}{1}$ $\frac{2.6}{1}$ $\frac{8}{1}$, so far as to obtain the new numeratore, the common denominator not heing required; then, from the greatest numerator subtract the next less, and from that the least. The first remainder is the ratio weigbt of the gold; the second that of the quartz. In this example the new numerators are: $\frac{20.8}{\cdots}$, $\frac{152}{\cdots}$ and $\frac{49.4}{\cdots}$, as found above.

Rule 5th. Divide any nnmher hy the specific gravity of the gold, the quartz, and the epecimen respectively. From the greater quotient subtract the next less, and from that the least. The firet remainder is the ratio weight of the gold in the epecimen. The second is that of the quartz. Any number will do for a dividend, hut the most convenient is the specific gravity of tho gold, giving 1 for tbe least quotient. Example, the same:

$19\div19=1$	$7.3-2.37=4.93=$ ratio of gold.
$19\div2.6=7.3$	$2.37-1=1.37=$ " quartz.
$19\div8=2.37$	

$6.30=$ " specimen.

tbsn 6.30:4.93::32:25.03 ozs. of gold in ths specimen; ths slight discrepancy in this result, as compared with the othsrs, is owing to not carrying the division of 19 to mors decimal placss.

Rule 6th. Multiply specific gravity of specimen hy the difference bstwesn specific gravity of gold and specific gravity of quartz. Also multiply specific gravity of gold hy ths differencs hetwsen specific gravity of specimsn and specific gravity of quartz. Divide the last product hy the first, and multiply hy ths weight of the specimen. The resnlt is the weight of gold in the specimen. Taking the same example:

$19-2.6=16.4$ | $8-2.6=5.4$
$16.4\times8=131.2$ | $5.4\times19=102.6$
$102.6\div131.2=0.782$
$0.782\times32=25.02$ ozs. of gold in the specimsn.

As, in any oass the specimsn must be weighed in air and in water, and as the specific gravity of tho mstal and ths gangue may vary considsrahly in different specimens, some lahor may hs saved, and the weight of any mstal or other substance in any gangue found hy procesdiug as follows:

Rule 7th. Weigh the specimen, a portion of the metal, and a portion of the gangue, each in air and in water. Divide the difference hetween the respective weights in air and in water hy ths weights in air. From the greater quotient subtract the next less, and from the latter the least. The first remainder is the weight ratio of the heavier substanes, ths second is that of the lighter. Examplo: A specimen of native silver in calc spar weighs 84 lbs. avoirdupois in air, aud 73.5 lbs. in water. A piecs of the silver weighs 27 (ozs., grains or anything) in air, and 24 in water. A pisce of the spar weighs 20 in air and 12 in water; thsn,

Spar in air 20
Spar in water 12

Dif. $8\div20=0.400$

Specimsn in air 84
Specimen in water 73.5

Dif. $10.5\div84=0.125$

Silver in air 27
Silver in water 24

Dif. $3\div27=0.111$ and

$400-125=275=$proportion of silver.
$125-111=14=$proportion of spar.

289 proportion of specimen.

289:275::84:79.93 lbs. of silver in specimens, and $79.93\times14.583=1165.62$ oz. Troy.

When a body is weighed in air and in watsr, the weight in air dividsd hy the difference is the specific gravity; the difference divided hy the weight is the *specific displacement*. The specific gravity represents the relative weights of equal volumes of the snbstance and of water, when that of the water is called 1. Tho specific dieplacement represents the relative weighte of equal volumes of the same when the weight of the substance is called 1. The specific displacement is the reciprocal of the specific gravity.

The fundsmental eqnation of our problem is generally given as $\frac{x}{a}+\frac{y}{b}=\frac{d}{o}$ in which x, y and d are the respective weights of gold, quartz and specimen, and a, b, c, are the specific gravities. Thie means that the water displaced by the gold, plus that dieplaced hy the quartz, is equal to that displaced hy the epecimen, whence specific displacement of x pins specific dieplacement of y equal epecifio displacement of specimen.

Now specific gravity of gold minus specific gravity of specimen, and specific gravity of epecimen minus specific gravity of quartz, are the relative *volumes* of gold and quartz, from which the relative weights can he deduced; hut specific displacement of quartz minus specific dieplacement of specimen, and epecific displacement of specimen minus specific displacement of gold, are the relative *weights* at once; and if the substances are weighed in air and in watsr, it is as easy to find the spscific displacement as the epecific gravity. Hence Rnle 7th. The specific displacement of any substance heavier than water is always less than nnity; consequently, when all of the eubstances are heavier than water, the decimal point may be dieregarded in that rule.

Or more readily:

$$.0526x+.3846y=4$$
$$.0526x+.0526y=1.682$$
$$.3320y=2.318$$

And $2.318\div.332=6.98$ oz. qnartz.

Then $.3846x+.3846y=12.307$
And $.0526x+.3846y=4.000$
$.3320x=8.307$

And $8.307\div.332=25.02$ oz. gold.

If the specific displacement of the gold or of the quartz he not determined experimentally, either can he got hy dividing 1 hy the assumed spscific gravity. Thus, in the example of the silver epecimen, the specific gravity of the spar is $20\div8=2.5$; the specific displacement is $8\div20=.4$; whicl is the same as $1\div2.5$; hence, when the specific gravity of each component and of the epscimen are given, the correspondiug specifio displacement for each may he found by dividing 1 hyeach specific gravity; hut the

proportional specific displacement can be got by dividing *any* number by each specific gravity; hence, Rule 5th.

Again:

Let x = weight of heavier substance, a its s. d.
y = " lighter " b its s. d.
c = " specimen, d its s. d.
or total displacement = difference of weight in air and water.

Then $x+y=c$
And $ax+by=d$

Whence I deduce the following:

Rule 8th: From the product of weight of specimen into specific displacement of lighter substance, subtract total displacement of specimen. From total displacement of specimen subtract the product of weight of specimen into specific displacement of heavier substance. Divide each remainder by the difference between specific displacement of lighter and specific displacement of heavier substance. The first quotient is the weight of the heavier, the second of the lighter substance in the specimen.

Taking our first example:

Specific displacement of quartz equal .3846; specific displacement of gold equal .0526; total displacement of specimen equal 4; weight equal 32.

$.3846 \times 32 = 12.307$
$12.307 - 4 = 8.307$ first remainder
$8.307 \div .332 = 25.02$ oz. gold
And $4 - 1.683 = 2.317$ second remainder
$2.317 \div .332 = 6.98$ oz. quartz

And again, if the specific gravity of the components be given, or assumed, it is not necessary to change anything, nor to obtain specific gravity of the specimen; for, let specific gravity of gold $= a$; specific gravity of quartz $= b$; weight of specimen $= c$; and its difference of weight in air and water $= d$; and let x = weight of gold, and y = weight of quartz in the specimen. Then,

$x = (ac - abd) \div a - b$, and
$y = (abd - bc) \div a - b$, whence

Rule 9th: Weigh the specimen in air and in water, and note the difference.

From the product of specific gravity of gold multiplied by weight of specimen in air, subtract the product of specific gravity of gold, multiplied by specific gravity of quartz, multiplied by difference of weight of specimen in air and water. The remainder, divided by the difference between specific gravity of gold and specific gravity of quartz, is the weight of the gold.

From the subtrahend above subtract the product of specific gravity of quartz, multiplied by weight of specimen in air. The remainder, divided by the above divisor, is the weight of the quartz. Taking our first example again:

$19 \times 32 = 608$
$19 \times 2.6 \times 4 = 197.6$

$19 - 2.6 = 16.4 \mid 410.4 \mid 25.0244$ ozs. of gold.
And 197.6
$2.6 \times 32 = 83.2$

$16.4 \mid 114.4 \mid 6.9756$ ozs. of quartz.

This rule is easy to work and saves labor. It is, however, less easy to remember than some of the preceding.

When accuracy is desired, as in buying gold specimens with gangue, it is quite important that the *relative* specific gravities, or the displacements, should be obtained, and as it is only necessary that they should be correct relatively, any liquid at any temperature will answer for the determination.

In the first example, reckoning the gold at $20 per oz. the value is $500.40. Had the specific gravity of the specimen been taken as 8.1, the value would have been $502 80. With 8.2 as the specific gravity it is $506.60, and with 9 it is $520 approximately.

An error in the specific gravity of the gold is not compensated by the greater quantity found. In the example referred to, 18.5 specific gravity would give 25.17 oz. of gold in the specimen, but the value would be only about $488.

To mix acid and water, or strong and weak acids, to any strength below the maximum.

Rule—From the density, by Beaume's hydrometer, or specific gravity of the stronger acid, subtract the required density, or specific gravity; the remainder equals the required proportional volume of the weaker acid or water. From the required density or specific gravity, subtract the density or specific gravity of the weaker acid or water, the remainder equals the required volume of strong acid. Measure in the proportion thus found, and mix.

Example—It is required to dilute nitric acid of 54° B. to 32° B.

$54 - 32 = 22$ = proportional volume of water.
$32 - 0 = 32$ = " " " acid.

Again—Required to mix acid of 53° B. with acid of 28° B. to make acid of 32° B.

$53 - 32 = 21$ volumes of strong acid.
$32 - 21 = 11$ " " weak "

The rule will not apply to the dilution of sulphuric acid, because the density of a mixture of sulphuric acid and water is above the mean. I have, however, found it serviceable in preparing nitric acid for parting.

To Convert Degree Beaume Into Specific Gravity.

Divide 145 by 145 minus the number of degrees Beaume, the quotient is the specific gravity.

Example: I have nitric acid of 47° Beaume, what is its specific gravity?

$145 - 47 = 98$ and $145 \div 98 = 1.48$ specific gravity.

To Convert Specific Gravity Into Degrees Beaume.

Divide 145 by specific gravity and subtract the quotient from 145, the remainder is the number of degrees Beaume corresponding to the specific gravity.

Example: I have sulphuric acid of 1.71 specific gravity, what is how many degrees Beaume?

$145 \div 1.71 = 84.8$ and $145 - 84.8 = 60°$ Beaume.

I have taken this rule from an article in the *Chemical News*, in which the matter is thoroughly discussed. It appears that there is a good deal of disagreement between various Beaume hydrometers, and Beaume died without leaving any rules regarding them. Hence the results of the above rule do not quite agree with those of some authorities.

It may seem superfluous to give rules for so simple an operation as the rectification of the normal solution of salt used in the humid assay of silver bullion, yet I have seen students a good deal puzzled over it, and so I venture to offer the following simple rule without explanation:

1st. If the solution is too weak, that is, if it gives too high a result in an assay of test silver:

Multiply the whole quantity of salt which was used in making the solution, by the number of points that the test assay is too high, and divide by 1000. The quotient is the quantity of salt required to be added to the normal solution.

Example: The solution was made with 650 grains of salt. A test assay gives the fineness of pure silver as .1007, or 7 points too high; then $650 \times 7 = 4550$, which, divided by 1000, gives 4.55 grains of salt required to be added to the solution to make it standard.

When dry salt is used in making the rectification, it should not be put at once into the large vessel containing the solution, but should be first dissolved in a smaller vessel, using not water, but some of the normal solution for the purpose. The dish or beaker used may afterwards be washed with a very little water, and the washings added to the solution. The small quantity of water thus added will tend to correct a slight error which might otherwise arise from the fact that a little of the original solution was consumed in making the test assay.

The rule applies equally to the saturated solution of salt used by some assayers for making the normal solution. It may not be mathematically accurate in all cases; that depends upon the cause of the discrepancy, as whether it arises from incorrect measurement of the water in making the solution, or from error in weighing the salt, or from impurity of the salt, but it is practically correct.

Second. If the solution is too strong, that is it gives the result of a test assay too low. Multiply the whole quantity of water which was used or intended to be used in making the solution, by the number of points that the test assay is too low, and divide by 1,000. The quotient is the quantity of water to be added to the normal solution. A correction for the percentage of solution consumed in the test may be made, but it is not worth while, unless only a very small quantity has been prepared. As the discrepancy in this case is almost certain to have been caused by erroneous measurement of the water, the rule may be considered rigidly correct.

To Convert Degree of Fahrenheit's Thermometer into Degree Centigrade

The zero of Fahrenheit is the temperature of snow and salt, which was once supposed to be the lowest possible. The zero of Centigrade is the freezing point of water, or 32° Fahrenheit. Hence, all temperatures above 32° Fahrenheit are plus, or above zero Centigrade; and all below 32° Fahr. are minus, or below zero Centigrade. From the freezing point to the boiling point is 180° on the Fahrenheit scale; on the Centigrade it is 100°. Now, 100 is $\frac{5}{9}$ of 180; hence, to convert degrees F. into the corresponding degrees C., we must multiply by 5 and divide by 9. Zero C. being 32° F., we must observe the following rules:

For temperatures above 32°, subtract 32, multiply the remainder by 5 and divide by 9. The quotient is plus Centigrade. For temperatures below 32°, subtract the number of degrees from 32, multiply by 5 and divide by 9; the result is minus C. For temperatures below zero F., add 32, multiply by 5 and divide by 9; the quotient is minus C. To state it briefly:

Multiply degrees above or below 32 by 5, and divide by 9, remembering that if the degree Fahrenheit is above 32, the corresponding degree Centigrade is +, but if below, −.

Example—Convert 45° F. into C.; $45 - 32 = 13$ and $13 \times 5 = 65$, then $65 \div 9 = 7.22°$ C.

As 45 is more than 32 it is plus, although the sign need not be prefixed, being understood. But, convert 28° F. into C.; $32 - 28 = 4$, and $4 \times 5 \div 9 = 2.22$, and because 28 is less than 32, the sign is $-2.22°$ C. Convert $-17°$ F. into C.; $17 + 32 = 49$, and $49 \times 5 \div 9 = -27.22°$ C.

To Convert Degrees Centigrade into Degrees Fahrenheit.

If above zero, multiply by 9, divide by 5, and add 32. The sign is +.

Example: Convert 24° C. into F.

$24 \times 9 = 216$, and $216 \div 5 = 43.2$, and $43.2 + 32 = 75.2°$ F.

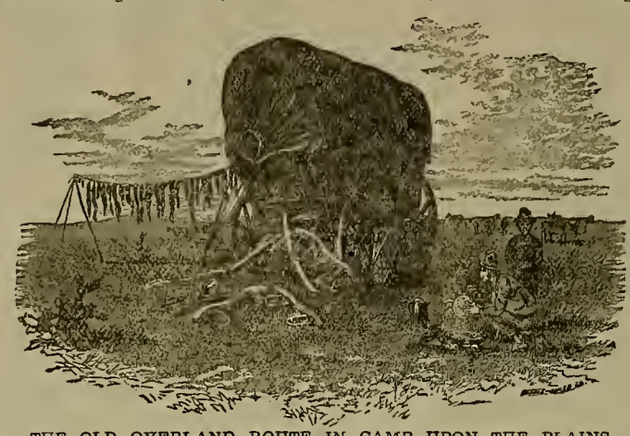
If below zero, multiply by 9, and divide by 5, and if the result is more than 32, subtract 32, and the sign is minus; but if less, subtract from 32, and prefix the plus sign.

Example: Convert $-52°$ C. into F.

$52 \times 9 = 468$, and $468 \div 5 = 93.6$; then, as it is more than 32, subtract that number, and $-93.6 - 32 = -61.6°$ F. Again: Convert $-6°$ C. into F. $6 \times 9 = 54$, and $54 \div 5 = 10.8$, which, being less than 32, must be subtracted therefrom, leaving 21.2° Fahrenheit, which is plus.

A Reminiscence.

Now that the railroads are racing westward, and the whole expanse of the central regions bids fair to be gridironed with the tracks, it is worth while to remember for a moment the method of crossing the plains, which brought many of our older readers to this coast. The prairie schooner, as a pioneer of civilization, is a theme which will engage the attention of the historian, for its service in the development of the country is well defined. It will be hard for those who crossed the plains in the early days, and have not since retraced their steps, to realize the change which has come over many of the solitary scenes through which they passed. The herds of buffaloes have given place to the herds of cattle which supply the Eastern markets; the timid antelope has been superseded by great flocks of sheep; trees, farm-houses and cultivated fields are changeing the lonely wastes into agricultural regions, whose aggregate products are reaching high figures, and are yet but at the beginning. It is wonderful, passing the belief almost, of those who saw the plains in their recent wildness, that so great progress should have been achieved in so short a time. And the end is not yet. It is probable that the next quarter of a century will far outstrip the last in the peopling and subjugation of the wild west.



THE OLD OVERLAND ROUTE—IN CAMP UPON THE PLAINS.

Chrome Iron in Placer County.

Some two years since chrome iron was discovered about seven miles east of Iowa Hill. The first attempt to commercially utilize it has been made this year, 100 tons having been shipped to San Francisco. The ore, which is of excellent quality, is found in irregular disconnected masses imbedded in the country rock and varying in weight from a few pounds to several hundred tons. On the largest mass yet found a shaft 20 ft. deep has been sunk and does not pass through the deposit. It is expected that the prospecting now going on will develop a large and continuous ore body.

Nearly all the hydraulic mines of Placer county are fitting up preparatory to the water season. The threatened injunction by the authorities of Sacramento county has delayed work on the Iowa Hill divide, some of the miners waiting for a decision by the Courts.

For conducting the suits against the hydraulic miners of Sacramento county, the Supervisors of that county, or rather four out of the seven of them, have voted to George Cadwalder the sum of $12,000, as follows, to wit: The $3,000 allowed to him already under resolution of June 28th; the second payment of $3,000 shall be paid on the first Monday in January, 1882; the third payment of $3,000 shall be paid on the first Monday in July, 1882, and the last payment on the termination of the litigation.

It is now said that Oakland will soon have rolling mill.

The Drainage Act Unconstitutional.

The great case known as the Slickens case (People vs. Parks) has been decided by the Supreme Court and the judgment of the Superior Court of Sacramento county, from which Court the case was appealed, has been reversed.

The opinion considers the constitutionality of the Act of April 23, 1880, entitled, "An Act to Promote Drainage," and declares it to be unconstitutional on account of its contravention of Section 24 of Article IV. of the Constitution, which requires that every act shall embrace but one subject, which shall be expressed in its title.

The leading opinion is by Justice McKee, concurred in by Chief Justice Morrison. We are unable to give the decision in full owing to its length, but condense as follows:

The question presented for consideration in this case involves the constitutionality of an act of the Legislature, passed April 23, 1880. It is contended that the act is unconstitutional and void, and is no law, because it contravenes Section 24 of Article IV. of the Constitution, which requires that every act shall embrace but one subject, which shall be expressed in its title. In the consideration of such a question, it is a cardinal rule that nothing but a clear violation of the Constitution will justify a court in overruling the Legislative will. Every statute is presumed to be constitutional, and every intendment is in favor of its validity. When a statute is challenged as in conflict with the fundamental law, a clear and substantial conflict must be found to exist to justify its condemnation, but when found, courts must not hesitate to condemn.

The Sovereign Capacity of the People.

The Constitution is the voice of the people in their sovereign capacity, and it must be heeded. When it speaks in plain language with reference to a particular matter, it must have effect as the paramount law of the land. According to the Constitutional requirement for the enactment of statutory law, the title of every bill introduced into the Legislature must denote the subject of legislation, and when the Legislative bill on that subject has assumed the form of law, its provisions must correspond with the subject of which the title is the name, standing for and representing it. The title of the act under consideration fairly indicates but one subject. As expressed in the title, the whole object of legislation is "to promote drainage." Anyone, after reading the title, would naturally expect to find in the body of the act provisions for carrying that into effect as the whole object of the law, because such provisions, in view of the constitutional provisions referred to, would be necessary to give unity and wholeness to the law. Looking beyond the title to the provisions embodied in the act under consideration, it will be found that they embrace more than one subject, and the question is whether all of them fall within, or anyone of them falls without, the subject expressed in the title. By Sec. 1 a Board of Drainage Commissioners is appointed to divide the State into several drainage districts, and to establish the boundaries thereof, and to organize each district for the purpose of carrying into effect the following objects, viz: "The control of debris from mining and other operations, the improvement and rectification of river channels, and the erection of embankments or dykes necessary for the protection of lands, towns or cities from inundation."

Officers and Powers of District Boards.

Of the Board thus established, the Governor of the State was appointed President, and to him, as Governor, was given power to appoint within ten days after the organization of any drainage district, three persons resident of the district to act as a Board of Directors for the district, each of whom was to receive a salary of $100 per month, and to hold office for four years, and until his successor was appointed and qualified. To each of such Boards was given power to appoint a Secretary and a district and resident engineer and to fix their salaries; to determine upon, with the aid of the State Engineer, a system or plan of works to be constructed in its district; to agree upon and adopt plans for such works; to award contracts for the construction of the same, upon the basis that no Chinese shall be directly or indirectly employed upon them, etc. Each Board was employed to raise money, in exercise of the powers of assessment and taxation, by levying a tax upon all the property of the district, to the extent of one-twentieth of one per cent. on the value of the taxable property therein, and an assessment upon all the hydraulic mines and all the mines washing earth or ores with water, of one-half of one per cent. for each miners' inch of water of each 24 hours' run used during the year; and upon all swamp and overflowed lands in the district, to the extent of not exceeding $3 per acre. In addition to which, provision was made for the levying of a State tax in the year 1880, and each year thereafter, of one-twentieth of one per cent. on all the taxable property in the State. All these assessments and taxes were made collectable and payable as State and county taxes.

The Scope of the Drainage Act.

But the moneys thus raised were to be used "exclusively for the construction of dams for

At the SANBORN WAGON DEPOT,
24 and 26 Beale Street, S. F. Cal.

Three sizes of THOROUGH-BRACE WAGONS, with 1, 2 or 3 seats. Eight sizes of EXPRESS AND DELIVERY WAGONS. Three sizes of FOUR SPRING WAGONS, with 1, 2 or 3 seats. Besides Business Wagons and Buggies.

Also, all sizes of FARM WAGONS, made by Mitchell, Lewis & Co., of Racine, Wis., who make the best Farm Wagons in the world. All our Wagons are fully warranted. A. W. SANBORN & CO.,

THE O'HARRA
CHLORIDIZING FURNACE.
Patented in 1878.

SIDE ELEVATION OF THE O'HARRA FURNACE.

This Furnace is Constructed with two SEPARATE HEARTHS, one for DESULPHURIZING and one for CHLORIDIZING the Ore.

BOTH PROCESSES ARE PERFORMED AT ONE OPERATION.

—o—

An endless chain carrying conveyors or scrapers passes continuously through over both hearths, going one way through one chamber and the other through the other chamber. By this means the ore is fed and discharged at the same end of the furnace.

A cheap Furnace to build and to run.

The process is essentially the same as the well-known Freiberg process; but the mechanical devices applied to the furnace and the peculiarity of its construction enable the inventor to thoroughly desulphurize and chloridize the ore to a higher percentage than other furnaces, and with less cost for fuel and labor.

At Washoe and Ophir Tailings Mill it costs $1.10 per ton to work 40 tons in 24 hours.

At the Exchequer Mill, Alpine County, 20 tons are worked in 24 hours, at a cost of $2.61½.

Lewis Chalmers, of the Isabella O. & S. M. Co., Silver Mountain, Alpine Co., says: The O'Harra Furnace did all that is represented in the MINING AND SCIENTIFIC PRESS, roasting and chloridizing at the figures there given, antimonial and arsenual sulphurate of silver up to from 84% to 95% of the assay.

COMPOUND OXYGEN
NOT A DRUG

A NEW TREATMENT for Consumption, Asthma, Bronchitis, Catarrh, Dyspepsia, Headache, Debility, Neuralgia, Rheumatism, and all Chronic and Nervous Disorders.

ACTS DIRECTLY upon the great nervous and organic centres, and cures by a natural process of revitalization.

HAS EFFECTED REMARKABLE CURES, which are attracting wide attention.

HAS BEEN USED BY Rt. Rev. John J. Keane, Bishop of Richmond, Va., Hon. Wm. D. Kelley, T. S. Arthur, and others, who have been largely benefited, and to whom we refer by permission.

IS STRONGLY ENDORSED: "We have the most unequivocal testimony to its curative power from many persons of high character and intelligence."—*Lutheran Observer.* "The cures which have been obtained by this new treatment seem more like miracles than cases of natural healing."—*Arthur's Home Magazine.* "There is no doubt as to the genuineness and positive results of this treatment."—*Boston Journal of Commerce.*

THE OXYGEN HOME TREATMENT contains two months' supply, with inhaling apparatus and full directions for use.

SENT FREE: a Treatise on Compound Oxygen, giving the history of this new discovery and a large record of most remarkable cures. Write for it. Address

ADMINISTERED BY INHALATION. Drs. STARKEY & PALEN, 1109 and 1111 Girard St., Philadelphia, Pa.

Depository on Pacific Coast.

WE HAVE ESTABLISHED A DEPOSITORY OF OUR COMPOUND OXYGEN HOME TREATMENT at San Francisco, Cal. This will enable patients on the Pacific Coast to obtain it without the heavy express charges which accrue on packages sent from Eastern States.

All orders directed to H. E. MATHEWS, 606 Montgomery street, San Francisco, Cal., will be filled on the same terms on which we fill orders sent directly to our office in Philadelphia.

Patients ordering from our depository in San Francisco, should, at the same time, write to us, and give a statement of their case, in order than we may send such advice and direction in the use of the Treatment as their special disease may seem to require.

DRS. STARKEY & PALEN, Nos. 1109 and 1111 Girard Street, Philadelphia, Pa.

ENGINE LATHES IN SECTIONS.

Limit of weight for 25-inch Lathes, 300 pounds. For 17-inch Lathes, 200 pounds.

THESE LATHES ARE SIMPLE, STRONG, DURABLE AND ESPECIALLY SUITED FOR USE AT MINES.

Patent Agency.

[ESTABLISHED 1860.]

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other Agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 202 Sansome St., S. F.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

MOREY & SPERRY,
MANUFACTURERS OF
Gold and Silver Grinding and Amalgamating Machinery

HOWLAND'S PULVERIZER Takes the Place of the Cumbersome Stamp Mill and can be put up in one day ready for work.

IT HAS BEEN FULLY PROVED AND TESTED.

It weighs complete, 7,000 pounds. It costs $1,500 ready for the belt. Will crush one ton per hour of hard quartz that will pass through a 40-mesh screen. The wear is less than in the stamp mill. Its wearing parts are plain castings and can be dropped into position in a few moments, as shown by the letters A, B and C, no bolts or keys are required; it can be set upon the floor of a mill with no expense for foundations, and can be used to crush and work in charges or continuous. It will amalgamate either gold or silver ores, making a simple, cheap and effective mill. It requires twelve-horse power.

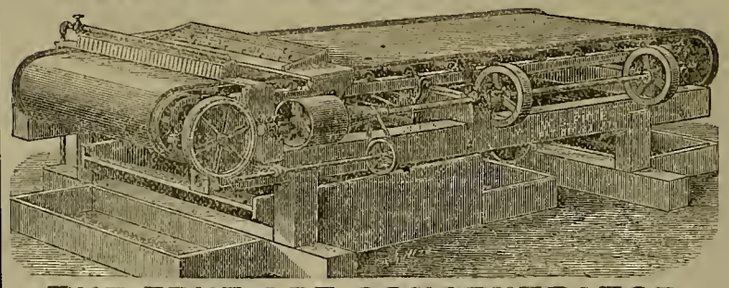
Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores Chloridizing Furnaces, Retorts, Rock Drills Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies Iron Work complete for Wood Frames, also

SPERRY'S WROUGHT IRON FRAME FOR STAMP MILLS.

☞Great saving in time and money over the Wood Frame. It is made complete with Wrought Iron Frame ready to put upon the foundation. We construct Mills with Stamps weighing from 350 to 900 pounds for Gold and Silver Ores Wet or Dry Crushing Mortars.

MOREY & SPERRY—Warerooms, 92 and 94 Liberty St., N. Y.

$1,000 CHALLENGE!

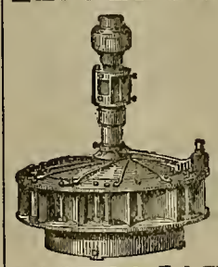


THE FRUE ORE CONCENTRATOR.

Nearly 300 are now in use, giving entire satisfaction. Awarded First Premium and Silver Medal at the Industrial Fair for 1880 of the Mechanics' Institute of San Francisco, Cal.
Saves from 50 to 100 per cent. more than any other Concentrator in use, and concentrations are clean from the first working. The wear and tear are merely nominal; water required is less than in any other wet Concentrator; the power required per machine is less than one-half horse power; the labor required is light, one man on a watch can attend to sixteen machines.
We challenge any other Concentrator in use for a fair and impartial competitive trial, side by side, for stakes of $1,000 each, and we mean business.
☞A machine with all improvements can be seen in working order and ready to make tests, at the office of Hinckley, Spiers & Hayes, 220 Fremont street.

ADAMS & CARTER, Agents, Room 7 No. 109 California Street, S. F.

LEFFEL'S IMPROVED WATER WHEEL.



PRICES REDUCED!
PATENTS REISSUED 1868.
The "OLD RELIABLE" with improvements, making it
THE MOST PERFECT TURBINE NOW IN USE.

Comprising the **Largest** and the **Smallest** Wheels, under both the **Highest** and **Lowest** head used in this country. Our new illustrated Book sent free to those owning water power.
Those improving water power should not fail to write us for **New Prices**, before buying elsewhere. New Shops and New Machinery are provided for making this Wheel. Address

JAMES LEFFEL & CO., Springfield, Ohio,
and 110 Liberty St., N. Y. City.

PARKE & LACY, Sole Agents, 21 and 23 Fremont St., S. F.

GIANT POWDER
MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS.
Nos. ONE, TWO and THREE.
Stronger, Better and Safer than any other High Explosive
Judson Powder
IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.
It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,
SAN FRANCISCO, CAL.

SELBY SMELTING and LEAD CO.,
416 Montgomery St., San Francisco.

Gold and Silver Refinery And Assay Office.

HIGHEST PRICES PAID FOR
Gold, Silver and Lead Ores and Sulphurets.

Manufacturers of Bluestone.
ALSO, LEAD PIPE, SHEET LEAD, SHOT, ETC.

This Company has the best facilities on the Coast for working
GOLD, SILVER and LEAD
IN THEIR VARIOUS FORMS.

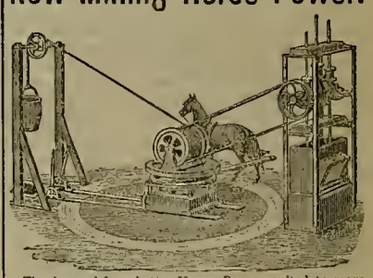
New Mining Horse Power.



The demand for a better Horse Power, suited to more general use, has resulted after much experience in the above machine, which we can recommend as a First-class Hoisting Power, under complete control of man tending bucket, through levers connecting with brake and clutch.
This power is light and strong, so that two or more horses can be used for crushing ore or other work.

PATENT DETACHABLE TOOTH SAWS,
Manufactory, 17 & 19 Fremont St., S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

GRAIN SEPARATOR.—James Root, Black's Station, Cal. Dated, Sept. 20, 1881. No. 247,274. The operation of this machine is in the main similar to implements of this class. The action of the fan blower is the same, and the passage of the stuff through the sieves and final separation of the cheat from the wheat and discharge of the latter present generally no new features. The particular combination, however, contributes to an improved result.

MACHINE FOR MORTISING DOORS FOR LOCKS.—T. N. Andrews, S. F., dated Sept. 20, 1881. No. 247,149. This boring machine for mortise locks consists in a mechanism for simultaneously actuating a series of augers or bits to bore the holes in the edge of the door, and a means for firmly securing the machine to the door, whereby a mortise may be fastened on a door already hung. Both hands are left free to operate the machine. Means are also provided for withdrawing the augers by reversing the cranks.

EXCAVATOR FOR EMBANKING MACHINE.—John G. Dawes, Fresno, Cal. Dated Sept. 20, 1881. No. 247,176. This invention relates to the class of excavating and embanking machines, and it consists of a peculiarly formed revolving cylinder provided with spiral or screw flanges on its several sections, extending from end to end inside, said flanges forming a continual spiral flange through the cylinder, the cylinder having attached to itself, and receiving the earth from, a plow on one side, and being adapted to be added to and extended as the width of the excavation demands.

TRICYCLE.—Henry C. Bridgman, Milpitas. Dated Sept. 20, 1881. No. 247,156. This improvement in tricycles consists of a peculiar frame, the end of which is supported by a steering or guiding wheel, and the forward end by two large wheels, which are propelled by cranks operated by the hands, the seat hung or placed as to render this possible. The steering is accomplished by the feet, which are fitted to stirrups connected with the guiding wheel by means of cords, and operated in the same way racing boats are guided. The novelty in the invention consists in so journaling the large driving wheels so as to be independent of each other, so that each can be operated separately to turn corners and in adapting them to be revolved by hand.

ORE FURNACE.—Ottakar Hofmann, Pinal, Arizona. Dated Sept. 20, 1881. No. 247,193. Mr. Hofmann's improvement in ore roasting furnaces consists essentially in combining with a revolving cylinder furnace two fireplaces, one at each end, and connecting to it with the furnace, and also with the escape flue. Suitable dampers are fitted between each fireplace and the escape flue, so that when a fire is built in one fireplace, its damper may be closed and the flame directed through the furnace and its flue to the chimney. After the ore at the end of the cylinder nearest the first fireplace is properly roasted and chloridized, a fire is built in the other fireplace, and the first one suffered to go down. The damper of the first one is opened while that of the second is closed, so that the direction of the heat is changed and the ore nearest the second fireplace is subjected to the highest temperature. This enables the inventor to chloridize the ore quickly without exposing that at one end to an injurious temperature in order to heat that at the opposite end to a sufficient temperature. Mr. Guido Kustel 318 Pine street, in this city, can give further information about this furnace to those desiring it.

GOVERNOR FOR STEAM ENGINES.—Lee W. Andrews, Live Oak, Sutter Co., Cal. No. 247,235. Dated September 20, 1881. This new mechanism for governing the admission of steam to engines, consists of a two-part cylindrical valve reciprocating in a cylinder, the two parts having two stems passing through them with collars which prevent the parts from separating beyond a certain point. A spring of sufficient strength to keep the two parts pressed against the collars is inserted between them. One of the stems is suitably connected with an operating crank or eccentric upon the engine shaft, and the other is connected with a crank arm upon a balance-wheel, which has a coiled spring and operator like the balance of a watch. This spring is set to a tension which causes it to vibrate in unison with the reciprocating movements of the valve and engine; but its resistance to any increase in speed will retard the forward movement of the leading part of the two-part valve, diminishing the open space between the valves, thereby cutting off steam. If the speed of the engine should decrease, the momentum of the valve will cause it to retard the leading part of the valve, thereby allowing the valves to be kept open by the spring, which tends to separate them and allow a greater admission of steam to the engine.

The Drainage Act Unconstitutional.

(CONTINUED FROM PAGE 225.)

imponnding the debris from the mines hereinbefore specified, and for the improvement and rectification of river channels, in which said debris flows, within the drainage district to be formed under the provisions of this act, at such points as shall be designated by the State Engineer, or deemed necessary by the Board of Directors of such drainage district." It will thus be seen that the body and scope of the act include a combination of subjects. Nor are all the subjects of the act such as would naturally fall within the subject of its title. The storage of debris "from mining and other operations" seems to be the paramount object of this act; to promote drainage the subordinate. What the phrase "other operations" may mean is not clear from the act itself. Under it may be concealed many subjects which are not expressed in the title, and the existence of such a phrase in a statute renders it obnoxious to the constitutional provision under consideration. But the storage of debris, and the promotion of the drainage of a district of country, are things essentially different. The storage of debris is, in its nature, a private enterprise in which the few are only interested. The drainage of a State is a public purpose, in which the public may be interested. To promote a public purpose by a tax levy upon the property in the State is within the power of the Legislature; but the Legislature has no power to impose taxes for the benefit of individuals connected with a private enterprise, even though the private enterprise might benefit the local public in a remote or collateral way. Legislative power of taxation is not illimitable. "Taxation is a mode of raising revenue for public purposes. When it is prostituted to objects in no way connected with the public interest or welfare, it ceases to be taxation and becomes plunder."

Declarations to Public Purposes.

At least these two heterogeneous subjects are embraced in the act, one of which is not expressed in the title, and they cannot be segregated. The title does not express the objects or legislation embodied in the provisions of the act. It is, therefore, narrower than the body of the act, and fails to impart that notice of measures enacted which the constitution requires. To prohibit such legislation was the sole end and aim of the constitutional requirement. Moreover, the Legislature has not in any of the provisions of the act, designated any particular river, stream or locality within the State where drainage is necessary. To declare a public purpose, and to create a district over a designated area of the State in which that purpose shall be accomplished, and to provide ways and means for its accomplishment, are matters which belong exclusively to the Legislature. Furthermore, the act is unconstitutional, because it authorizes a local board to levy a tax and two assessments for a public purpose, at the same time, upon the same property, in addition to a tax levied by the State for the same purpose upon all the property of the State, which, of course, includes the property within the district. Duplicate or triplicate taxation levied at the same time, and for the same purpose, and upon the same property, within a territory of the State which has not been established by the Legislature as a special taxing district, is void, whether levied according to the standard valuation or benefits. Such taxation is destructive of that equality and uniformity which the Constitution requires for the validity of every tax. Judgment reversed.

Concurrent Opinions.

Justice Ross's opinion, concurred in by Justice Thornton, concurs with the foregoing. It says there is no power anywhere to compel the Boards of District Directors to establish any particular district or districts, for the act has left the determination of those questions to their judgment and discretion. This it could not constitutionally do. The establishment of such districts is a legislative function, to be exercised by a legislative body, and the Legislature is expressly prohibited by the Constitution of the State from clothing any of its executive officers with such power. Numerous other objections are made to the act, which need not be determined, since the one just considered is fatal to it.

Justice Myrick also filed a concurring opinion, which says: The act is obnoxious to the Constitution, in that part of it discussed, in the opinion of Mr. Justice Ross and the opinion of Mr. Justice McKee. It may be very much doubted if by the so-called Drainage Act even its probable meaning and intent is expressed, viz: In speaking of the formation of districts it says: "Each of which shall include a territory drained by one natural system of drainage." It does not say that each district shall include all the territory drained by one system, but that the territory included within the district shall be drained by one system; a distinction leaving open a wide door for the creation of an almost unlimited number of districts. Therefore, and for the reasons given upon this subject by Mr. Justice McKee and Mr. Justice Ross, I concur in the judgment.

Justice McKinstry's concurring opinion says: So far as the tax on all the lands in the district is concerned, it may, under the act, be required to be paid before the work is completed or commenced. But if this were not so, the defect is in the law itself, which cannot be held to be good, because, by possibility, all the money raised in the State at large, and from the three modes of taxation applicable within a district, may be expended by the Board of Directors of that district.

The Dissenting Opinion.

Justice Sharpstein dissents. In his opinion he says: The conclusion at which I have arrived is that if all those provisions of the act which contemplate the raising of funds by taxing or assessing any property other than that of the entire State should be held to be unconstitutional, the defendants could not be ousted from office, nor enjoined from letting contracts, nor in this action from levying a tax within the district specified; and if the act is constitutional to the extent which I think it to be, it is quite clear that this Court cannot hold that said district has not been legally formed. It not being clear to my mind that those provisions of the act which affect the people of the entire State are unconstitutional, I think that the judgment of the court below should be affirmed.

Congressman Berry on Hydraulic Mining.

Congressman Berry, of the Third California District, gives his views as follows, through the Sutter *Farmer*, on the subject of hydraulic mining:

1. That it is apparent that if hydraulic mining continues in the future as in the past, the navigation of our rivers and of the bay of San Francisco must ultimately be destroyed, and the greater portion of the Sacramento valley rendered uninhabitable.

2. It is my opinion that no remedial measures will be effectual to prevent this result if that system of mining continues.

3. That all remedial measures that can be applied will be necessary to take care of the material already in the rivers and drainage ways, together with that which will find its way into them from other mining, and the abrasion of the mountains from other causes.

4. Whatever may be the cost of remedial measures rendered necessary by reason of mining in the past, I believe should be paid by the National Government or the State or both.

5. I believe that the law when laid down by the courts will prohibit hydraulic mining, as well as the use of any property by one party or individual when such use results in the destruction of, or injury to, the property of another.

6. Inasmuch as it is evident, and is acknowledged, that hydraulic mining has and is resulting in the destruction of and injury to the property of others, I believe it should be restrained until the right to so mine is determined.

7. As the peace and prosperity of our State will be greatly promoted by the settlement of this question, I believe it is the duty of every citizen to lend his influence to consummate that end.

PRACTICAL RECEIPTS AND PROCESSES.—Mr. A Roman, well known as a bookseller and publisher in this city, has again established himself in his old business at 120 Sutter street. He now makes a specialty of technical and standard works, and encyclopedias. Among the latter which he now has, is "Dick's Encyclopedia of Practical Receipts and Processes," containing 6,422 receipts, embracing thorough information, in plain language, applicable to almost every industrial and domestic requirement. Mr. Roman tells us that the utmost care has been bestowed on this work, to make it exact and reliable, and to this end most of the receipts have been tested to prove their value. Minute directions are given relative to the substances required, their proper proportions, how to prepare, mix and apply them. An important feature is also that the book points out and explains tests for proving the purity, strength, etc., of the article to be used. In fact, the work is a condensed form or comprehensive book of reference for almost every receipt and formula that may be required in the industrial arts, professions, trades and manufactures, medicine, and the ordinary occupations of daily life. The receipts are all classified, and a copious index renders them available for immediate reference. We have not seen so useful a work for many a day. It is complete in one royal octavo volume, bound in cloth, and costs $5.

RICH FIND AT SPRING CITY.—Authentic reports of an important strike in the Live Yankee mine at Spring city, have been received at Winnemucca. The *Silver State* says the ledge is said to be over six ft. wide, and the ore will average over $300 to the ton. Nicholas Frayer, generally known as "Big Nick," has been at work on the claim for several months, and at last his labor has been rewarded by striking a body of ore which will make him independently rich. The Live Yankee is located south of the Bullion of Paradise, and adjoins that mine on the same lead. The owner has extracted a car-load of ore in a few days which it is estimated will yield $300 to the ton.

THE doors of the National Bank of Luxemburg were closed by the Government on Monday. The notes of the bank will no longer be accepted at the public treasuries. The bank is obliged to go into liquidation.

News in Brief.

THERE is now no smallpox in The Dalles.

THE Mrs. Garfield fund amounts to $317,000.

ALL four saw mills on Coos bay are now at work.

DEER are reported scarce in the mountains of Siskiyou.

GUITEAU'S trial is not expected to begin before December.

THE new hospital at San Diego will soon be completed.

THE Klamath Indians have raised 20,000 bushels of wheat this year.

THIRTY thousand cords of firewood are piled at Crystal bay, Lake Bigler.

THE arrival of emigrants at Castle Gardon since January 1st foot up 328,000.

RIVERSIDE proposes to donate $100,000 toward building the California Southern railroad.

THE Indian troubles in Arizona have been ended by the surrender of nearly all of the hostiles.

THE upper Salmon creek mill, Mendocino county, shuts down at the end of this month for want of shipping facilities.

THE Sanitary Commission has received a telegram from Djiddah, Arabia, announcing that cholera has broken out among the pilgrims at Mecca.

UP to the 20th of this month, 41 schooners have arrived and departed from Westport, Mendocino, ladened with ties, posts, bark, lumber, etc.

MESSRS. HALL & COLLINS, of Haywards, have completed clearing 22 acres of 9-year-old blue gum trees. They took out 14,600 trees and obtained 1,200 cords of wood.

D. W. BALCH of San Francisco and S. C. Scoville were fatally shot at a meeting of the Directors of the Nevada and Oregon railroad company, in Reno, Nev., Monday.

A SLEEPING CAR on the Canada Southern railroad was thrown into the Detroit river at Amherstburg, Canada West, Monday. All of the passengers but one were saved.

THE ship *Alice Buck*, loaded with rails for the Northern Pacific railroad, went ashore at Half Moon Bay, south of San Francisco, and became a total wreck. Several lives were lost.

A BEAUTIFULLY cut California granite vase, from the Penryn Placer county Granite Quarries, has been presented to the State Mining Bureau. It stands 25 inches high, and is highly polished.

RUMORS of war between China and Japan are still afloat, and there is some talk of an Embassy being sent to Peking to effect a solution of the difficulty which exists between the two countries.

JAS. R. KEENE has purchased for $75,000 an estate near New Market, England, on which he intends having stables erected solely for the purpose of training his horses himself, going over to see them run and superintending all affairs connected with them.

CHOLERA has again made its appearance in Japan, and, singular to say, it has broken out in Kagoshima, the very same place in which the first cases occurred in 1877, when it made sad havoc throughout the land. The epidemic is said to be spreading rapidly.

KING ALFONZO, in the opening sitting of the Antiquarian Society, expressed the friendly feeling of Spain toward America. This society was founded at Nancy, France, in 1873, for the promotion of investigations into the antiquities and history of America, before and after its discovery by Columbus.

DR. BOYNTON has partially explained his views of the case of President Garfield. He reiterates the statement that the bullet was found in a basin, after an unsuccessful search in the region of the body where it was supposed to be located. A detailed account of the autopsy is being prepared by the attending surgeons.

ANOTHER rise in rents is recorded in New York, the advance being very decided over the price asked for houses last spring, the increase being all the way from 10% to 25% in attractive localities. Despite the large amount of building this summer, the demand for suitable dwellings is largely in excess of the supply.

TWO routes are under consideration for the California and Oregon railroad, the one by way of Redding, through Shasta and Siskiyou counties, and the other due south from Rosehurg, through the coast counties to Cloverdale, there to connect with the Donahue road. It is thought that this line will be completed in 1883.

THE whaling bark, *Daniel Webster*, was crushed in the ice off Point Barrow, during the latter part of last July. All of the crew escaped, with the exception of one seaman, who attempted to walk across the ice from Point Barrow to a point some distance below, but who perished from exhaustion. The balance of the crew were taken aboard the schooner *L. N. Handy*.

ALPH BEALL, the chief of the surveyors of the Idaho, Clearwater and Montana company, reports a discovery and thorough examination of a railroad pass through the Bitter Root range, south of the Loto, whose maximum altitude above the sea level is less than 4,500 ft., with approaches from both east and west upon a grade of less than 65 ft. per mile. There is no danger from snow slides. There are large quantities of the best class of timber along the route, which follows water courses nearly the whole distance from Lewiston to the summit of the pass. The party, in behalf of the company, made a location of the pass, broke ground, and did other work with the purpose of holding it.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

G. W. McGREW—Santa Clara county.
M. P. OWEN—Santa Cruz county.
J. W. A. WRIGHT—Merced, Tulare and Kern counties.
JARED C. HOAG—California.
B. W. CRENWELL—Yuba and Sutter counties.
D. W. KELLHER—San Joaquin and southern counties.
C. E. WETMORE—Alameda county.

Attend to This.

Our subscribers will find the date they have paid to printed on the label of their paper. If it is not correct, or it the paper should ever come beyond the time desired, be sure to notify the publishers by letter or postal card. If we are not notified within a reasonable time we cannot be responsible for the errors or omission of agents.

PERSONS receiving a sample copy of the MINING AND SCIENTIFIC PRESS *with this notice marked*, are requested to examine the merits of the same, and consider fairly its claims for support, and if consistent, subscribe for the paper through the P. M. or agent delivering it, or otherwise. We will send it, on trial, at the rate of $4 per annum for any period the reader may wish. Please notice our terms elsewhere, and if desired, send for further samples and information. Those who can circulate this No. further to our advantage are invited to do so.

IMPORTANT additions are being continually made in Woodward's Gardens. The grotto walled with aquaria is constantly receiving accessions of new fish and other marine life. The number of sea lions is increased and there is a better chance to study their actions. The pavilion has new varieties of performances. The floral department is replete and the wild animals in good vigor. A day at Woodward's Gardens is a day well spent.

BOUND VOLUMES OF THE PRESS.—We have a few sets of the back files of the MINING AND SCIENTIFIC PRESS which we will sell for $3 per (half-yearly) volume. In cloth and leather binding, $5. These volumes, complete, are scarce and valuable for future reference and library use.

THE State Mining Bureau, No. 212 Sutter street, is open to the public from 10 o'clock A. M., to 5 o'clock P. M daily, (Sundays excepted). Henry G. Hanks, State Mineralogist.

ANNUAL STATISTICIAN of 1881.—"It is the most complete and accurate work of its kind in the world."—*S. F. Call.* Address L. P. McCarty, 316 California st. Price, $4.

COPP'S "U. S. MINERAL LANDS, LAWS, FORMS, INSTRUCTIONS AND DECISIONS."—1881. 570 pp. In full law binding, $4.50; half law binding, $3, at this office.

And in accordance with law, and an order of the Board of Directors, made on the 20th day of August, 1881, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the Auction Rooms of Maurice Dore & Co., 410 Pine St., San Francisco, California, on Monday, the 17th day of October, 1881, at the hour of 10 o'clock, A M., of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

GEO. H. PECK, Sec'y.

Office—Rooms of Dr Knowles, 118 Dupont street, San Francisco, Cal.

Newcastle Gold Mining Company.—

Location of principal place of business, San Francisco, California. Location of works, Yankee Hill Mining District, Placer County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the Twenty-third (23) day of September, 1881, an assessment, (No. 2) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 33, No. 318 Pine St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the First (1) day of November, 1881, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the Twenty-first (21) day of November, 1881, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

E. G. MATHEWS, Sec'y.

Office—Room 33, No. 318 Pine St., San Francisco, Cal.

Scientific, Mining and Other Valuable Books.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL.

MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, $7.50

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 155 pages, embracing illustrations of furnaces, supplements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, $3.00 coin, postage free.

HOISTING WORKS

FOR SINGLE OR DOUBLE SHAFTS, TO WORK TO ANY DEPTH, OF LATE AND IMPROVED DESIGNS, SUPERIOR TO ANY OTHER MAKE; ADAPTED TO THE REQUIREMENTS OF PRACTICAL WORK AND EMBRACING ALL THE IMPROVEMENTS AND SAFEGUARDS THAT EXPERIENCE HAS PROVED VALUABLE IN THIS CLASS OF MACHINERY MINING CAGES, CAR AND BUCKETS, ALSO MILL AND MINING MACHINERY OF EVERY DESCRIPTION. SEND FOR CIRCULAR. RANKIN, BRAYTON & CO., PACIFIC IRON WORKS, SAN FRANCISCO, CAL.

BUY LAND

Where you can get a crop every year; where you will make something every season; where you are sure of having a crop when prices are high; where you have a healthy place to live; where you can raise semi-tropical as well as other fruits; where you can raise a diversity of grain and vegetables and get a good price for them. Go and see the old Reading Grant (in the upper Sacramento Valley), and you will find such land for sale in sub-divisions to suit purchasers—at reasonable rates and on easy terms. Send stamp for map and circular to EDWARD FRISBIE, proprietor, (on the Grant), Anderson, Shasta Co., Cal.

ST. DAVID'S.

A FIRST-CLASS LODGING HOUSE

CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from $2.50 upwards

R. HUGHES, Proprietor.

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

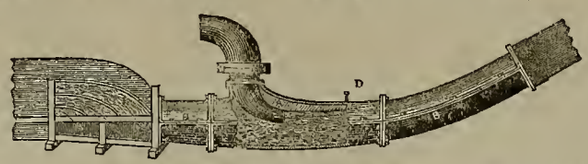
HYDRAULIC GRAVEL ELEVATORS,



For working flat gravel mines that have no dump.

Sluices gravel and water up hill on an angle of 45°, and will run any kind of gravel that will run in a flume. Handles rocks as easy as fine dirt, and will raise as much material as the water will carry off in a flume on 6 inches grade to 12 feet.

No bedrock cuts, tunnels or drains required. Machine a sufficient drain itself, and the process of mining the same as any other hydraulic mine. Is now a practical success in various places in California and Oregon. Send for descriptive circular to

JOSHUA HENDY.

No. 51 Fremont Street, Office of the Hydraulic Gravel Elevating Mining Co, S. F.

TONITE.
Miners! Attention!

With the approach of winter, the dangers which attend the handling and use of all Giant Powders (Nitro-Glycerine mixtures) are increased.

The lives annually sacrificed in thawing or using frozen cartridges, should be a warning to all to abandon Powders which freeze at 42° Fahrenheit. All Nitro-Glycerine Powders freeze at that temperature, and now for the first time Miners on this Coast have an opportunity to AVOID THESE DANGERS.

TONITE NEVER FREEZES!

NOR IS THERE ANY LIQUID SUBSTANCE IN IT TO LEAK OUT.

It is Always Ready for Use, as well in the Coldest Regions as the Tropics.

☞Miners are cautioned to take no stock in the slanderous reports about TONITE circulated anonymously or otherwise by the Giant Powder Company. They are all untrue.

TONITE POWDER COMPANY,

JOHN A. CHURCH, E. M. PH. D.
MINING ENGINEER,
Room 75, 115 Broadway, New York.
☞Agent for PADDOCK'S Ore Dressing Machinery. Mining Machinery supplied.

San Francisco Cordage Factory.
Established 1856.
Constantly on hand a full assortment of Manila Rope, Sisa Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.
Extra sizes and lengths made to order on short notice.
TUBBS & CO.,
611 and 613 Front Street, San Francisco

WATER JACKET SMELTING FURNACES

FOR SILVER, LEAD AND COPPER ORES WITH NEW AND IMPORTANT IMPROVEMENTS. HAVING FOR MANY YEARS MADE A SPECIALTY OF THIS LINE OF WORK, AND CONSTRUCTED, WITH FEW EXCEPTIONS, EVERY SMELTER IN USE ON THIS COAST, WE ARE PREPARED TO GUARANTEE MUCH BETTER RESULTS THAN CAN BE OBTAINED FROM THOSE OF ANY OTHER MAKE, AND THE BEST RESULTS POSSIBLE ON ANY CLASS OF ORE. SEND FOR CIRCULAR. RANKIN, BRAYTON & CO., PACIFIC IRON WORKS, SAN RANCISCO, CAL.

AMERICAN EXCHANGE HOTEL.

Sansome Street, (Opposite Wells, Fargo & Co's Express), San Francisco.

This Hotel, under the management of CHAS. MONTGOMERY, has been thoroughly renovated, and being in the very center of all the Banks, Insurance Offices and Commission Merchants, it offers special inducements to Merchants from the Interior and Farmers.

Board, with Room, $1, $1.25 and $1.50 per day. Special rates by the week or month.

FREE COACH TO AND FROM THE HOTEL.

PEBBLE SPECTACLES.

Muller's Optical Depot,
135 Montgomery St., near Bush.

SPECIALTY FOR 30 YEARS.

WHOLESALE AND RETAIL.

The most complicated cases of defective vision thoroughly diagnosed, free of charge. Compound Astigmatic Lenses Mounted to order in *Two Hours* notice.
☞Orders by mail promptly attended to.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, OCTOBER 8, 1881.

VOLUME XLIII Number 15

The Right to Mine by Law and Custom.

In its answer, in the Superior Court, to the People *vs.* The Gold Run Ditch and Mining Co., the mining company makes some telling points on the question of the laws and customs of miners, and their rights to continue mining, as the following paragraphs show:

Defendant denies that the navigability of the Sacramento river, or the roads or highways in the American and Sacramento valleys, are in danger of destruction or injury from alleged wrongful acts of defendant, or by anything that it intends to do; also denies that from the tailings or deposits from defendant's and other mines, the beds of the American or Sacramento rivers will become so choked and filled up as to turn said rivers from their natural channels, or that said valleys will thereby become dismal swamps, and incapable of cultivation or habitation, or that the working of said mines will in any way contribute to such injurious results.

XII. Defendant as a separate defense avers that it is a duly organized and incorporated body, under the laws of the State, for the purpose of mining by the hydraulic process, and has been engaged in hydraulic mining, and the sale of water to miners and others since August, 1870; that it is the legal owner and possessor of the mines and mineral lands mentioned in the complaint; that defendant has been the owner and possessor of said land and mines since 1872; that the natural discharge of water and tailings from said mines is into Canyon creek, which empties into the north fork of the American river about 70 miles by river above Sacramento; that said mines are located in the Gold Run mining district, which was organized in 1854, and which has ever since maintained its organization as such; that said mines were located and acquired by the grantors and predecessors of defendant in accordance with mining laws and customs of miners in said district, at various times between the years 1854 and 1863; that the right and title thereto has ever since been held in accordance with such laws, customs, etc., and in accordance with the statutes of California, and the decision of the courts of said State and the Acts of Congress; that said mines are of the class distinctively known as hydraulic mines, and have been continually worked as such by the present and former owners from 1854 to 1881, during all of which time defendant and its predecessors have discharged the tailings and water therefrom into said Canyon creek and upon its banks, being upon lands owned by defendant and held under mineral patent from the United States; and that such mining and discharge of water and tailings was in accordance with the laws and customs of miners and the statutes and decisions of the State and the United States relating to mines and mineral lands; that said Canyon creek is the natural and only outlet from defendant's mines: that the discharge of tailings and water therefrom since 1854 to July last have always been upon defendant's own patented lands in said Canyon creek and upon its banks, and nowhere else, and that only such quantity of tailings have been so dumped as was indispensable in working said mines, and as defendant had a right to do. Defendant avers that 16 hours per day, for five months in the year, is the average time during which it has worked its said mines; that 2,150 inches of water is the full amount used at any time, and that not more than 500,000 cubic yards of earth have been annually washed down.

W. A. SKIDMORE, of the Miners' Association, accompanied by engineers W. T. Lewis and P. M. Randall, are examining the mining region on the headwaters of the American river in connection with the forthcoming suits brought by the State against the Gold Run and other companies.

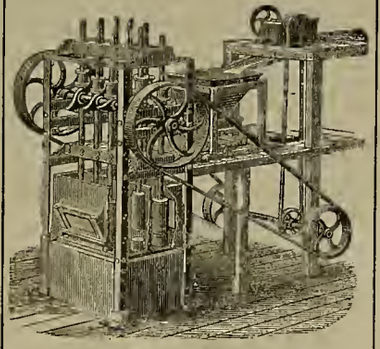
THE Oroville *Mercury* says: During the past week M. Manson with a crew of men have been in town, making cross sections of the river at various points between the mill and the lower end of town. He is employed by Col. Mendell, and the object of these surveys is to show the capacity of the river at various points.

New Style of Quartz Mill.

C. H. Baker, of 18 Fremont street, this city, has recently patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a composite frame stamp mill having ten stamps on one foundation. This arrangement is shown in the engraving on this page.

By the combination of two mortars on one mortar block, as illustrated here, with discharge from front, rear and ends in dry crushing, the inventor claims to be able to furnish a complete 10-stamp mill, with strong angle-iron frame and wood girders for cam shaft and stem guides, giving greater strength, and at the same time, less friction and jar on the machinery, than a wood frame of the old style. The iron corner posts rest in cast shoes, fastened to sills running back under ore platform on each side of mortar block, the frame having independent foundation from mortar.

The parts are so fitted together and marked that any good miner can readily put them in place. While this style of mill retains all the old and well-established advantages of the ordinary stamp mill—the frame work being mainly



Composite Frame Stamp Mill.

of wrought iron—it is not affected by exposure. All the timber used is a good mortar block and platform for ore-feeders, etc.

The building can be of the most temporary nature. Much time and costly labor, as well as freight, can be saved by this style of mill.

Alaska Mines.

Private advices from Sitka by U. S. S. *Hassler* gives us some news which will be of interest to miners, inasmuch as it shows the difficulties of prospecting in some parts of that country. The U. S. S. *Wachusett* had left for Yokatat on Behring bay, for the purpose of arresting, if possible, the Indian who murdered two white men—Kerren Campion and Thos. Maloney—at that place about three months since, and to bring him down for trial, together with the witnesses expected to testify against him. The murdered men were with James Hollywood on his schooner the *Gold Hunter*, a vessel of eight tons, on a prospecting and trading tour. Campion and Maloney started in a canoe belonging to Andrau by an Indian, to ascend some of the rivers in prospecting. The same day, two women, who were gathering grass for baskets on the beach, were attracted by the shots and cries, and discovered the murder. The Indian had remained in his canoe as they landed to make a meal, and, taking possession of Maloney's double-barreled shotgun, shot the latter dead; then fired at Campion and wounded him in the shoulder, and, after a struggle, killed him with a piece of rock. On seeing he was discovered, he pursued the women, who escaped in their canoe. On his return to the village, he made an attempt to kill Hollywood and his wife, who is an Indian woman, together with their children, but was prevented by the Indian doctor and others. The murder was kept quiet for a month, and then told to Hollywood's wife by a boy. It was afterward confirmed by others, among whom were the two Indian women already mentioned. If it had not been for Hollywood's wife, who was an Indian, and traveling with them, they would have killed Hollywood. The latter sailed from Yokatat, in March last, having been compelled to stay there during the winter on account of the danger in navigating the coast at that season. As it was, his vessel was wrecked before reaching Crose sound. Before leaving he had discovered placer diggings which he estimated worth $10 per day to the hand. He took out a quantity of the dirt, and was bringing it with him when his schooner was wrecked.

The miners have long wished to prospect that region, but were deterred by the fierce character of the natives, who have always been dangerous. Some six years ago, they murdered a boat's crew belonging to a schooner which was trading there, but nothing was ever done about it. The visit of the *Wachusett* may result in making it safe to prospect there, and miners, in order to obtain further information, procured, through Capt. Lull, the employment of Mr. Edmund Bean, a miner of long experience, as one of the interpreters of the expedition, and he will make thorough examination of the country. If his report is favorable, there will probably be a new camp started there in the spring. Mr. Hollywood accompanied the party for the purpose of pointing out the murderer.

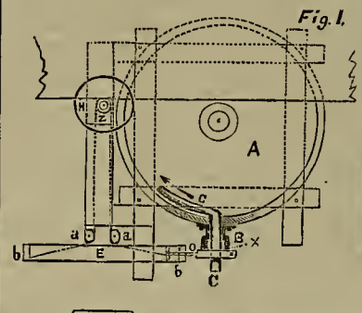
A DISPATCH from Florence (Arizona) says: The *Enterprise* has the following particulars of a rich strike in Mineral Hill camp, 15 miles east of Florence. The north croppings of the Alice mine were prospected yesterday, and found to be wonderfully rich in horn silver. An assay of the ore gave a return of 1,346.81 ozs. in silver to the ton, the assay value of which is $2,387.75. These croppings rise 12 ft. above the surface rock, and are 12 ft. wide and 400 ft long. Shots were put in at different points and one very rich piece of rock broken, in which horn silver could be seen with the naked eye. It is estimated that these croppings contain over 4,000 tons of this rich ore. The strike has created great excitement in the camp.

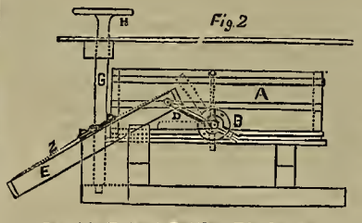
KLAMATH river gravel will no doubt pay well its entire length, but the great body of water below Scott river has prevented much work being done below that point. Efforts have been made on a limited scale in the way of wing-damming, but only to mine ground close to shore, while expensive works to reach the bed-rock channel would realize rich returns. There are now 100 men engaged in river mining between the mouth of Humbug and Scott rivers, in the Klamath, and next season there will be double this number, as many new claims have been taken up.

Discharge for Amalgamating Pans.

Amalgamating pans and settlers have on their outside surface a series of thres, four or five spouts, each provided with a plug to stop up the opening. In drawing off the contents of the settlers, it is important to do it gradually; but the plug holds form inefficient means of doing this, as between one plug hole and the other there must be an intervening space, which, when opening the plug next below this one last opened, the outcoming water will have a head or pressure in proportion to the distance between each plug opening, thereby creating a disturbing current in the already revolving mass of the pulp within the settler, which will cause a certain amount of the small globules of quicksilver to be drawn off and lost, besides also drawing off the quicksilver which will accumulate in the inside cavities of and around the plug openings, on the inside surface of the settler.

H. S. Jacobs invented not long since an apparatus for discharging pans, so as to overcome these difficulties, and this is shown in our engraving. It is made at the Pacific Iron Works, in this city.





Jacob's Patent Settler Discharge.

The device consists of an L-shaped pipe, introduced into the side of the settler near the bottom, inclosed in a stuffing box.

The inner branch of this pipe is made to conform to the curve of the side, with its opening in the direction of the pulp current. When the settler is charged, the pipe is in a vertical position, projecting above the level of the pulp. When a charge is drawn off, the end of the pipe is lowered just beneath the surface, until the discharge is completed, when it is again turned to a vertical position. By thus gradually lowering it, the discharge takes place without creating any counter-current, thereby preventing any sudden delivery and giving full time for the floating quicksilver and amalgam to settle.

To the outside end of the pipe is attached a lever, which, by a simple device, can be operated by a hand-wheel from the top of the settler, or it can be operated by hand from the floor below. This device can be attached to settlers in use without any appreciable loss of time.

In the engraving *A* is the settler and *B* the nozzle, this nozzle having a recess, *x*, in its front part so that when the discharge pipe *C* passes through this nozzle and plays within it, it allows of packing around it, to prevent leakage. *D* is a lever fastened to the discharge pipe *C*, in front of and against the outside face of the nozzle *B*, thus keeping the packing in the recess *x*, from slipping off. The end of the lever is set into a wooden or iron bar, *E*, and fastened to it by a pin running through both lever and bar, making a swinging joint. This bar *E*, rests in a slanting position either directly upon the floor of the mill through a slot made for the purpose, or upon a suitable support expressly placed for its reception. Two rope sheaves, *a a'*, receive the rope *z*, fast at each end of the bar at *b b'*. This rope starting from the end passes along the length of the bar thence around the pulley in sheave *a*, thence at right angles around several times the shaft, *G*, back to and around the pulley *a'*, thence along the bar *E*, and fastened to the opposite end from the starting one. The upright shaft, *G*, has a hand wheel, *H*, and the lever is thus operated. Any suitable mechanical device can be used for raising the lever, of course.

IN Wood River recently, the owner of a mine having become discouraged at the outlook and continual expense, sold his claim for $150. The purchasers went down a few feet and found the ledge, and followed it on an upraise until it came within 2 ft. of the surface. At this point the ledge was 10 ft. wide and assayed $1,000 per ton. The investment of $150 can be sold for $100,000.

THE ditch and flume of the Willow Creek Gold Mining company, near Camptonville, Yuba county, are completed and the water turned on. An elevator is in place and running.

Safford District.

A representative of the Eureka *Sentinel* visited the new Safford district some days ago. The *Sentinel* says: There is no other such sligihls location on all the Pacific coast for cheap and snccessful mining. The splendid water power of the Humholdt river, capahle of driving thousands of stamps, mey he utilized at a trifling expense. The mines ere situated within two miles of the river, all the way down grade. Oree that will yield $12 to the ton can he worked at a profit. Fortnnately there are no such inferior oree in the camp. Higher grade ores largely predominate; thie is one feeture of the new district that must inspire everyone with confidence in its great valuo. Assaye from the gress roots rnnning $500 end $600 are of common occurrence. In many instances, the croppings ahove the surface go from $100 to $300 to the ton. The writer took a half dozen pieces of rock from the Contention mine, not two ft. below ground, which gave a most flattering retnrn. We forwarded these samples to Herry Rosener, San Francisco. Yesterday we received a telegram from him steting that the average was $253 in eilver, certainly rich enough for top rock. The mineral helt stretches away for a dozen miles. It seeme to he ahout 1,000 ft. wide, and is as well defined and as easily followed as Main street, Eureka. A dozen mines were being vigorously worked at the time of our visit, and ail held ont the hrightest promises. We may say deliherately and candidly that Safford district presents a better showing on top, of rich mineral and hold outcrop, than any other locality in the State of Nevada. Thie mnch cannot he gainsaid. Whether the mines go down is a qnestion to he determined by futnre development. We believe they do. The evidences in support of thie conclusion are ahnndant and cen hardly misleed the experienced eye. It is in accord with our ohservations in the mining districts of this State that the size of the outcrop ie generally a feir index of the dimensione of the ore bodies when depth ie attained. In this particular Safford has the call over any mining section on the coest, not excepting the famone Comstock. The more prominent mines visited were the Onondaga, Contention, Illinois and Bull'e Heed. The latter hes a shaft 30 ft. deep and going down es fast ee three men could sink it. The Illinois was being industriously worked by Tom Jewell and his pertners. A ehaft had just heen started on the Contention. Many other cleims had made a stert, but we cannot go into details. A general opinion of the district ie all we thought of giving. That we were more than favorably impressed with its outlook, is already indicated in the foregoing. The chief development had heen made on the Onondaga. Here is disclosed an immense mass of good ore. Its extent ie not yet ascertained, bnt it is certainly very great. A tnnnel penetretee the body for a distance of 50 ft. and the end is not yet. We believe the Onondega will prove a great mine, and if it does there will he many other valnahle properties in the district. The contemplated town and ell else depends upon the mine. It will take a little time to settle definitely the permanency of the minss, thongh at present writing the weight of opinion is in their favor. Deputy County Surveyor Merry was husy as a nailer making surveys for the mines. He had eurveyed and merked the boundaries of the following claims: Nob Hill, Lodi, St. Julien, Watkins, Seminole, Oversight, Wallace, Belle of the Hill, Neet Egg, Mary Ann, Star, Cumberland, Albert, Griffin, Eureka. Onondega, Good Luck, Kentuck, Emma, C. & C., Comet, Illinois, Franlin, Bull's Head, Zanola, Flower Pot, Belcher, Contention, State of Meine, Pocahontes, Oneida, Grand View and Hunter's Find.

A NEW LUBRICATOR.—To produce within an oil box a constant pressure which shall insure a nniform consumption of viecous or consistent lubricants, Tovote hae designed a new lubricator. Throngh the cover of the hox, which has a verticel tuhe passing through it, another tuhe fitting closely, carrying a piston at the lower end, is inserted, which, by the constant jarring of rnnning mechinery, is made to exert continual pressure upon the unguent. The hollow piston-rod is loaded with shot to obtain the reqnisite pressure, determined by experiment. Once weighted with the proper load, the hox requirss no further attention nntil emptied, which need not occur more frequently than once in eight weeks, using a 3-inch journal. Extended experiments with textile machinery gave the following results: A 13-inch journal, making 21 revolntions per minute, required 45 ounces of oil in 48 days, while in the eame period but 3½ ouncee of grease were sufficient to do the same work. With a 4-inch journal still more favorable results were obtained; thie with 90 revolutions per minnte required 38 ounces of oil in 42 daye, while hut 0.35 onncee of grease answered the eame purpose when using Tovote'e lubricator. This device could not, however, and for obvions reasons, he used on mechaniem which revolves —*i. e.*, eccentrics, etc.—but in thoee cases the lubricator would he placed on the etrap, or some other relatively fixed member. In stationary machinery this device ie of particular advantage, as sufficient unguent could he supplied to last several months; the position of the piston-rod above the box cover would be a visible gnage of the quantity of material in the hox at any time.

The Carbonate Camp in the Black Hills.

The Black Hills *Miner* says: In cass our friends ahroad may think the carhonate camp which attracted so much attention a few weeks ego bas gone up like a rocket and come down like a stick, we will inform them, although the stampede ie ahont over and the temporary creze about ended, the camp is not played out by any manner of means. Many who deserted ell to get thee firet, as ie the cese in all etampedes, were mere surface prospectors, who lahor theoretically in their fervent imaginations. Practically, they did nothing bnt sit aronnd, dream of weelth, and coneume their provisions. The workers who meke mining camps, and in fact any other country, are etill toiling and developing their propertiee as far ee their means will permit them. On nearly ell the substantial claime the work needful to hold them for a year hee heen done. Meny who would remein there to develop their cleims have heen compelled to suspend operations until they work for another grub stake. Those who are ahle still continue their work. The opinion of an individuel who knowe nothing of mining ie of no greet value either for or against any conntry. Many who know nothing of the cemp, and have taken no trouble to ascertain the trnth are endeavoring to belittle it. So far as the country is concerned, it is a matter of little importance what they say. There is not the ehadow of a donbt carbonates are there; the float rock can he found for miles over the entire district; one or two mines have struck ore bodies from which they are taking mineral, and we are only waiting for emelters to reduce it. The majority of the claims heve just as good indicetions, hut they have not sunk on them deep enongh to discover the ore hody. The deepest mine there is not over 50 ft.; it would be strange indeed if the ore lay on top of the gronnd. The cerhonete of excitement wes the outgrowth of a legitimate discovery, and not a frandulent speculetion for the benefit of any clique or town. We have neither wanted nor encouraged the investment of ontside cepital. If there is anything in the camp, and there ie every evidence there is, thie city and the enrrounding camps will he the firet benefited by it, es they have invested their own cepital; if not, they are the only losers. We hegin to feel now as if we were not particular whether cepital came in to help us develop the conntry or not. We have toiled painfully on, knowing we had a good country, and have worked, hurdened by a thousand discouragements, nntil we oen now begin to eee our way clear. The mines which we were willing a year or two ago to sell for a eong are beginning to pay. We are heginning to reelize the wealth we knew we had if we could only get at it. We have developed minee in many instancee hecause they were too valnehle to throw away; we could not sell, there wee no capital in the conntry for thet purpose, and we had to work to hold them. In the next yeer or two meny a prospector will blees the poverty thet prevented him leaving here, the pareimony which kept the money in the pockete of capitalists who might have had hie mines, and the hard fate which compelled him to work his leeds, wherein lay hie fortnne.

REMOVAL OF THE MECHANICS' PAVILION.—The Mechanics' Pavilion, which has for many yeers occupied the site on the northeast corner of Mission and Eighth etreets, is to he at once torn down. The material will be employed in the erection of the new Pavilion on the block hounded hy Larkin, Hayes, Grove and Polk streets, opposite the new City Hall. The new Pavilion will be prectically the same as the old one, ae the latter will be taken apart in euch a way that the materiel can be pnt together again withont change. The Pavilion will he ehortened on the new eite, partly to conform with the needs of the Institute eo fer as the indnstrial fairs are concerned, and partly to accommodate a row of honses now fronting on Hayes street, which the Mechenics' Institute does not at present intend to disturb, as they bring a monthly rental of $400. It is also intended to heve the building ready for occnpancy next Christmas, when a fitting entertainment will probably he held. It will be placed on the lot in euch a manner that a brick fire-wall can be hnilt ontside of the frame, which will convert .the present temporary etructnre into a permanent earthquake-proof huilding.

WHITE PINE.—Over around Hamilton—eo we learn from parties in from there—the mining outlook appears brighter. It is now conceded as almost certain that Superintendent Kendall hae effected the sale and consolidation of the Ward Beecher, Edgar and Jennie A mines, and the California mill, with all the water privilegee attached thereto. The purchasers are London capitalists, ane they are now only waiting to get transcripts of titlee to the property before paying over the coin and assuming control. They will, it is said, commence active operations thie fall. We hope that the the more than Christian faith and fidelity of onr friends over there may eoon receive their reward, by the revival of its mining prosperity. Taken as a whole, the outlook, present and prospective, of the mining intereste of onr country appears brighter to-day than at any time within the pest fonr years.—*White Pine News.*

Placers in the Black Hills.

The Black Hills *Times* says: When the dry washer, as it is celled, is perfected, or any msthod in fect, whereby placers can he worked without water, then almost every foot of ground in the Hille can be worked, as fine gold is found everywherc. The gulches in the immediate vicinity of Deadwood have all been worked as far as known, althongh gold may still remain in nnexpected places in some of them. It ie impossihle to locate the exect position of the precioue metal, as gold is where you find it, and it hae heen found in apparently the moet nnexpected places. Mining history is full of surprises of that kind. Too much of a good thing ie good for nothing. Although it is imposeihle to mine without water, too mnch of it is worse, if possihle, than none at all. Rich minee on Castle creek had to he ahendoned for this reason, although a machine is now in operation which it is claimed could hendle the original delnge with profit. Decidedly the richest plecer minee fonnd in the hille are located in the Beer Gulch district, which inclndee a nnmber of gulches, known as Potato gulch, so named hecanse no potetoee are there, likely, Nigger, Beaver, Bear, Maloney, Send, and a number of smaller places, namee unknown, if they have any. The "Bear" country eeems to he the very center of the rich placer country, bnt unfortnnately there is hut little water. A sluice head of the precious fluid is aveilable about two monthe in the year only; after that the miners have to retnrn to firet principles, and rock out the precious dust. Notwithstending the difficnlty in working, the claime are said to have produced within the last five years $600,000, and millions more are in the ground, which will have to remein there nntil water can he procnred. The Spearfish *Register* says that Sand creek hes en ahundance of watsr, hut what ie known as the falls has alwaye interfered with mining in this gulch. These fells coneist of a ledge of rocke thrown acrose the streem, some 50 ft. in hight, form a naturel dam which hae exieted for ages, perhaps (thousande of years. The washings of not only Sand, hut Malory, Spotted Tail and many other smaller gulches have emptied their precious metals into thie reservoir for countless ages, almost. It has heen long known thet if this reservoir could he dreined, gold literally by the bushel would rewerd the promotere of the enterprise. Mr. Johnston, of the *Register*, nearly five yeere ago saw that in time capital wonld take hold of thie enterprise, and during all tbe years since has heen quietly picking up cleims on the ground referred to until he owned 28 or neerly 9,000 ft. of the very cream of Sand creek. This spring Mr. Johnson indnced cepitalists to teke hold of the matter. All summer a force of men have been hlasting a cenal some 18 ft. wide through the ledge or fall of rocke referred to.

Several of our solid men are interested in thie entsrprise, and we heve no douht their rewerd will he all they anticipate, as success seems assured. Nearly all the nuggets of any size have come from that country, and we have no douht meny more remein to be found.

Casa Grande District.

Thie district from which emall lots of very rich rock heve heen shipped dnring the lest eight months to San Francisco, where it was redneed, giving very handsome returns, is ahout to enter upon a new era of greet prosperity. Heretofore the greatest drawheck was a lack of water. Mr. Jerry Freyer, one of the pertiee most largely intereeted in the mines of the district, came near dying a few monthe ago from thirst and heet; in the district he hae recently etruck a good flow of water near the eurface. Now the last ohstacle to the development of mines in this promising district has heen removed, and we learn that a force of minere will be permanently at work,

Taking Out Rich Ore

From the minse of Mr. Freyer, in thet district, which is one of the hset mineral sections in the Territory. Col. Bredy and Judge Walker have heen engaged all eummer taking out ore and shipping it to San Francisco, which has worked $200 to the ton. The mines of these gentlemen are located a few miles from those of Mr. Freyer. At these claims water can he had hy sinking 8 ft. The discovery of an ahnndant eupply of water in Casa Grande district proves conclusively that water exists in much larger supply in the Territory than is generally snpposed, and that miners should not be disheartened ahout water nntil a systematic effort ie made to secnre it. In Castle Dome district miners packed water on hnrros a distance of 15 miles, for over 12 months, and hy accident it hecamo necessary to sink a hole in the camp, and hefore they had gone 4 ft., a splendid snpply of good water was found. We believe it can he secured in moet eections of the Territory if persone will only make an effort to find it.—*Arizona Journal.*

A CORRESPONDENT of the New York *Sun* writes as follows of the minee of Lumpkin county (Ga.): I fonnd that good resnlts have followed every well-directed effort, and wonder why these gold fields have heen so long neglected. I cannot say there are any big bonanzas there, as no work has been done on a scale to warrant large returns. The fields are as rich, if not richer than those of California, and the ore, though of low grade, is houndless in extent, and can he mined and milled at from 20 to 40 cents per ton.

Iron in Plumas County.

The Gresnville (Plumas county) *Bulletin* says: Now that there is a rsesonahls essurance of a railroed bsing huilt from Reno into this neighhorhood, the value of the deposits of iron ore in Plnmee county hecomes a subject of much importence. The value of iron, as compared with gold, is so small that, in a gold-producing conntry like this, people are not likely to think iron mining and menufactnring can he of any consequence to us at all. Pennsylvanie derives more wealth from her iron than California from her gold. St. Louis is dependent, in great measnre, npon Iron mountein for her prosperity. New York State owes much of her greatness to her iron mines. The same is true of Michigan and New Jersey. Sweden is a prosperone nation; withont her iron mines she would be next to nothing. Gold must alweys he the chief mineral weelth of Californie; anything that will lessen the cost of machinery will increase the production of gold. Pig iron now costs $72.50 a ton, leid down in Greenville. Fourteen yeere ago it was estimated that iron could he made in Plumas connty for $40 a ton; it could he made cheeper now than at that time. Would the iron made here he as good as that imported? Ie there ore enough, as well es fuel or flnx, to jnstify the erection of works? In answer to the first question, the celebrated German geologist, Beron Richthofen, said:

"Your minee cen hoast of the beet quality of iron ore which is known to exist. They consist eltogether of megnetic iron ore, the same from which the celebrated Swedish and Russien iron is manufactured. * * * None of those euhstences which, hy the emallest admixture, deteriorate the quality of iron (such as phosphorus or enlphur), appear to be preeent." To the second queetion, "Ie there enough?" he eaye: "One million four hundred thousand tone can he got by opeu quarrying in Gold valley alone." And for fuel, "the vicinity offere en almoet unlimited supply of charcoal by the extent of forests of pine end spruce." Speaking of flux, he says: "The ore is a mixture of pure megnetic iron ore with carhonete of lime, which improves the ore hy serving as a flux. * * * Limestone, which altogether is rether of rere occnrrence in the Sierra Nevada, is fonnd in Gold valley, closely accompenying the oree of iron." On the water snpply, he says: "Water is abundent the year round, being afforded hy numerone small streams emptying into Gold valley." The mining and manufacturing of iron nscessarily employs a great dcal of lahor. Should this projeot be carried out, it would, to a certeinty, increase the population, husiness end wealth of the county enormously. Thongh not a single ton of the iron made should go to the Secremento velley, onr own county, together with Sierra, Placer, Butte and Nevada countiee, ae well as the State of Neveda, wonld give a market for vast qnantities, and where no successful competition conld be made. We firmly helieve the manufacture of iron will he established in Plumas conty in the not distent future. Wheu it is, we will enter on a cereer of prosperity such as few now imegine. Then a railroad to Orovillo will he huilt, hecauss it will he an aheolute nececsity.

HARDINESS OF PALMS.—Our palm growers may be interested in a note on the effect of frost on two epecies of chamœrope which we find in an Englieh exchange. Commenting on recent ohservation in France it saye that of all the palms, *Chamærops excelsa* is the hardiest. *C. humilis*, which is indigenons in the south of Europe, and grows well at Montpelier, ie very hardy when adult, hnt tender in the young state. Side hy side, heds of young plants of *C. humilis* and of *C. excelsa*, of one or two yeare' growth, each plant having three or four emall leaves, were exposed to a severe frost in Jannary last (therm. 10° Fahr.); all thoee of *C. humilis* were destroyed, while those of *C. excelsa* were unhurt. Adult plants of *C. humilis* were not injured. Thie ie a lower temperatnre than may be expected in most parte of California. We have yonng plants of these two species in our garden in Berkeley which were not injured last winter. We lost a *Corypha Australis* but a *Latania Bourbonica* did not snccnmb, although it has put forth rather sickly colored leaves this summer.

A NEW CRUCIBLE FOR PRODUCING ZINC.—Mr. A. Landsberg, near Aix-la-Chapelle, has recently invented a new crucible for producing zinc from pnre oxides, or such as are mixed with other metallic oxides. Almost universally, at the present day, crucibles for producing ziuc by reduction and distillation of roasted hlende or calcined ore, when pure or mixed with other metallic oxides, are made of fire-clay, although crucihlee made of a mixture of graphite and clay have been experimented upon with partial euccess. Those made of fire-clay are destroyed on the insine by the combination of the eilicate of alumina, and with the materials heated in them forming various eilicates. The cruichles made of graphite and clay are destroyed externally as the fire hurns out the graphite. The new method consists of making the crucible of two layers closely united; the outer is composed of fire-clay resisting the heat; the inner is made of graphite and clay resisting chemical action. Each is a protective covering for the other. Charcoal, coke or mineral coal may he snhstitnted for graphite.

MECHANICAL PROGRESS.

Mechanical Applications of Electricity.

At the late meeting of the "British Association" as it is familiarly called, one of the speakers took up the question of the mechanical applications of electricity, which he discussed in a most interesting and instructive manner. He remarked that many people looked upon electricity as a panacea for all mechanical deficiencies; as our greatest dependence in the future for the production and application of mechanical power. In discussing this possibility the speaker proceeded to say:—

The difference between heat and electricity in their modes of mechanical action is very wide. Heat acts by expansion of volume, which we know to be a necessarily wasteful principle, while electricity operates by attraction and repulsion, and thus produces motion in a manner which is subject to no greater loss of effect than attends the motive action of gravity, as exemplified in the ponderable application of falling water in hydraulic machines. If, then, we could produce electricity with the same facility and economy as heat, the gain would be enormous; but this—as yet, at least—we cannot do.

At present by far the cheapest method of generating electricity is by the dynamic process. Instead of beginning with electricity to produce power, we begin with power to produce electricity. As a secondary motor, an electric engine may, and assuredly will, play an important part in future applications of power, but our present inquiry relates to a primary and not a secondary employment of electricity.

Thus we are brought to the question, from what source, other than mechanical action, can we hope to obtain a supply of electricity sufficiently cheap and abundant to enable it to take the place of heat as a motive energy? It is commonly said that we know so little of the nature of electricity that it is impossible to set bounds to the means of obtaining it, but ignorance is as likely to mislead in the direction of exaggerated expectation as in that of incredulity. It may be freely admitted that the nature of electricity is much less understood than that of heat; but we know that the two are very nearly allied.

The doctrine that heat consists of internal motion of molecules, may be accepted with almost absolute certainty of its truth. The old idea of heat being a separate entity is no longer held, except by those who prefer the fallacious evidence of their senses to the demonstrations of science. So also the idea of electricity having a separate existence from tangible matter must be discarded, and we are justified in concluding that it is merely a strained or tensional condition of the molecules of matter. Although electricity is more prone to pass into heat than heat into electricity, yet we know that they are mutually convertible. In short, I need scarcely remind you that according to that magnificent generalization of modern times, so pregnant with great consequences, and for which we are indebted to many illustrious investigators, we now know that heat, electricity, and mechanical action, are all equivalent and transposable forms of energy, of which motion is the essence.

To take a cursory view of our available sources of energy, we have, firstly, the direct heating power of the sun's rays which, as yet, we have not succeeded in applying to motive purposes. Secondly, we have water power, wind power and tidal power, all depending on influences lying outside of our planet. And thirdly, we have chemical attraction or affinity. Beyond these there is nothing worth naming. Of the radiant heat of the sun I shall have to speak hereafter, and bearing in mind that we are in search of electricity as a *cause*, and not an *effect*, or motive power, we may pass over the dynamical agencies comprised under the second head, and direct our attention to chemical affinity as the sole remaining source of energy available for our purpose.

At present we derive motive power from chemical attraction through the medium of heat only, and the question is, can we, with advantage, draw upon the same source through the medium of electricity?

In discussing this proposition the speaker proceeded in the usual way to show the difference in cost between the use of coal and zinc for producing energy, and concluded with the idea that in the absence of water power for the production of electrical energy, we must eventually resort to the principle of the thermal battery, and by that means utilize the sun's heat, which, in tropical countries, is equivalent to 4,000 horse-power over every acre of surface. In dealing with the sun's heat we could afford to be wasteful. Waste of coal means waste of money; but the sun's heat is passed out in endless profusion. The speaker closed his most interesting address as follows:—

"In conclusion, I may observe that we can scarcely sufficiently admire the profound investigations which have revealed to us the strict dynamical relation of heat and electricity to outward mechanical motion. Up to this time our knowledge of energy is almost confined to its inorganic aspect. Of its physiological action we remain in deep ignorance, and as we may expect to derive much valuable guidance from a knowledge of Nature's methods of dealing with energy in her wondrous mechanism, it is to be hoped that future research will be directed to the elucidation of that branch of science which as yet has not even a name, but which I may provisionally term 'Animal Energetics.'"

Mechanical Air Navigation Possible.

Notwithstanding the numerous ineffectual attempts in this city to produce a machine that will navigate the air and be subject to the will of the pilot, the thing has been successfully accomplished elsewhere. The Boston *Journal of Commerce*, in a recent number, gives the following:

Four years ago Charles F. Ritchell of Bridgeport, Conn., made some public exhibitions with an air-sailing contrivance that attracted considerable attention at the time, from the fact that his machine could be absolutely governed in ascent and descent by mechanical means, independent of a levitating gas, and relatively directed in a horizontal course. At that time, in a trial made at Hartford, Conn., his machine, as witnessed by the writer, went to a height, perpendicularly with the level of the ground, of at least 300 ft., passed eastwardly over the Connecticut river, turned about and came back to the point of starting, and landed at the feet of the gentlemen who, as a committee, witnessed the ascent.

The next day the apparatus was sent up when a considerable breeze was stirring. The operator took his car up to a line of moving air that carried him away a distance of nearly nine miles. But, working his way down, he was able to descend into a door yard, call for and obtain a glass of water, and then re-ascend, but was unable to get back to his starting point against a breeze. In short, this trial demonstrated the fact that such a machine as that could not contend against adverse wind. But it also demonstrated that mechanical means could guide as well as propel in the air, and more, that mechanical means could be successfully employed to elevate and depress the position of the aeronaut at will.

But these experiments also proved that the limit of guiding and elevating control was confined to that of the power to be employed—which must be manual, as combining the largest amount of exerting force with the smallest amount of weight.

In the experiments made at this time the machine used was a cylindrical gas-holder, suspended horizontally over a frame bolding the aeronaut. This frame was made of hollow, thin steel pipe, combining great strength with little weight. The operator, when seated, made a weight which, with the machine, would be just about the balance in the atmosphere by the gas-holder. To ascend, the operator rotated rapidly a fan on a vertical shaft directly under the center of the contrivance, the fan acting like the propeller of a ship.

A similar propeller in front of the operator, on a horizontal shaft, produced a horizontal movement. This front propeller worked on a universal joint, so that it could be turned to face 30 degrees of the circle, or at least as much as the rudder of a vessel at sea.

It will be seen by this brief summary that the Ritchell machine could be elevated and depressed, and guided in horizontal planes by means of rapidly revolving fans—it has been demonstrated that this can be done. But the limit of action is narrow, as it is controlled by the power supplied by the operator. This power, as applied to lifting, Professor Ritchell finds, is only about 15 lbs. He now proposes to make an experimental machine carrying an engine, to be fed with compressed air, which will furnish available power to lift a very much larger weight and more perfectly control the lateral movements of the machine. He is at work on it now, and when completed it will be exhibited in some large hall or in connection with some exhibition that has sufficient tent area to give room and exclude wind.

THE *Moniteur Industriel* describes a new covering for gutters or leaders crossing sidewalks. Heretofore these covers were plates of cast iron, the surface of which was broken by elevated ridges. Much travel, however, wore these plates quite smooth and polished, making them dangerous to tread upon. The government of the city of Paris is now laying new covers, which are cast with a ridge around the edges, forming a font or basin, which is filled with bitumen or asphalt flush with the sidewalk; this leaves but two narrow ridges of metal exposed, which give no trouble. Throughout the Rue Richelieu these covers have been placed, and the city is introducing them in the Rue Montmartre.

MOLDING CAST STEEL WITHOUT BORAX.—A correspondent of the *Blacksmith and Wheelwright* offers the following recipe for welding steel without borax, which he desires some of his brother smiths to try: Copperas, 2 ozs.; saltpeter, 1 oz; common salt, 6 ozs.; black oxide of manganese, 1 oz.; prussiate of potash, 1 oz. All should be pulverized and mixed with 3 lbs. of nice welding sand. With this preparation welding can be done at a cherry heat.

SCIENTIFIC PROGRESS.

Magnets Identical in Strength.

For some time past, M. Trouve, the eminent Parisian instrument maker, has been engaged in discovering the best mode of making powerful magnets of identical strength. For this purpose he has investigated the best kinds of steel, the most suitable degree of temper, and the most practical and simple method of magnetization. In testing the different kinds of steel, he cut the pieces of the same dimensions and magnetized them, then measured their portative force. They were afterward tempered and magnetized anew. The portative force, after this second magnetization, has led M. Trouve to the conclusion that the best French steel for making bar magnets is that of Allevard, as already known. He also finds that the portative forces, as determined after the two magnetizations, are connected by a simple law which can be expressed by saying that they are to each other in the ratio of $n : n^2$ —that is to say, if the portative force of the first magnetization is represented by 2, 3, and 4, that due to the final or saturated magnetization is represented by 4, 9, and 16. As regards the temper of the steel, M. Trouve finds that a regular temper is necessary, and to insure this condition he employs a muffle furnace heated by gas to a constant temperature. The actual magnetization of the bars is performed by placing them in two solenoids in juxtaposition, and closing the magnetic circuit by means of two plates of soft iron. The solenoids are then electrified by means of the current from six Wollaston elements. By proceeding in this manner, M. Trouve succeeds in preparing bar magnets which will sustain from 12 to 14 times their own weight, and if they are bent into horseshoe form the portative force is quadrupled—that is to say, it becomes 48 to 56 times the weight of the magnet.

EARTHQUAKE SHOCKS IN DEEP MINES.—It has been frequently stated that earthquake shocks are seldom felt at any great depth beneath the surface, as in deep mines. This reported fact has given much hold to the electric theory of earthquakes, under which the earth would not be supposed to be disturbed at any considerable depth. But the following item, clipped from a late English paper, puts quite a different face on the matter: "A severe shock of earthquake is reported to have been experienced in the mining district of Teversal, in Nottinghamshire, about noon on Friday last, (Aug. 1881.) In one of the pits belonging to the Stanton Iron Works Co., the miners were so alarmed at the shock and the accompanying noise that, thinking an explosion had occurred, they rushed to the mouth of the pit. In the Pear Tree Inn, Fackley, bricks were removed from the chimney, and the same thing was noticed in a house at Taversal. The stationmaster at the latter village, while sitting in his house, was thrown from his seat by the shock, and a quantity of plaster was detached from the ceiling. There was no explosion in the mines or other circumstance to account for the phenomena, and an upheaval of the floor of one the pits indicated that the cause of the disturbance was below the workings. One of the pits is 1,290 ft. deep. The shock traveled in a northwest direction."

A SIMPLE METHOD OF TESTING BUTTER FOR WATER.—Among other practices had recourse to for fraudulently increasing the weight of butter, the commonest and most useful to the adulterator, because not easily estimated by the purchaser, is that of incorporating it with large quantities of water. Ewin Johanson, the author of this paper, takes the average amount of water in unsophisticated butter to be 10% to 12%, and considers all above that as a fraudulent excess, and gives the following easy and quick method of testing the matter: Five g. of butter are brought into a burette graduated into $\frac{1}{10}$ c.c., and treated therein with 25 to 30 c.c. of petroleum, ether or benzine, the whole put in a warm place and often shaken, so as to dissolve the fats, and then left to settle. The solvent is then poured off from the aqueous stratum, and this latter again treated with the same quantity of petroleum, ether, or benzine, as before. When the mixture has again settled the number c.c. of water are read off, and the percentage calculated.

FOSSILIFEROUS METEORITES.—The impression of the existence of fossiliferous remains in meteorites seems to be gaining ground among scientists. Reports of such finds have already been given in these columns, and now comes Dr. Hahn, of Tuebingen, who thinks that he has discovered traces of fossils in meteorites, which belong to the siliceous division. One class of meteorites is entirely metallic; the other, containing siliceous substances, has been subjected to examination, and the doctor believes he has been able to prove that they are composed almost exclusively of fossil organisms, compares them to the detritus of coral rocks. He adds that complete forms are rarely to be met with, but elements sufficient to reconstruct them. He has succeeded in establishing the existence of about 50 species of polyps, algæ, glued together by a siliceous cement. These fossils sometimes present much resemblance to those of terrestrial origin. At present these conclusions can only be accepted as hypothesis requiring verification.

Scientific Meetings.

The 30th session of the American Association for the Advancement of Science, which was recently held at Cincinnati, was largely attended and one of much intrinsic interest in the cause of science. The papers read were many and varied, and some of them exhibited evidences of much careful investigation in the line of original research.

At the late Geographical Congress, which met at Venice, several letters of distinction and diplomas were made to the American Section for important additions which have been made during the last two or three years to the geographical knowledge of this continent.

A Congress of geologists assembled at Bologna on the 26th of September, at which all civilized countries were represented. The principal object of the congress was to confer together with the view of effecting a uniformity in the geological nomenclature of the world. The deliberations were conducted in French. We have not as yet seen any report of the proceedings.

VELOCITY OF LIGHT AND ELECTRICITY.—The probable identity of wave velocity in light and electricity has been established in various ways. Weber and Kohlrausch measured the quantity; Sir William Thompson and J. Clerk Maxwell experimented upon the electromotive force; Ayrton and Perry operated upon the electrostatic capacity. The extreme range of velocity in the various results was about 10%; the mean of all the results appear to correspond precisely with the velocity of light. The meaning of this accordance may be explained as follows: Suppose two parallel plain surfaces, each charged with a unit of positive electricity and placed at unit of distance; they will repel each other with a unit of force. Now suppose that they are both set in motion in the same direction, but remaining parallel and at the same distance; they will produce the effects of two parallel currents of the same kind and will exert a mutual attraction which will increase with the velocity of motion. It is possible to conceive of a velocity such that the attraction resulting from the motion will exactly counterbalance the repulsion which arises from the similitude of electricity; this velocity is precisely that of light.—*La Lumiere Electrique.*

A NEW MALARIA PARASITE.—Prof. Laveran, of the medical school of Valde-Grase, has just published a work describing what he considers to be a new parasite which he has found in the blood of persons affected with malarial fever. A notice of his discovery was communicated to the Academy of Medicine so long ago as November, 1880, but it seems to have attracted little attention, being thought to be simply one of the numerous announcements made of late years, of the discovery of the cause of malaria, which prove in the end to have no foundation. The organism described by Prof. Laveran is a minute cell, in general appearance somewhat like a white blood corpuscle, and having like it amœboid movements. He considers it to be animal rather than vegetable in character, but for this there seem to be no sufficient grounds. The matter is one of great importance and we shall look with interest to see what the forthcoming report by Dr. Sternberg of the army, to the National Board of Health upon the supposed causes of malaria, may contain in regard to the claims of Prof. Laveran.

THE NEW HYDRO-CARBON to which we have several times alluded in these columns—the discovery of a Frenchman, and which possess many extraordinary and valuable qualities, still continues to attract the attention of scientists. It boils at 100° Fahr., gives a brilliant white light, unaccompanied by heat, and the slightest puff of wind will extinguish it in case of accidental ignition. The corner of a pocket-handkerchief or even the finger can be dipped into it, lighted and used as a temporary torch, without danger of injury. Owing to the cold produced by the rapid evaporation of the liquid, it is thought possible to make one finger serve as a taper, while sealing a letter say with the others.

A NEW mountain pass has just been discovered through the Bitter Root range of mountains. This pass presents a most excellent way for the locomotive, the maximum altitude of which is less than 4,500 ft., with approaches from both east and west upon a grade of less than 65 ft. per mile. There is no danger of snow slides. There are large quantities of the best class of timber along the route, which follows water courses nearly the whole distance from Lewiston to the summit of the pass. The discovery is considered a very important one.

SHEEP AND CATTLE VACCINATION.—M. Pasteur, who has been patiently continuing his experiments in sheep and cattle vaccination, has now announced the complete success of the work, which he has been carrying on on a large scale at a farm near Melun, France; and he believes that he has obtained a process by means of which sheep and cattle can be made wholly secure against some of the most dangerous and destructive class of maladies to which they are subject.

ELECTRIC MOTIVE POWER FROM STREET CARS. Experiments have been made in Paris to drive street cars by the use of Faures' electric accumulators. These experiments, thus far, are said to have been quite satisfactory.

Bullion Shipments.

We qnote shipments since onr last, and sball be pleased to receive fnrther reports:

Horn Silver, September 29th, $7,500; Bullionville, 29th, $7,104; Hananer, 29th, $1,890; Great Basin, 29th, $4,330; Germania, 29th, $2,700; from Silver Reef mines for montb of Septsmber, $76,457; Germania, $6,400; Hananer, 29th, $1,865; Stormont, 29tb, $3,785; Bullion, 29th, $6,785; Northern Belle, 30th, $8,989; Bodie Con., October 3d, $7,244; Star, 3d, $3,869; Silver King, 2d, $21,000; Western, 2d, $15,081.56; Northern Belle, 3d, $6,429.29,; Standard Con., 3d, $19,168; Head Center, 4th, $7,236.

ANTHRACITE COAL.—A dispatch from Victoria, B. C., of tbe 1st inst., says: W. A. Roberts retnrned from Corrichan yesterday, and it is reported that be has discovered two large seams of anthracite coal in the monntains back of Corricban, and tbat a sack full of specimens will arrive to-morrow. The gronnd in which tbe seams are sitnated is owned by a Victoria company.

MINING SHAREHOLDERS' DIRECTORY.

The Mining Share Market.

Stocks have only been fairly active during tbe week. People do not seem to know what to make of] Sierra Nevada, wbether to pnt any faith in it or not. The Virginia *Enterprise* says:

It is quite evident that tbe Sierra Nevada company are now in a fertile and highly mineralized portion of the vein. They are cutting seams and stringers of ore in all directions, and tbey will be greatly ont of luck in case none of these shall lead to snbstantial bodies of ore. Wbere there are feeders tbere must be something to feed, They are in a section where are seen the heaviest croppings on the Comstock, tberefore it is bnt reasonable to expect something below in a place where sucb a great upheaval is to be seen on the snrface. If they have not now fonnd wbat they have been looking for they are not far away from it, for of late the "plot has been rapidly thickening."

The face of tbe east crosscnt from the 2700 station is intensely hot. Hot water pours down from tbe roof and spnrts in from the sides. The thermometer shows a temperatnre of 124 degrees. It is necessary to keep a stream of cold water continually playing upon the men at tbe drill, and every piece of iron and stecl becomes so hot as to give pain to the band tbat grasps it. Yet, nnder all tbese disadvantages, pretty fair progress is being made. In order as soon as possible to get air throngb this part of the mine, the west drift from the 2700 station of tbe joint Sierra Nevada and Union Con. winze is being pnsbed ahead as fast as powder and mnscle can send it.

This will be a very important connection, as it will allow of the resnmption of exploring operations at tbe winze and otber important points.

The bonanza mines are now fast cooling off. Tbe new snction fan is doing good work. Operations have been resnmed at most of tbe important points, and soon all will be going on as nsual.

At the middle mines matters are at present at a stand on acconnt of beat, but arrangements will soon be made whereby operations may be resumed at tbe leading points. It is expected that tbe extraction of ore from tbe 1640 level of the Savage will soon be commenced.

THROUGH the columns of tbe *Sun*, parties in New York are proposing to organize a colony to go to California or some Southern State. One writer says: "I send my address, with a view of organizing a colony to go ont next spring and take np a good location either in northern Georgia or sontbern California, or elsewbere, as shall be voted. The Anabeim colony from San Francisco bas been conspicuonsly a success, and there is an nnbonnded field for many such colonies."

BONANZA SUIT.—Metcalf Pratt has commenced suit in the District Court against tbe California mining company for the recovery of three-twentietbs of $30,600,000. The p'aintiff alleges tbat in common witb Jas. Walsh, Jos. Woodwortb, J. W. Hastings and Geo. Wilson, be was in possession of one-fourth of the ground oow known as belonging to tbe California mining company in 1859; that tbe interest of plaintiff was one-fifth; that be subsequently sold one-twentieth of five one-bnndredths of tbe ground, and that he still holds three-twentieths of fifteen one-bundredths of one-fourth of the grond. The complaint goes on to state that tbe California mining company has taken out and mined ores to tbe value of $30,000,000 from the ground in question, and tbat he (tbe plaintiff) bas never received his proportion of this amount nor any part of it. He now invokes the power of the law to compel an accontting "in whatsoever sum may be fonnd dne." The papers in the snit were filed witb the County Clerk by Lewis & Deal, attorneys for the plaintiff, on the 24th inst.—*Territorial Enterprise.*

AN ACCIDENTAL RICH STRIKE.—We see by tbe Wood River *Miner* that the latest "rush" is to the North Fork, about 15 miles above Ketchnm, where a ledge 2½ ft. wide, of milling ore that assays np in the thousands, was discovered about 10 days ago. The discovery purely accidental. A prospector slipped from a ledge of overhanging rock into the water. In crawling on to the bank, he saw native silver and copper stains protrnding from a crevice. A few minutes' work proved the existence of a ledge. Several "extensions" of the find are already recorded.

THE debt statement shows a decrease of the public debt dnring Septemher of $17,483,641. The casb in the Treasury is $250,686,547; gold certificates, $5,248,920; silver certificates, $64,-149,910; certi6cates of deposit outstanding, $8,-315,000; fnnding certificates, $636,950; legal tenders ontstanding, $346,681.016; fractional currency outstanding, $7,098,506.

THE family of Samnel Hamlin of Yuba City partook rather freely of new almonds tbe other day, and all the family, except the father, were taken violently ill, and were only relieved by vomiting and purging. Their experience may be a warning to others witb reference to eating undried almonds.

MESSRS. FARNHAM & GROVES, owners in tbe rich Rainbow quartz mine, visited Downieville lately. Over $200,000 has already been taken from this mine with a hand mortar.

THE antimony mine in tbe McCleod district, San Bsnito is doing well.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

MEDIAN.—Amador *Ledger*, Oct. 1: The shaft is down 100 ft, with a ledge 6 ft in width at the bottom. Not a doubt is entertained as to the paying character of the ore. The owners have sent for a patent whim from San Francisco to facilitate the hoisting of rock. This was shipped last Friday, and has probably reached its destination ere this. The 10-stamp mill of the Talisman, close by, has been leased, and will immediately be put in order. By the 10th of October it is expected to have the mill in running order, when employment will be given to 8 or 10 men. The Median is between the Keystone and Spring Hill mines, and is regarded in mining circles as one of the most promising properties in the county.

VOLCANO.—Cor. *Dispatch*, Oct. 1: Mining at the present time is dull, on account of the scarcity of water. However, prospecting is still being pushed ahead with vigor, and many have fully realized their most sanguine expectations. Mr. Jacob Grieshack has been engaged in mining of late. He is now running a tunnel near the Pioneer district, and has struck some very rich rock. Mr. McQuade is still continuing to extract very rich rock from his mine. The Modoc mine is looking well, and is having some very good ore crushed at Mace's mill. At the present time the Golden Gate sinking is progressing nicely, and the well-known Downs mine is making necessary preparations for the winter. Mr. Stewart's mine is yielding fine looking rock, and we think he will realize a handsome "clean-up." His mill on the Mokelumne river near his mine is running regularly. The tunnel company is making preparations for the winter, and when we can have a full supply of water to work the different mines you may expect to hear of good results.

CALAVERAS.

THE CORRAL FLAT MINE.—Calaveras *Chronicle*: About half-past one o'clock Wednesday morning, the men at work in the Corral Flat mine tapped an immense body of water. The old works in the upper part of the flat were known to be full of water, which was confined to that locality by a pillar of gravel extending across the flat. Aware of the existence of this body of water, and it being the intention from the beginning to drain it, as the drift was advanced through this body of gravel, drill holes were made in the face of the drift to give timely warning of their nearness to this body of water. While the men were at work they observed water issuing from the side of the drift near where they were working. The flow of water increasing, the men beat a hasty retreat, and not any too soon. By daylight the water had risen about 80 ft in the main shaft, being within about 50 ft of the top. Shortly after the shaft began to fill, the pump ceased to work, owing doubtless to the accumulation of mud at the bottom.

EL DORADO.

MINING IMPROVEMENTS.—*Mountain Democrat*, Sept. 27: A large and heavy 40 inch tubular boiler passed through town last Wednesday, en route for the Lyon gravel mine at Prospect Flat, where it is to be devoted to pumping and hoisting purposes on the new incline.

MARIPOSA.

THE MINES.—Mariposa *Gazette*, Oct. 1: The mines in this section are looming up once more, and the gloomy past is being foreshadowed by an eventful period in mining interest. A quantity of rock has been taken from the Bower Cave mine to the quartz crushing mill of Mr. Mast at the Martin Walling mine, which is said to prospect well.

MAJOR WILBURN has bonded his mine, called the "Kate Kearney," to two gentlemen in San Francisco for a handsome sum. They evidently mean business, for they have already employed Joe Williams and others to work in the mine. Joe Williams worked in this mine years ago, and he says it is rich. The Major is deserving of success, for he has labored upon and guarded this mine for years. The vein which is traced from the McKee mine to the Major's is all taken up. A brother of Judge Cuttings, of Chinese Camp, is here, and thinks he has a good prospect in quartz. Also, a Mr. Evans and Ham Coward are here taking a peop at quartz. Billy Tisdale is getting out some excellent ore, which Mr. Mast promises to crush for him. Phil Coulter is also getting out some good rock not far from there.

FRANK HALSTED's brother passed here a few days ago. He had a specimen of silver ore taken from a locality but few miles distant. Some rock that was taken from the Marble Spring mine and sent below assays hig.

NEVADA.

GOOD LUCK.—Nevada *Transcript*, Oct. 2: Friday night the miners working in the north crosscut of the Champion, 70 ft from the main tunnel and 1,653 ft into the ridge, struck a splendid body of ore. Shortly before noon yesterday they had advanced into the ledge a distance of 4 ft, and had not passed through it. The quartz possesses the same general characteristics as that found in the Providence. The great hight of the ridge will enable 400 ft of backs to be obtained. It is 5 years since the Champion Co. began prospecting there, and during that time they have had an expense averaging nearly $3,000 a year. In order to develop the ground it was found necessary to run a drain tunnel, which is now in over 1,600 ft through hard rock, and is one of the finest pieces of work of the kind in the State. The development made Friday night is of a character to indicate that the mine will soon be on a paying basis, and thus reimburse the stockholders for their outlay and perseverance.

ROUND MOUNTAIN DRIFT MINE.—*Transcript*, Oct. 2: The Round Mountain Drift mining company of this district has abandoned its old tunnel, excepting so far as to take out the gravel in sight. From the Yuba side of the ridge they are running into the mountain, being now in about 00 ft, where a stratum of gravel is encountered. This development is regarded as an encouraging indication that the new tunnel is going in the right direction to reach the main channel.

STRUCK A GOOD LEDGE.—John Schmidt and Charlie Gallagher, who have been prospecting recently near Monroe's ranch on the Blue Tent road, are inclined to think they have found a pretty good claim. They have taken out about 12 tons of ore from a ledge they struck, and will have it milled this week.

GOT A GOOD PROSPECT.—The Eagle quartz mine out on Gallows flat, near the Masonic cemetery, has struck a good prospect. We are glad it is so, because if anyone deserves good luck, that same is Uncle Billy Smith, the owner of the claim.

CANADA HILL.—*Transcript*, Sept. 30: The owners of the Enright ground propose to carry on both quartz and gravel mining in their claim this winter. They anticipate taking out considerable gold. Sam. Johnson has bought of Mr. Cranston a quarter interest in the Keith & Ahern quartz claim, on which hoisting works have recently been erected. This winter Hamilton McCormick proposes to run a tunnel for the ledge on the upper portion of his property. He recently took out through the incline 55 tons of ore that is stated to have paid over $50 a ton by the milling process. Nivens & Sharp, who by the way have one of the best prospects in that locality, are extending their lower tunnel along the ledge in the direction of the shaft. When they reach it, they will have over 200 ft of backs. The tunnel of the Nevada claim is being pushed forward by night and day, two shifts of men working. It has now followed the ledge about 70 ft, and the face shows well in galena and sulphurets. The owners propose to put up a mill as soon as they get the developments sufficiently advanced, which will probably be next spring.

MORE CAPITAL BEING INVESTED.—Grass Valley *Union*, Oct. 2: It is becoming more evident every day that Eastern people have faith in the permanency of the mines of

Grass Valley district. The Menlo mining company, a New York corporation, has begun very active operations here. Another company has been organized, under the laws of the State of Maine, to develop the Battle mine, near Randolph flat. Also that a New York company has bonded the Allison Ranch mine.

SIERRA.

RICH GRAVEL.—*Mountain Messenger*, Sept. 30: The Bald Mt. Ex. Co. completed their preparations for bringing down water from the Pliocene shaft last week, and 10 inches is steadily flowing into their reservoir at Forest City. In less than a week's time near 50 ounces of large sized nuggets and coarse gold have been sluiced out from the upper dump. There are 800 cartloads of gravel in the lower dump, a large portion of which is as rich, if not more so, than the best rolled out of the noted Bald Mountain. The gold is 950 fine, and worth $19 clear per ounce. Soon as the lengthy run of sluices are finished the lower dump will be cleared; and when the new iron air pipe is all received and put up in the main tunnel, 3,600 ft to the incline and gangways, the main tunnel will be turned up the ridge through the center of the channel, and gangways run to the right and left, affording constant employment to a large force of men, materially adding to the prosperity of Forest City and begin in earnest the working of the river of gold that has been demonstrated to run from the Savage and upper ridge down through the Extension and Bald Mountain to Forest City. Thus far over $3,000 has been taken out. Total assessments to date about $45,000. The lucky stockholders are showered with congratulations, and their prospect of having one of, if not *the*, richest gravel mine on the coast is as bright and promising as the golden dreams of the veteran pioneers of '49. In the rich bed of the Yuba, above Jersey bridge, that yielded from 40 to 60 pounds a day to the claim of 60 ft, at that time allowed by law for each location. Next year many locations farther up the ridge will be thoroughly developed, and are backed with ample capital.

SIERRA CITY.—Eureka Con. are still running through bedrock. Main tunnel is in about 500 ft, all but 50 ft of hard cemented gravel. Hidden Treasure Quartz M. Co., Loganville, started work last week. About 14 men will be employed. A 10-stamp mill will be put up this fall. Ore assays from $25 to $200. Last Chance Co. have their main tunnel in fine appearing blue quartz gravel, and are sinking from their main tunnel. The bedrock is pitching and fine gold is found in all the gravel prospected. The Colombo Quartz M. Co. intend running a tunnel in to reach their ledge. One thousand dollars has been expended on this property. One hundred and seventy ft of tunnel, through slate rock; rich quartz in shaft, 31 ft deep; water has forced temporary stoppage of work; all the timber is claimed from the Sierra Buttes' line to the river. Blue Gravel Co. are in 600 ft with their main tunnel. Gravel still appears well, occasionally prospecting with fine gold. No idea of the nearness of bedrock. A shaft is to be raised for air. One Thousand and One have their main tunnel in 950 ft, and are confident of striking pay with their shaft, expected to reach bedrock 16 or 20 ft below the main tunnel, 50 ft this side of the face.

PORT WINE.—Liberty & Co. are busily engaged in repairing their ditches and reservoirs for the coming season, with great anticipations. The Queen and Union are not doing much at present. The Ohio, at Wahoo, is paying very rich. Last week $1,200 was taken out. If this continues the claim will be one of the richest. Twenty men are working. Quite a number of new buildings have been constructed within the past five months, and if times continue thus prosperous, at the end of the year there will be a little town.

THE Sierra Buttes Quartz M. Co. have started tunnel, No. 9, just below the Downieville stage road, near Sierra City. The men employed in Nos. 8 and 9 reside in town, materially contributing to its prosperity. As soon as needed Burleigh drills will be used in No. 9, to be run about a mile to reach the pay ledge northwest of the Sierra Buttes. On the completion of this new enterprise and mills are put up at the lower end of the city, on the ground lately owned by Jno. Kane, this will be one of the most prosperous and liveliest mining camps in these rich gold regions.

ALLEGHANY.—The resumption of operations at the Golden Gate mine near Alleghany is adding greatly to the business interest of that section. Supt. T. Burke has a full crew of first-class men at work and is pushing developments ahead rapidly. The new hoisting and pumping machinery works smoothly. Four Fruc concentrators are being placed in the mill, which will start up in a few days and run regularly. The Golden Gate is in the same locality as the famous Rainbow mine, and we should not be surprised to hear before many weeks that Supt. Burke had uncovered a bonanza like unto the Rainbow's last one. Even should he not do so his careful and economical management ought to make the Golden Gate pan out well with the average gold-bearing rock of which it contains large quantities.

THE Sierra Buttes Quartz M. Co. stopped all their mills last Monday to afford their employees an opportunity to attend the funeral ceremonies of the late President Garfield, at Sierra City.

THE Hidden Treasure quartz ledge, at Loganville, is steadily growing richer as the work of development progresses.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.— On the 2700 level, the joint Union Con. east drift has been extended 18 ft., and the west drift on the same level 23 ft.

OPHIR.—The large fan over the Con. Virginia shaft is in successful operation and is gradually cooling off the southern portion of the mine. We shall be able to resume work jointly with the California Co. during the coming week.

YELLOW JACKET.—The north lateral drift on the 3000 level was run 38 ft; present length of same 288 ft from the switch. No change in the character of the ground. The north lateral on the 2828 level was extended 20 ft, making the present length 108 ft from the north winze.

NEW WELLS FARGO.—The south lateral drift on the 500 level is now in a distance of 50 ft. The formation still looks well.

UNION SHAFT.—Repairing the drift on the 1600 level to the Sutro tunnel connection; also, cutting out a hoh-pit at the 2600 station.

UTAH.—We are now engaged in repairing the incline. This work has been rendered necessary by the breaking of three sets of timbers below the 1300 level.

CON. VIRGINIA.—The suction fan is working successfully and cooling off the lower levels, which will enable us to resume work at the different points during the coming week.

CALIFORNIA.—The suction fan is running successfully and cooling off the lower levels, which will enable us to resume work at the different points during the coming week.

MEXICAN.—The joint Union Con. east winze on the 2500 level has been sunk and timbered 7 ft. The joint Ophir east drift on the 2000 level has been extended 36 ft.

UNION CON.—The joint Sierra Nevada east drift on the 700 level has been extended 18 ft. The joint west drift on the same level has been advanced 28 ft. On the 2500 level, the joint Mexican east winze has been sunk and timbered 7 ft.

CON. IMPERIAL.—Are putting in air pipe in Imperial and Alpha joint winze, which work is now nearly completed. Are puttinghlower in position at our south station, 2810 level, preparatory to cleaning out cross-cuts on that level.

ANDES.—During the past week drift from winze was advanced 10 ft. There is still some water coming from the face of the drift, which keeps work back a great deal. It is now slacking off, and are in hopes it may give out altogether soon.

OVERMAN.—South drift, 2275 level, has been exteuded 32 ft. In north drift we have put in 7 sets of timbers and cut 445 ft of drain.

EUREKA DISTRICT.

A BUSY PLACE.—Eureka *Sentinel*, Sept. 20: The Geddes & Bertrand mine is one of the liveliest places at the present time in these parts. There is a large force of men employed, and everything is bustle and activity. A boarding house capable of accommodating 100 men is being erected for the company. Grading is going forward for the new works, which are to be immense, the masonry for the foundation alone costing $30,000. The owners of the property have undertaken improvements which must necessarily cost several hundred thousand dollars. There is plenty of rich ore in the mine to justify the outlay. It will not be long until the Geddes & Bertrand is recognized as one of the great mining properties of Eastern Nevada.

GRANTSVILLE DISTRICT.

ALEXANDER.—Grantsville *Bonanza*, Oct. 2: Operations at the company's works have progressed satisfactorily, showing good results both in the mining and milling of ores during the week ending this date. The Alexander stopes show quite an improvement since last report. The chloride stope between levels No. 4 and 5, is getting larger and richer as developments progress. The stopes on No. 6 level, east and west of incline, look well and are turning out plenty of good ore.

THE BROOKLYN.—In the Brooklyn the west drift, No. 3 level, was advanced 28 ft since last report, making the total length 142 ft, the face of which shows good indications of nearing the No. 2 ore body. The stopes on No. 1 and 2 levels continue to look well and produce a high grade of ore.

LEWIS DISTRICT.

THE NEW MILL.—Grantsville *Bonanza*, Oct. 2: From A. J. Franklin, who recently visited Lewis district, Lander county, we learn that the new 40-stamp mill is rapidly approaching completion; all the work in and about it is being done in a thorough and systematic manner under the supervision of Mr. John P. Courter. Mr. Franklin considers it one of the best arranged and most commodious mills he ever saw, everything being so fixed as to render it as labor saving as possible. He also thinks that Lewis is destined to become a flourishing camp and an extensive shipper of bullion.

SAFFORD DISTRICT.

PROSPECTS.—Cor. Eureka *Sentinel*: The Contention, and by the way a proper adaptation of the mine, as it has proven a bone of contention ever since its discovery, looks about as usual. The bond on the same having expired a few weeks ago, the owners have concluded to try it themselves a while; although I would suggest that they allow some one with capital to develop it for them; in fact, this is the only present serious detriment to the camp, as simple post holes, in which you could not even bury your head are held at fabulous figures. It appears to be a "dog in the manger" business, and to a man up a tree it looks as though some one was trying to keep capital away from the district. The Belcher, Albert, Illinois, Eureka, Bull's Head and Good Luck appear about the same, nothing having been done worthy of mention. The Pocohontas, a valuable piece of ground adjoining the Contention and Illinois, owned by Molinelli and Smith of your city, and which must certainly sell for big figures if present developments hold out, has been much sought after by parties who are always a day too late, and after having been jumped and worked several times, it has been relinquished as often again to its proper owners, who feel thankful for the amount of work performed on the same, and at no expense to them. Mr. Rickard, formerly superintendent of the Richmond, has located a water ditch and mill site, and it appears to me that if he builds a mill here all the mines must become tributers to it, as the fall is so slight that it will only permit the working of one mill in this vicinity. It will prove a veritable bonanza to him if the district holds out. It is a strange coincidence that, although people coming here leave at first with a poor impression of the district, they return the second time to leave with more favorable opinions.

TAYLOR DISTRICT.

LOOKING UP.—White Pine *News*, Oct. 1. From W. C. Love, Esq., who returned a few days ago from a trip through the Schell Creek range, we learn that the Monitor mine at Taylor district is looking fine. The mill at Steptoe creek was started up last week and was doing good work. At the mine there is plenty of ore to keep the mill running for months, and they have a large reserve to fall back on. Monday morning they took out their first bar of bullion weighing 1,020 6-10 ounces valued at $1,204.74. The ore worked up to 85% and the bullion was 913 fine. Other bars will follow in rapid succession. Mr. Love tells us he has seen no more favorable mining property in this end of the State than the Monitor, and he considers the chances for its owners—Messrs. Lyons, Briggs and McGill—for realizing snug fortunes almost a certainty.

ARIZONA.

GLOBE DISTRICT.—*Chronicle*, Sept. 20: Through the courtesy of Supt. Spence, of the Hoosier copper mine, we were shown through this property a few days ago, and found the work of development going steadily ahead. The vastness of the ledge is proven by the numerous cuts and openings on the surface, to be a continuous vein of high grade copper ore, and second to none in the district. The shaft, which is entirely in ore, has reached a depth of 25 ft, and from it a drift has been started, which was in about 10 ft when we visited the property. It is all in good ore, and the crosscut which is being made south from the shaft has developed a width of 22 ft already, and from the surface cuts on the ledge, we feel safe in stating that it will be found fully 60 ft between the walls. As development progresses, the ore is becoming more solid and of a higher grade than formerly. The dump presents a very handsome appearance, with its 350 tons of first-class ore, and from the present showing of the mine and the immense body of ore in sight, we shall not be surprised to see the erection of a 30-ton smelter commenced at an early day. The Hoosier may safely be classed as the leading copper mines of Arizona, and its ore, averaging from 30% to 35% copper, be adding materially to the output of bullion from this district.

OLD DOMINION.—The long expected machinery for hoisting works and smelters for this property has at last reached the mines, and a large force of men are employed in the erection of the same.

CARRIS.—The smelter belonging to this property was steamed up on Tuesday morning, since which time there has been a continual outpouring of fine copper, and the bars are being piled up like cordwood.

A QUIET WEEK.—Tombstone *Epitaph*, Oct. 2: The only event of special interest during last week, was the enjoining Head Center by the Western M. Co. This step had been expected in mining circles for several months, therefore it did not create the surprise that it otherwise would have done.

SULPHURET.—Notwithstanding the present work on this mine it is more particularly designed to obtain a large water supply for our mines, and mills to be built at the mines, the same work will open up the mine to a very great depth, and is, therefore, of the utmost importance to the district. The flow of water has steadily increased since sinking began, and, notwithstanding but about 20 ft has been made, the increase has been at the rate of 1,000 gallons per foot—the flow now being 85,000 gallons every 24 hours. The shaft where begun anew is being timbered with square sets, the timbers used being 8x10. If the water continues to increase for the next 50 ft as it has for the 20 ft already sunk, the present machinery will have to be discarded and a Cornish pump substituted.

ANCHOR.—Tunnel in 135 ft, having cut and passed two veins, the one 2 ft and the other 3 ft wide, both carrying medium grade ore, have now come into a compact lime, which will probably continue to the main ledge, upon which the incline was sunk.

TOMBSTONE M. & M. Co.—The mines are all looking well and yielding the usual amount of ore. They sent 100 tons of ore to the mills from the West Side, which all came from development work during the month. The mills are running at their full capacity. Monthly output, 3,240 tons.

CONTENTION—Two new shafts on the north end of the mine have been commenced since our last report. There is nothing new to report above the 500 level. They have struck good ore on both the 500 and 600 levels, but as yet have not determined its extent. The various stopes and breasts of ore look as well as heretofore, and the usual quantity is raised and sent to the mill daily. The monthly output is 2,400 tons.

VIZINA CON.—The shaft is down 408 ft. The bottom is in a soft talcose formation that fills the entire shaft. This formation has already been the harbinger of ore in this mine. A strike of ore in this shaft will be hailed with applause by the whole community, for the reason that in the limestone formation of this portion of the district, the question has been, Will the ore go down? The various stopes and breasts are looking well and could, without exertion, be drawn on for $100,000 per month if necessary. Output for the month, 620 tons.

GRAND CENTRAL.—The old shaft is down 500 ft, and the station for that level is nearly completed. The new shaft is down 65 ft below the 200 level, and going ahead at the rate of 5 ft a day. The stopes are looking as well as heretofore. The monthly output is 2,700 tons.

FLORA MORRISON.—The mine is looking as well as heretofore. No more is being stoped out than is absolutely necessary to continue the exploration work.

HEAD CENTER.—Everything moving along smoothly around the mine. No work is being done in that part of this mine in controversy. Monthly output, 900 tons.

INGERSOLL.—The mine continues to look and yield well. Preparations are being made to mill a portion or the whole of the large dump of ore now out, which cannot be far from 1,500 tons. Monthly output about 200 tons.

STONEWALL.—The mine continues to yield as well as heretofore. Monthly output, 200 tons

COLORADO.

WILLIAM'S FORK.—*Register-Call*, Sept. 30: Yesterday the mining reporter met Mr. J. W. Dripps, who had just returned from the mines on William's Fork, Grand county. Dr. Dripps was well pleased with the outlook of the veins he visited, but claims that mining in that locality is in its infancy; that sampling works are badly needed in the new camp, and without them but little progress can be made. The work of development goes on, the ore extracted from the several lodes being piled up. A few sample lots have been transported to Georgetown with flattering results. Here is a fine field for the investment of capital in the erection of sampling works. They will pay the investors in them, besides assisting the miners to realize upon their labor, and thereby assist further development

DAKOTA.

THE COLUMBIA MILL.—Wood River *Miner*, Sept. 30: About noon to-day two 8-yoke ox teams, drawing immense pieces of machinery, came toiling slowly into town. The cry was raised that it was our new smelters, but upon investigation it was ascertained to be part of the large stamp mill of the Columbia and Beaver companies at Sawtooth. The freighters, Messrs. Darby and Coe, informed the *Miner* that they had on the boiler, roasters, fly-wheel, pans and shoes of the mill, weighing 28,000 lbs, and that the remainder of the mill will be in a few days. The machinery was manufactured at the Pacific Iron works, San Francisco, and left Kelton September 5th. It is expected that the mill be in operation this fall and run through the winter.

A FEW prospectors with their pack animals passed through town this week on their way to the south for the winter. The greater portion of those in the country have claims sufficiently rich to induce them to remain here during the cold season. All or nearly all of these claims will be developed another year, and put into a shape for selling.

IDAHO.

WOOD RIVER SMELTER.—*Miner*, Sept. 30: The Wood River Co.'s smelter, near Hailey, is running smoothly, and smelting the usual 10 to 15 tons of ore per day. Arrangements have been made for ore enough for a 20 days' run, and Mr. Wolters says that there is ore enough on the dumps in the various gulches and ravines roundabout to keep it running at least 3 months longer, if the miners will only sell their ores. The smelter now returns from 92% to 93% of the silver contained in the ores. This is 2% to 3% better than can be done in Salt Lake. The Philadelphia Co.'s smelter at Ketchum is about ready to start for a two months' run, during which it will reduce about 2,000 tons of ore. Of this quantity about 1,000 tons are already at the smelter, or on the dumps of the company's mine; 500 tons more will be extracted from those mines, and 500 tons of "custom" ore will be purchased. About the 1st of December the smelter will shut down until next April. The smelter being erected at Bellevue by E. A. Martin is also about ready. It will start up on ore from the Mundey mine, and between that, the Queen Victoria and the Minnie Moore will doubtless run until snow flies.

NATIVE SILVER.—The vein in the Mayflower and Jay Gould mines is opening up magnificently. Recently, in sinking the shaft in Mayflower ground, near the Jay Gould line, the vein widened from 6 inches to 3½ ft in sinking about 15 ft. The value of the ore also improved wonderfully, the seams in the galena being filled with wire silver. Some specimens taken out showed fully 25 cents worth of native silver. This is said to be the first time in the history of mining where native silver has been found in galena.

ITEMS.—*Democratic Times*, Sept. 30: Winter preparations are in order. Sturgis, Beckuer & Co. are still engaged in drifting on Forest creek, with favorable results. Gus. Pfeil, of Gali's creek, reports some mining still going on there, and that general preparations for winter are being made. John Cimhorsky, who has been at work on the Beaver Cinnabar Co.'s claim on Beaver creek, reports flattering prospects. Wm. Borgman last Tuesday showed us a fine nugget of gold taken out by Walter Simmons at Silver creek some time since. It weighed $102, but contained some quartz. J. F. Salmon, superintendent of the Josephine mining company, made a small test run on their quartz a short time ago, and was so encouraged that he is taking out more quartz. T. J Critzer, superintendent of the Steam Beer mine at Leland, has been making extensive improvements on their mining claims, and will be better prepared than ever to make a good run next Winter. Jas. Hansen, foreman of the Blue Gravel mine at Galice creek, is in town. From him we learn that winter preparations will soon be commenced in that camp. Work on Green Bros.' tunnel is progressing satisfactorily. Henry Klippel, Esq., returned from Squaw lake Friday evening. He finds arrangements for replacing the bulkheads in Squaw lake, and a number of men are now engaged in the work. The repairing of the ditch will also be completed at once.

PUMP.—Idaho *World*, Sept. 27: The Elmira Co. are rigging a steam pump to suck the water out of the lower level of the Crown Point. The water will be conveyed through the lower and main tunnel, 35 ft below which work is now being carried on. A three-foot seam of bluish-colored ore was struck the other day in the drift running west from the 75 level in the Sub Rosa. It is the same character of ore that was mined several years ago near the surface, and 600 tons of which milled between $25 and $30 per ton. The ore of this last strike will turn out about $20 per ton, judging from tests made in a hand mortar.

MONTANA.

ALBION.—Helena *Independent*, Sept. 20: The Albion mine, of the Bald butte group, owned by Chumasero, Chadwick & Tatem, which for a time was quiet, is now again active. At a depth of 100 ft levels have been run 150 ft along the vein disclosing a body of ore averaging about 8 ft in width, and it is estimated that developments have thrown in sight at present nearly if not quite 3,000 tons of the ore, which is safe to average at about $30 gold per ton. A contract has just been made with Messrs. Cotter & Hickey for the use of their Mount Pleasant mill for a run of 300 tons of the ore, 60 of which are now on the dump.

IRON AGE.—Mr. Courtwright, the well-known wheelwright, has offered to erect a 10-stamp mill on the Iron Age mine, and run it 2 years on the ore product, taking pay for the mill during that time out of the quartz, and allowing the owners to take the entire property afterwards, free from any obligation to him. Or, if after he has demonstrated the ability of the mine to pay under such conditions, he will allow the owners to take full possession by paying the actual cost of the mill, with a reasonable compensation for his time spent and services rendered in the development of the property.

GLOSTER.—The Boston & Montana's Gloster mine continues to display a remarkable body of ore that increases in value as development progresses, and each run shows an advance in the degree of fineness of the precious metal. The last clean-up of a 14 days' run resulted in 246 ounces of bullion, which netted nearly $3,400, the actual saving per ton in their 10 stamps being just about $15 average per ton for all ore treated since the mill started. The gold has from the run last but one, was stamped .623‰ fine, while the one last made is .631 fine in gold, or the highest grade yet produced from this mine. Fully 40,000 tons of the ore are in sight.

THE ARCTIC MINING AND MILLING CO., of Tama county, Iowa, is actively developing property in Hyora gulch, 2 miles beyond the Alta Montana's Comet mine. The company has 4 locations on what is known as the Silver Brick lode, and it is reported that between walls, 14 ft apart, the ore is solid for the entire distance. They are running a tunnel.

THE Parsell and Edgington mines of Poor Man's gulch, just over the main divide from Virginia creek, are now owned by Messrs. Holter, Sharpe and Floeder. Messrs. Edgington, Parsell, Morrill and Trent having sold their three-fourths interest. These properties have steadily improved in value, as the vein has been exposed until they bid fair to take rank very soon among the established mines in the Territory.

A NEW MINING DISTRICT.—*Inter-Mountain*, Sept. 29: From Mr. James Moffet, who has just returned from the new mining district, discovered by Mr. Frank Bosworth, about 6 miles east of Butte, on the north side of Elk Park, we learn that some 50 locations were made on and near the new find, some of which show pretty good indications. From several assays made on rock from this place the following reports are made: 109.35 ounces silver; 139.75 ounces silver, and 80 ounces silver and $2.50 in gold. The croppings in some cases are very large and the veins show a width of from 1 to 9 ft. The formation is granite and porphyry, and the rock is free milling, with some iron in it.

NEW MEXICO.

COPPER MINE SALE.—*New Southwest*: Sam'l H. Eckles, for the past two or three months, has had the handling of the group of copper mines in the Burros, known as the Colton, Hilton, Boston, St. Louis, Copper Mountain, Emma, Mary, Parker, and Anything, belonging to James M. Yankie, George Parker, James Lullard and one or two others. The mines were located by Charlie Thayer and others several years ago, and considerable money was spent on them at the time, but more recently, assessment work having been neglected, they became subject to re-location, and were taken up by the parties first named. Sometime since Mr. Eckles succeeded in inducing Paschal R. Smith and F. J. Marshall of Denver, to look upon the property favorably, and as a result of his negotiations with these gentlemen, the sale was effected for $150,000. We are reliably informed that it is the intention of the new proprietors to commence active work upon the property without delay, that a smelter of great capacity is to be erected, and that operations will be upon such a scale as to give employment to about 500 men. Of course, as these mines are situated but 18 miles west of Silver City, this must be the point of supply, and the direct and indirect advantages resulting will be enormous.

SMELTERS.—*New Mexican Mining News*: A few more smelters and stamp mills in Socorro will not do the camp any harm. The Torrence mill and the La Joya smelter will never be able to clear all of the dumps in the Socorro mountain alone, and men with no capital but a few hundred tons of rich ore cannot afford to be kept waiting.

THE miners of the Magdalena range are jubilant over the prospect of soon having a smelter on the ground. The machinery is nearly all there and is being rapidly put up. As a natural consequence mining property in that camp has greatly improved.

RISE IN VALUES—The miners in the immediate vicinity of Cerrillos station are beginning to share in the general rise in values which has recently set in throughout the camps in the Cerrillos district. The placers, near this camp have been kept back solely from lack of water and if the dry washer succeeds in dispensing with what has heretofore been indispensable in placer mining, those who are fortunate enough to own claims there will have a fortune on their hands.

RIO HONDO.—The mines at Rio Hondo are among the best in Taos county. This is comparatively a new camp, but the richness of the ore found there has been clearly proven. The Staples claim is one of the best developed, the shaft now being over 100 ft in depth. The ore taken from this lead will run about 200 ounces to the ton, which is very much above the average of that taken from mines which have yielded enormous dividends. There is now considerable expense attendant when shipping the ore to reduction works, those at Pueblo, Col., being the nearest to the camp, which, of course, materially reduces the owners' profits, but this will eventually be obviated by the erection of smelters on the ground.

THE mines of Colfax county are beginning to attract considerable attention from mining men, and the probabilities are that work will at once be begun on a number of them by parties who have command of sufficient means to thoroughly develop them. Several companies have been formed, having for their object the development of some of the best known mines in the county, and are going at the work with a rush, which will materially advance the mining interests of that section of the Territory.

MINERAL HILL.—Cor. Las Vegas *Mining World*, Oct. 1: The Golden Gate camp is located in a most delightful spot, with the Blue Canyon river sweeping by. About 100 yards distant is an immense dyke of granite, which shows itself in the bed of the creek, and extends almost to Gerard's camp, where it suddenly disappears. The first claim you see is the celebrated Carbonate Queen, Mr. Grans, proprietor. The work on this property consists of an incline driven into the mountain slope 65 ft. There are, if I may judge by the number of stakes and monuments I meet with on this side of the hill, several other claims on which scarcely anything has been done to warrant my wasting ink, with the exception of the Little Rena, Messrs. Irvine & Co., owners. This is 30 ft deep, beginning to go under cover. About one mile up the side of an almost perpendicular mountain, you come to the Little Pearl, Arnold & Co., owners. An open cut extends for about 24 ft from the face at present and is composed of float; howlders are to be met with containing arsenical sulphur, green and red sandstone, etc., largely interspersed with mica and oxide of iron. I was informed that some of this float assayed well for silver. Parties who are about to operate in this district should understand that deposits which will prove of value are not to be met with on the surface; such deposits that are formed in and near the surface are caused by displacement. A careful study of this district teaches us that if we wish to find the true deposit we are compelled to search for them in deeper or more settled stratifications.

UTAH.

THE G. K.—*Southern Utah Times*, Oct. 3: The G. K. copper mine, in Beaver Lake district, is now having an air shaft sunk upon it to a depth equal to that of the main shaft with which it will be connected. It is now down to a depth of 40 ft in ore all the way, which assays from 10% to 45% copper. Mr. Cook, the superintendent, thinks the outlook a very favorable one.

HORN SILVER.—We have lying before us a beautiful specimen of high-grade copper ore, and another of gold-bearing quartz taken a few days since out of the lowest depths of the Horn Silver mine.

It is reported that a rich placer mine with no less than 11 quartz leads, all in the same vicinity, has been discovered in Lower California, about 250 miles south of San Diego.

The Entomological Exhibit at the State Fair.

The insect exhibit at the State fair hy Matthew Cooke, State Horticultural officer, was one of the most valuahle educational features of the fair aud was duly appreciated hy the puhlic. Unfortunately it was placed in a dark corner, when it should have heen in the lightest part of the huilding. The *Record-Union* gives a review of the exhihit which will interest those who could not attend the fair:

There is no more attractive exhihit in the entire list, either at the park or pavilion, aud none more suggestive or of more vital importance to the people, than that made hy Matthew Cooke, chief executive officer of the State Horticultural Commission. It is a complete aud exhaustive exhihit, in all the various stages of their existence aud depredations, of the various insect pests which prey upon the fruits, trees aud vines of this State. The exhihit is presented through the aid of a score or more of microscopes, powerful magnifying glasses, etc. These are ranged at conveuient distances from each other aud heueath them are such specimens of the codling moth, phylloxera and a host of similar pests, as can he only examined hy microscopic aid. In additiou is an almost endless array of the "pest" specimens in vials aud jars, with examples of their destructive work in wood, leaf, fruit, berry, etc., aud showing every one of the stages of their existence. These specimens are from all parts of the State, and have heen gathered hy Mr. Cooke with great patience, to enahle him to gain a full knowledge of this branch of entomology, with a view to applying the hest remedies possihle to the extermination of the pests, which have already caused such great loss to fruit and grape growers. Some time ago a number of grammar school hoys here organized a junior Agassiz association, for the study of entomology and the collection of specimens. It proved quite successful. Mr. Cooke was invited hy the hoys to instruct them concerning insect pests, and he readily undertook to do so. He has now utilized this society hy selecting from its membership a number of the young masters, who, wearing the neat hadge of their association, stand hehind the counters, on which are arranged the microscopes and specimens in the exhihit referred to, and, having hecu instructed hy Mr. Cooke, explain to inquirers all needed details of the exhihit. The three days' experience already had, Mr. Cooke certifies, proves that the youths' association is a most desirahle aid in furthering the purposes of the exhihit, and the puhlic has heen greatly convenienced by the politeness and attentions of the hoys. The exhihit is in the lower east hall, in the southeast corner. (This exhihit should have the hest light and location in the huilding, and he on the upper floor.) The space, 30 ft. hy 14 ft., is railed in. In the center is placed tahles, in the form of a hollow parallelogram, 23 ft. hy 7 ft., giving a surface of 104 square ft. On the tahles are arranged 24 microscopes, some of them valuahle instruments, which have heen given hy their owners for use in this exhihit. There are also 36 magnifying glasses of various kinds. To the tahles are fastened hy chains 12 readiug glasses, for use hy those examining specimens. The visitors enter at one end of the tahle and pass to the right, so that there is no trouhle in the passage arouud the tahle. In the microscope and maguifying glasses are placed specimens of the various insects, and on the tahle are various hottles, etc., containing specimens, as follows:

First—The codling moth (*Carpocapsa pomonella*), which has done so much damage in this State aud elsewhere. Specimens of the egg, larva, pupa, and perfect insect (moth). Also pieces of scantling taken from fruit-packing rooms, hark of trees, paper, etc., showing how this pest hihernates.

Secoud—Scale insects (*Aspidiotus perniciosus*), or San Jose scale, which has done so much damage to orchard property in Sauta Clara couuty, aud is uow found in Solano, Yolo and Sau Joaquin. *Aspidiotus rapax*, fouud in apples, pears, etc., in Sauta Cruz and some of the southeru couuties. *Aspidiotus conchiformis*, or common apple scale, fouud in various sections of the State on deciduous fruit trees aud citrus trees. *Aspidiotus aurantii*, or red scale, fouud on citrus trees aud fruits in Los Angelea county, aud also fouud as far uorth aa Marysville. *Aspidiotus convexus*, found ou the fruit in various counties, hut especially on citrus fruit. *Leconium oleæ*, or hlack scale, found throughout the State on citrus aud nearly all kinds of deciduous fruit trees. Accompauying this species are specimens of *Fumago salicina*, or smut, which accompanies the hlack scale and discolore the foliage aud fruit. *Leconium hesperidum*, or soft orauge scale, fouud in every portiou of the State ou citrus treea. *Leconium acericoleo*, or maple scale, found on grapes in Santa Barhara aud eome other couuties. *Icerya purchasi*, or cotton cushiou scale, au Australian importation; fouud in Santa Barhara and Los Angelea; ita food plants are citrus and deciduous treee, abruhs, etc.; this appears to he a very undesirahle visitor, hy the specimeua shown. *Uhleria araucariæ*, or scale of Norfolk ialaud pine; said to he spreadiug very fast. *Diaspis roseæ*, or rose scale, with epecimena ahowing ita serioua epread ou the rasuherry and hlackberry viues. Iu all, 22 apecies of acale iusects are exhihited.

Tretranychus telarium, or red spider, in all its changes or metamorphoais. Specimeus from several couuties.

Caterpillars — *Clisio campa constricta* and *Clisio-campa* aud *Americana orgyie leuceostigma* in all forms—eggs, larvæ, pupæ moths, etc.

Selandria cerasi, or pear slug, with specimens showing its destructive hahits.

Nematis similaris, or saw-fly, destructive to foliage of pear trees early in each season.

Ægeria tipuleforme aud *Chrysobothris femorata*, currant-husb borers; also, specimens of apple-tree borers, etc.

Orauge, lemon, apple, pear, etc., iufested by scale insects aud set under glasses.

Olive branches iufested hy three distiuct species of scale insects. Lemons, from a recent shipment received from Australia, infested by A. *aurantii*, or red scale, aud *Leconium citricola*.

Collectiou of various insects more or less injurious to trees aud fruit, iucluding several species of *Diabrotica*.

The collection of vine pests, etc., is taken charge of hy J. H. Wheeler, Secretary of the State Board of Viticultural Commissiouers. This iucludes phylloxera, vine caterpillars, aud a full display of remedies for their extermination, fully described by Mr. Wheeler.

Friends of the fruit growers—This collectiou of insects is classified as "lady hirds," *coccinella*, *chrysepas*, or lace-winged flies, etc. Iu this division is exhihited a fine collectiou of parasites of the *coccidæ* or scale insects, kiudly loaned hy Alex. Craw, of Los Angeles, of which Mr. Cooke speaks highly. It cousists of syrphus flies, destroyers of plaut lice, lace-wing flies aud various parasites of the hlack scale, soft orange scale, lady bugs, etc. There is also exhihited pump-uozzles, etc., for washiug trees, scrapers, etc., for cleaniug trees. Volumes exhihited of uatural history of insects, etc.

Durability of Redwood.

The geueral desirability of our redwood timher and lumher is hecoming widely known, and is leading to a promising export trade, as we have uoted from time to time in the PRESS. It seems that the durability of the wood iu sitnations whicb lead other woods to quick decay, may he the fouudatiou of a special trade in redwood. At all events, wood of long life uuder adverse couditions is such a desirable thiug to Eastern huilders, that tbey are inquiriug the record of our redwood iu this respect. All wbo bave had to do with it here know very well tbat it has remarkable durability uudergrouud or betweeu wind aud earth. Iu order to preseut Easteru correspoudeuts an object lesson in the soundness of redwood, Fulda Bros., of Spear street, S. F., who are exporters of lumber, have just sent East a piece of oue of the posts which formed the stockade of Fort Ross in Mendocino county, accompanied hy certified statements concerning the history of the specimen, which are of geueral iuterest, and we puhlish copies of them as follows:

Messrs. Fulda Bros., S. F.:—By your request I send you, by the schooner *Euphemia*, a piece of the old stockade at this place. The stockade was huilt hy the Russian Fur Company in 1811. Eight years ago, as the stockade was in my way, I had most of it cut down level with the ground, and the sample which I send you is a piece (about a quarter) of one of the butts of the posts left in the ground. In getting your sample, we only took up one post, and it is about a fair average. As you will see, it is perfectly sound, excepting the sap wood, after being buried for 70 years.—G. W. CALL, Fort Ross, Sept. 13, 1881.

State of California, City and County of San Francisco [ss.]:—I do hershy certify and declare on oath that the piece of redwood lumber referred to in the within statemeot was taksn up by me from the original stockade srected by the Russians in 1811. It was standing huried in the ground, excepting the upper end. The whole piece bsing too heavy, this was split off from the log, it beiog about two ft. thick.—H. BOTORER, Captain schooner *Euphemia*.

Sworn and subscribed hefors me this 14th day of Septsmher, 1881, John E. Hammill, Notary Puhlic.

Here, then, is a piece of a redwood post which has heeu uear the surface of the grouud 70 years. As Mr. Call says in his statemeut, the post was perfectly souud exceptiug the thiu layer of sap wood ou the outside. This had decayed, hut the halance was perfectly souud and as hright-colored aud solid as though it had heeu fresh from the lumher yard. The alternating soaking and dryiug of the ground for 70 years had left uo effect upou it, and it is impossihle to tell how long it would have eudured. Seventy years' duratiou will, however, satiafy the amhition of most moderu builders, aud it would uot he surprising if our redwood should he called for ou account of its durahility, aud a profitable trade arise.

Iu this couuection it is iutereating to meutiou a fact concerning the secoud growth of redwood which Mr. Call of Fort Ross relates. He knows of ehoots from old etumpa which have growu to he three aud four ft. iu diameter in 40 years. This would iudicate reatorative powers in redwood foresta which wonld eusure a future aupply of the timher.

The redwood which is iu demaud here for uudergrouud uae ia what ia kuown hy the lnmhermeu as "hlack heart redwood." It ehowe a dark color wheu cut witb a kuife, the outer layer only becoming "seasoued." "Black heart" is exceediugly heavy; too heavy to float. One who haa ohserved echooner loading at chutes aloug the coast assures us that a post of thie wood which plungea overhoard uever riaes, aud a hoard lingere ou the eurface a moment and theu slowly alides dowu iuto the depths. This is the sort whioh ia sought for in the foundation of our huildings, and uuder hriok walls is believed to be imperishahle,

Timber on the Truckee and Its Tributaries.

The Reno *Gazette* has takeu paius to secure informatiou coucerniug the visihle supply of timher still remaining iu the basiu of the Truckee river aud its trihutaries to meet statemeuts made now and thsu that the timher of that regiou is approaching exhaustiou. It says tbat a stndy of tbe couutry will couvince the most careless observer that tbe ocean of timber houuded on the west hy the Summit, ou tbe east hy the sage hrush valleys of Washoe lake aud the Carsou, ou the uorth hy Sierra valley, aud ou the south by Lake Tahoe, has hardly heeu tapped. It is true that many hillsides have heen deuuded by wood choppers, and large patches cleaued out hy sawmills. It is true that the Comstock has absorbed a thousaud milliou ft. of timher aud lumher, aud the vast desert between here aud Salt Lake bas probahly takeu as much more in the last 20 years, yet there are fields larger thau those drawn upou, that remaiu uutouched, and it is withiu the truth that the great cauyou of the Truokse aud its tributaries would stand a similar draft for 50 years to come. Timher experts, who have heen counsilted hy the writer, estimate that there remaius stauding iu locatious that make it available to market witb very little additions to the preseut facilities over 5,000,000,000, ft. of timher and over 10,000,000 cords of wood. Allowing a daily product of 40,000 ft. of lumher to the mill, for 200 days iu the year—which is a very high estimate of a seasou's ruu,—this would last the mills uow runniug 62½ years. Arouud Lake Tahoe there has hsen an immeuse hody of timher, aud although it has heen cut into very largely, it is still helieved that there is about a thousaud million ft. still staudiug. Hope valley has a large quautity of timher that is uutouched. At the uorth eud of the lake there is a very uice lot of timber that is falling !hefore the axes of Folsom & Marlette's men. Bstweeu Tahoe and the towu of Trnckee there are uearly 500,000,000 ft. that cau he reached by the Truckee Lumber company's works, which are very oomplete, and comprise dams ou the river for floating logs, aud chutes iu tbe mouutaius for trausporting them dowu. On Squaw creek aud other hranches there are large patches that will come iu. On the east side of the Truckee river a number of branches come iu. The first is Martis creek. The mills of Richardson Bros. and McFarland stand iu a hasiu that will turu out over 100,000,000 ft. George Schaeffer has a very fine lot of timher that will keep his mill running for years. He will soon move further up the creek. Juuiper creek, where Burckhalter huilt his railroad, will turn out over 75,000,000 and the road cau carry more from an immense flat ou the head of Martis creek, and from the Tahoe divido. Wicke's country, east of Brouco, is very steep and high, but it has a fine growth. It will likely all he cut for wood aud flumed out. It is very well watered and small flnmes could he swung around over every part of it. It will furuish 200,000 cords of four-foot wood. Betweeu Juniper aud Wicke's creek lies a very rough cauyon, ou Gray's creek that has uearly 50,000,000 ft. of timber. Betweeu Wicke's and Verdi. ou the east side, there is prohahly another 50,000,000 ft. Ou the west side of the Truckee lies the maiu supply. The east side is a narrow ridge, hut the west side rises into the graud range of the Sierra Nevada itself. Coming down the river from Tahoe, the first hreak after leaving the Trnckee lumher compauy's territory is Donuer creek, which heads iu Douuer lake. The timher arouud the lake is pretty well cut out, and there is probahly less thau 10,000,000 ft. in the whole hasiu up to where the road crosses the summit. Ou Trout creek, which comes iu through the towu of Truckee, there are 20,000,000 ft., Alden creek has 60,000,000, Prosser creek 150,000,000, Sage Hen, a trihutary of Little Truckee, 200,000,000.

Ou the Little Truckee aud hranches there will be fouud the vast quantity of 1,000,000,000 ft., hesides 4,000,000 cords of wood. Ahout half of this quautity lies iu a red fir couutry from Webster lake aronnd the high level couutry that crosses the summits west of there, aud it will come this way rather thau seek a market across the rough country between there aud Sacramento valley. In Truckee valley and the divide hetweeu the Little Truckee and Sierra aud Sardiue valleys, auother thousand milliou cau he cut aud ruu out at Boca. From Camp Tweuty to Verdi there muet he 100,000,000, hut it will be more apt to come out as wood thau lumher, as it ie iu a very rough aud dry couutry, aud rather scattered. Dog valley lies hack of Crystal Peak and has excelleut facilities for reaching the track. It will afford hetweeu 50,000,000 and 75,000,000. Such vast figurea as are given ahove afford hut little siguificance to the ordinary reader. A city like Sau Francisco could he huilt out of euch a hody of timber aud it would uever he noticed.

THE Utah & Northeru baa three compauies of eurveyors at work ou the proposed liue hetweeu Bedford and Beutou. The work of the first party extends from Bedford to Prickly Pear; that of the seoond from Prickley Pear to Little Prickly Pear, aud the third party hegins at Little Prickly Pear and works dowu the bank of the Miesouri river. The point at which the Bentou hranoh will diverge from the maiu laud for Heleua will be to Stuhh's Ferry.

Out of Employment.

The dreadful depressiou wbich has fallen upou all kiuds of business iu the hydraulic parts of Nevada connty, is hsing also severely felt in Nevada City, which for many years has beeu a kiud of supply depot for the outer camps. The busiuess man of San Francisco may tbiuk I am exaggerating the coudition of affairs, hut I am uot. Iu fact, I fail for waut of words to give the full extent of the distress tbat is prevailing among the working populatiou, as well as the great demauds that are heing made upou the husiuess people by tbe sufferiug iu their midst. Uuless something is done, aud that quickly, serious results are hound to follow the suspensiou of work in tbe hydraulic mines. The distress I allude to is that which was exbihited to me by those almost dead camps, whose sole support came from tbe hydraulic miues. The towns of North Bloomfield, Columhia Hill, Cherokee Flat, North Sau Juau, Sweetland aud Freuch Corral, pleasautly situated in the mouutaiu valleys, contaiuing finely constructed homes of miuers are, as far as busiuess is concerued, almost dead. Thousauds of meu are out of employmsut, and they and their families are provided with ouly the very extreme uecessaries of life through the geuerosity of those iu better circumstances. All these men have families; hardy, industrious aud willing to work, bnt which they are deprived of through au autocratic assumptiou, aud they are forced to ask of charity, food for their families that their willing hauds would too gladly earu. If the husiuess meu of San Franoisco would only go over the grouud I have the past three days and see for themselves the vast destruction of husiuess that bas come to this sectiou of Nevada county, they would solve the slickens question very quickly. The sad expressions of the pareut at the gloomy outlook have even settled upou the faces of tbe childreu—with these latter there is abundance—if that joy which always exists wheu good cheer is at home. The strong robust mau looks at the home that he has hesn for years making, then glances over the epot where he had earued sufficieut to keep the larder well filled, hefore the adveut of that hateful injunction, and mutters to himself how loug is this to coutiuue? His mind clouded with the thonght that probahly he will he forced to abandou that home for which he had toiled so long and hard, it is fortunats for the taxpayers of this State that these men have a great respect for the laws. I do uot waut it uuderstood that it is the fear of the law that makes them obey the injuuctious whioh bave deprived them of employmeut, for fear is a feeliug they do uot know. Had the same uumber of people heeu throwu out of employmsut iu Peuusylvania and other States, by the same processes of law as have beeu iuvoked hy the Grangers, the whole militia of each of the States would not have heeu ahle to euforce the injuuctious. Aud here I wish to say that uoue of the mines in Nevada county are working, upou whose officers injunctious have heeu served, uotwithstauding what the anti-slickeu papers say to the coutrary. — *Correspondent Nevada Transcript.*

Two or More Veins.

The Commissiouer of the Geueral Laud Office puts the following oonstruction upou Section 2,336, U. S. Statutes, "where two or more veins," etc.:

The uuiform coustructiou placed upou this sectiou is, that the space of intersection meant is determined solely hy the width of intersecting veins, and not the width of the claims.

For instance, the party making the first locatiou is eutitled to all surface grouud and the full extent of the vein included withiu his houudaries, including the space of intersection.

The secoud locator is entitled to the full length of his location, exclusive of the conflicting surface grouud, aud the space of intersectiou of veius.

If the iutersecting veius are respective 10 ft. in width, the space of iutersectiou would be 10 ft. square, and the party locating last would not he entitled under the law to 10 ft. of lode iucluded iu the space of intersoction.

THE GEOLOGICAL CONGRESS.—The *Herald's* Bologne special of the 28th, says: The Geological Congress met to-day iu the Salle Rosseui, which waa adorned with French, Italian and American flags. Among the celehrities preseut are Signor Berti, the Miuister of Agrioulture, who represeuta the Kiug, and the Honorary President, Prof. Zella. After paying a compliment to the eminent scientist, Prof. Hehert, the president of the firat congress held iu Paris, iu 1879, reaigned the chair in favor of Prof. Capelini. The United States is represented hy Prof. James Hall, of Alhany, and Canada, hy the president and secretary of the committee of the Geological Congrese held in Buffalo, iu 1879.

RICH STRIKE IN TIPTOP.—The air is filled with rumora of the uew etrike iu the Tiptop, and we very sincerely hope they may prove true. The authorities do not graut entrauce to the miue, so we have heen unahle to auhstantiate the truth of these rumore fully. Such a development would add a sixth regular dividend paying miue to Arizoua'e list, and would muoh heuefit our city. There is every likelihood that Tiptop is proviugitaelf a valuahlemine.—*Phœnix Herald.*

Taylor District.

Taylor district, in the eastern part of White Pine county, bas been making sometbing of a stir in tho mining world of late. A bright future is predicted for it. The mill of the principal mine has just been started up. Tbe Ward *Reflex* has this to say of the new cnmp:

We took in tbis district Thursday and found 10 men under the direction of Robert Briggs, taking out ore in tbree plnces ou the Monitor. Abont 12 tons of ore are tnken out dnily. Frem the cut in the road six tons were shipped to the mill Wednesday, estimnted to go $400 to tbe ton. Under the road at tbis point tho orc ie 6 or 7 ft. deep. The temptation to dig it out and do without u road is great. From the first cut rnn on tbe east sido of the ravine, horn-silver ore was coming out that only tho Eberhardt could equal in '68-9. Thers is but little stripping to do and they are working it like u farm. Ore bas been found in every instanco wbere a hole has been sunk to tbe depth of u few feet. It ie nothing more nor less than a ledge lying flat on tho ground and slightly covered over. It is yst to be ascertained whetbor it goes dowu or not.

No smnll nmouut of interest has been centered in the success or fniluro of tbe Monitor mill, on Steptoe creek, for the past three or four days, but the agouy is now over. Messrs. Briggs, McGill and Carotbers came over Sunday evening, and from them we learn that tbe mill ie in every eense a success. . On Thursday the pans were chnrged and the water turned on, wbich pnt all the machinery in motion with ease and power to spare. The ore put throngb to start with was of tho lowest grade, pnlp assays going $62 to the ton, which wae worked np to 85%. J. S. Carothers, who is amalgametor for tho time being, assuree ns tbat with richer ore he can work up to 90%. The present rate is exceptionally good. As tbey have plenty of high-grade ore it will not be difficnlt to mnko the mill pay for itself in 30 days, if it is put througb. Taylor will he beard from regulnrly from tbis on tbrougb ber bullion shipments.

A Heavy Cave.

A. Weiser, of Moore's Flat, gives us the particnlars of a disastrous mining accident that ocourred at that place last Saturday night ubout 12 o'clock. The mountain into which the Blue Bank Co. are working caved for a distance beck of 3,000 ft. from the face of the bank as washed, covering the bedrock with debris, bnrying three monitors, all the pipe, tbe tools excepting one hatcbet and n sledge-bammer, a large lot of nails, blocke and otber material; besides filling up the cut a bnndred ft. deep and ruining tbree undercurrents. Mr. Weiser estimates tbat tbe actnal cost of the material tbns lost will not fall far short of $20,000. The Boston, which is tbe adjoining clnim on the west, nlso lost tbree monitors, some of its pipe, and nll its blocks, in addition to otber effects, probably aggregating a value of $10,000.

Tbe men barely bad time to get away after the alarm was sounded, Charlee Keskey who was in tbe tunnel escaping death by almost a miracle. Drift tunnels recently run were closed, bridges across cuts were carried away, and ruin prevailed on every side.

It is said that something like 125 men will be temporarily tbrown ont of employment. Tbe Boston will immediately begin clearing away the fallen mass, und before long will probably he in full operation again. The Blue Bank has months of work before it. Old miners say it will take an expenditure of $200,000 or so to put botb tbe mines in as good a condition ae before tbe cave.—*Nevada Transcript.*

A Nevada Niter Company.—The Carson *Appeal* has the following in regard to niter, a mineral to wbich no one has given any attention until quite recently, tbough it is said to be quite plentiful in many pleces in this State: A. Hebberling, Assistant Assayer of the Mint, returned yesterday morning from Humboldt county, in tbie State, wbere be has been spending a few days at tbe works of tbe Nevada Niter company. Tbe property of tbis company, wbich consists of Gov. Kinkead, Superintendent Cruwford, of tbe Mint, and other well-known citizns of thie place, is situated nbout 25 miles from Lovelock's, the latter being a station on the Central Pacific railroad, and is in Humboldt county near the Churchill lins. The company bas been formed for tbe purpoee of extracting nitrate of eodinm, a deposit of wbicb ie fonnd near tbe earth's surface nt dietancee of from two incbee to two ft. It ie aleo fonnd in crevicee of tbe rocke, and alwaye appearein oryetal form. Nitrate of eodlum ie prepared for the market by diesolving in water and re-crystalizing; and ae pure nitrate of sodium it ie used for the manufacture of nitric acid, eulpburic acid, nitro-glycerine, Hercules powder, common blaeting powder, and other explosivee. Tbe Nevada Niter company bave located eeveral milee in their claim, and it ie their intention to go exteneively into the production of tbe marketable article of nitrate of eodium.

The Wood River (I. T.) *Miner* eaye: W. H. Petitt, Superintendent of the Monarch mine in Atlantu, writee that Atlanta ia looking np. Tbree minee have been eold tbis enmmer, and the money paid. Tbe Tahoma eold for $110,000; tbe Last Chance, witb mill eite, for $25,000; the Paoific, price not stated.

Useful Information.

A Singular Use for Electricity.—Perhaps one of the queerest applicatione of electricity to the useful arts is its employment in the hiving of bees when they swarm. The old fashioned way of accomplishing this interesting feat of domestic economy was, if not absolutely dangerous, at least quite annoying and provoking. German scientists of a practicul disposition conceived the notion of utilizing the electric force to stupify, without injuring, tbo bees for u short period. The plan wns fonnd to work like a charm. It was first tried upon bees that had gatbered upon tress. Whether the clusters were lnrge or small, the result was perfect. The bees fell upon the ground in a trance which admitted of safe handling. The next stage in the experiment wne to capture tbe bees when they were about to swarm. By introducing the ends of two conducting wires into n fully occnpied honeycomb, and turning on tho current for nn instant, the insects were rendered inactive for nbout 30 minutes. Bee-rearing and the producing of bonsy are yearly becoming a greater industry in this country. Parties interested in the business should test the Germun idea of hiving bees by electricity. Tbe chance is not remote that bee proprietors will apply too strong a shock and lose their bees, but tbey will gain in science, which ameliorates all small disasters in this progressive age.

The fusibility of soft solders ie increased by udding bismuth to the composition. An alloy of lead four parts, tin four parts, and bismuth one part, ie easily melted, but thie alloy may itself be soldered with an alloy of lead two perts, of bismuth two parts and tin one part. By adding mercury, n still more fusible solder cun be made. Equal parts of lead, bismutb and mercury, with two parts of tin, will make u composition thut melte at 122° F., or an alloy of tin five parts, lead tbree parts and bismutb three parts, will mult in boiling water. In mixing tbese solders melt tbe least fusible metal first in an iron ladle, tben add the otbere in accordnnce witb tbeir infusibility. To cast stripe of eolder, pour tbe molten metal on a flat surface of etone or metal, drawing the ladle along the wbile to leave a thread of metal of tbe desired substence.

Cement for Leather Belts.—For making cement for leather belts take of common glue and Americau isinglnss equal parts, and place in a glne pot. Add water to cover the whole. Soak 10 bours. Then bring tbe mixture to boiling heat, and add pure tanuin, till tbe whole becomes ropy or like the wbite of eggs. Apply warm. Buff off the grain of the leather where it is to be csmented; rub the joint surfaces solidly togetber; let it dry a few hours, and it is ready for use. If properly put together no rivets will be needed, as the cement ie as strong as tbe leather.

Cleaning Brass.—Make a mixture of one part common nitric acid and one-half part sulpbnric acid in a etone jer; tben place ready a pail of fresb water and a box of sawdust. Dip tbe articles to be cleaned in tbe acid, tben remove them into the water, after which rub them witb sawdust. This immediately changes them to a brilliant color. If tbe brass is greasy it must first be dipped in a etrong solution of potash and soda in warm water. This cuts tbe grease so that the acid bas tbe power to uct. This is a government recipe used in the arsonals.

Test for Linseed Oil.—An excess of crude nitric acid mixed witb a suepected oil, and agitated, will indicate tbe presence of fish oil by tbe dark brown discoloration of the oil which follows. Pure linseed oil under tbe same treatment would be cbanged to a sea green, and finally greenish yellow, wbile tbe acid itself becomes yellow. Rosin oil to any extent is also indicated hy adding to one part of the suepected oil in a smnll vial three parts of pure linseed oil. If tbe samplee contain a rosin oil, the pure linseed oil floats on the top and the line of contact is plainly visible.—*Leffell's Mechanical News.*

Bavarian Anti-Friction Composition.—Ten and one-balf parts of lard, melted with two parts pulverized plumbago. Melt the lard and mix in the plumbago slowly, and be sure tbat it ie fine. Stir well. Apply in cold etate. Used witb great success instead of oil, tallow, etc.

Paint and varnisb brushee ehould nevei be ueed as dustere, nor ueed dry. If, from any cause brusbee have ebrunk, they can generally be restored by putting them for a ehort time in n cellar or moderately damp place.

Brass caetings abrink one-eighth of an incb to a foot in cooling. Copper ehrinks one-fourth of an inch to u foot. Iron ehrinks one-tentb of an inoh to a foot.

Exhaust steam ebould not be discbarged into a brick cbimney, else tbe eteam will disintegrate tbe mortar and the chimney be injured.

Glue tbat will resist water, it ie said, may be produced by boiling one lb. of glue in two quarte of skimmed milk.

To clean grease from bolts, moieten them in benzine; roll in sawdust and brusb off.

Extracting Magnesia from Sea Water.—The *Moniteur Industriel* describee a new method for extracting magnesiu from sea water, whicb is an inexhaustible reservoir fer it. The magnesiu may be precipitated by chalk, the same as from other solutione. After allowing the preoipitate to settle one day, one cubic meter of sea water gives ubout 80 liters of geletinous magnesia. The procese could readily be carried out on u lnrge scale, making nu industry of it, by collectiag the precipitate in lurge hasins. The chalk would he the principal expense incurred. Heving thus obtained the magnosia, a calculated quantity of dilute phosphoric acid ie added, wbich will again precipitato a tribasic phospbate, whicb settles and whicb can be filtered on linen or hy a filter press, and becomes an excellent agent for extracting the ammonia from fertilizers consisting of ummoniamegnetic phospbates.

A Test of Pure Dye in Black Silks.—Dilnte muriatic acid will discbarge a pure blnck dye from the silk witbout injury to tbe fiber, leaving the silk a ligbt struw-yellow color. Weigbted eilks will suffer more or lese obange and breaking dowu of fiber by the same test, and if particularly bad will sink into shapeless gum. Care sbould be taken to obtain tbe proper degree of dilution, wbich, as the commercial acid iteelf variss in strength, can be uscertained best by trinl.

To Paint Tin Roofs.—Firet scrapo off the rosin and sweep tbe roof. Wash witb strong soda water, and let remain till rained on. Give it a coat of pure Venctian red mixed with one-tbird boiled and two-thirds raw linseed oil. The second coat may be of any color. The soda water dissolves tbe rosin nfter tbe scraping, and destroye the greasy nature of tbe solder and the new tin, so tbat the paint will take hold.

Specific Against Mice.—As a specific ugainst mice, calomel is recommended. One part of calomel, five parts of wheat flour, one part of sugar and one-tentb part of nltra-marine are mixed, and tbe whole exposed as powder in tbe localities infested.

A Good Glue and Mucilage.—Tbe best quality of mucilage is mede by dissolving clear glue in equal parts of water and etrong vinegar, and adding oue-fonrth of an eqnal volume of alcobol und a small quantity of a solution of alum in water

Cement.—To make a cement for boiler joints, take 10 parts of white lead ground in oil, tbree parts of black oxide of manganese and one part of litharge. Rednce to u proper consistency, and apply wbere needed.

Good Health.

Action of Jaborandi on the Hair.

Science, of Sapt. 17th, contains some furtber particulars in reference to the uction of jaborandi in changing buman bair to a darker hue, beyond those we gave in our last issue. Tbe active principle of the drug, whicb was employed, is known as pbilocarpin—an alcoloid, derived from the plant jaborandi, whicb bas been qnite recently introduced into medicine from Brezil. The philocarpin was administered by bypodermic injection. It bas a peculiar and powerful effect upon the buman system, producing profuse perspiration and salivation. It also stimulates the growtb of tbe hair. It was administered for the purpose of eliminating urea from the system of the patient, whicb was present as a consequence of tbe euppression of urine due to other troubles. About 40 centigrams were put in gradually increasing dozes, and producing 22 "sweats," and it was estimated that 14 pints of fluid were removed by these "sweats." The uresmic symptons were oomletely removed.

The administration of tbe philocarpin was commenced Dec. 16, 1880, and tbe cbange in the bair was first noticed Dec. 28tb. After that time tbe cbange was gradual. Tbe bair, in its normal state, was ligbt, tinged witb yellow. In Jan., 1881, it became a cbestnut brown, and in May following almost black. In addition to the chnnge of color, the bair also bscume thicker and coarser. While previously quite dry, it became moist and oily. The hair on all parts of the body underwent the same cbange. The eyes also bscame much darker—a dark blue.

Another case, tbat of a 14-monthe-old infent ie reported hy the eame party—Dr. D. W. Prentiee, of Waehington City—with the same resulte in caee of tbe hair. In tbis inetance the drng was administered for membraneous croup.

The effect of thie drug on the hair appeare to be eomething new, and if experience confirme tbeee observations, another will be added to tbe eeveral already-known marvelous influences wbich philocarpin hae npon tbe human eyatem. Tbe *modes operandi* of the change ie yet to be determined. It is known that the drug etimulatea tbe growth of the bair, and the auggeetion ie made that the change in color may be due to an oily pigment tbat is increaeed in quantity under tbe influeuces of large and continuoue doees. As age advancee tbe procesece of nutrition are enfeebled, and the bair gradually becomee thin and dry nnd white, until it finally diee and falle off. Poseibly this drug, if it can be administered without detriment to tbe general syetem, may beoome valuable as a preventive to premature baldness,

Brain and Body Work.

Pbysiologists, after pntient und close inquiry, bave arrived ut tbe important and practical oonclusion, tbat tbe power of the entire man, his vitality, is as much expended hy two bours of desp mental effort as by a whole day of ordinnry bodily labor. This fact seems to be founded on observed physiological laws; beuce, tbe man who spends four bours in the 24 in earnest mental labor, goes to tbe utmost allowable limit for a dny's work, and all the time that remains, after deducting 10 bonrs for enting, sleeping und dressing, sbould be conscientiously expended in muscular exercises, which require no brnin effort, and snch exercises should nlwaye, hy preference, be those whicb are ngreeable, useful and profitable; for tbey not only promoto the bealthful condition of tbe body, but give rest to the brain, whicb, by that rest, recuperntes its powers; many can remember, when turning back to their scbool duys, that tbsy have gone to bed fecling tbat they did not know their leesons, yet, on rising in tbe morning, tbe mind would run over them with a gratifying and surprising clearness. It is this whicb accounts for tbe observation that persons bave striven hard to remember some importent fect, or as to wbere valuable papers bave been laid, and towards morning, when tbe mind begen to awake, a little before tbe body, tbis being tbe time of dreams, the point is made clear in tbe form of a dream, tbus ebowing that rest of tbe brain, wbether by actual sleep or tbe passive, comperative rest which manual labor affords, gives mental activity, vigor, perspicacity; from these it follows that no form of muscular exercise is ignoble in a student, a brain-worker, wbicb has to be done hy some one, and hy being done hy him, wbat saves money, or will save tbe time of anotber, wbo, perbaps, may alresdy be overtaxed. How many servnnts are overtaxed! how many faithful, uncomplaining wives are overtaxed! end eons and daugbters sometimes; and clerks, and apprentices, nnd otber employees. In every dwelling in a large city, there are many tbings which tbe master could do whicb would reflect benefit on himself and otbers.

The Improvement of Human Health.

In result of a somewhat large acquaintance witb tbe facts beld to indicate tbe state and progress of "human bealtb," I feer my testimony must be given to show tbat tbe improvement effected by science consists in a prolongation of the passive endurance of life, rather tban an extension of tbe period of true vitality, or any increase of tbe opportunity for good work and real intellectual enjoyment. We may "live" longer, but our lives are not either bnppier or more useful for tbe excessive energy recently devoted to tbe conservation of health, or this inordinate and laborious means taken to avoid disease and death. It may, doubtless, be possible to raise bumanity to the level of one of tbose scientific toys which approximate perpetual motion, bnt expend their whole force in moving themselves. Wbetber longevity purchased at tbe price of passing a life-time in running away from death would be worth bnying, I must leave to be determiued by the judgment of those wbo set a value on our so-called sanitary progress, which I, for one, fail to recognize.

I think meu were happier and bettsr, und lived nobler livcs before the pursuit of bealth and the yearning for longevity became a craze, almost amounting to madness. What to eat, drink end avoid, wbat to wear, where and how to live, by wbat means to avoid infection, to keep off disease, nnd to escape death for a few weary and worried yesrs, are questions which so engross tbe tboughts, if tbey do not embitter the lives, of the multitude, that the proposition, "Is a sanitary life wortb living?" has come to be a subject of serious contemplation, and one wbich the taxed and barassed community will sooner or later be compelled to entertain.—*Dr. Granville, in a letter to the Spectator.*

To Cure Fits of Sneezing.—Surgeon Bradley says, in the *British Medical Journal*, that being tormented hy one of the most distressing symptoms of hay fever, incessant sneezing, aud having tried all remedies suggested, in sbeer desperation, he plugged his nostrils with raw cotton. The effect was instantaneous; sneezing cessed, and after repeatedly testing the remedy, he concludes that it is wortb knowing and recommending.

Singular Death.—A singular death occurred in Paris recently. A man etruck a match to ligbt it, and a bit of phospborus flew on his band, burning it eligbtly. The next day tbere was a white spot, whicb be covered with plaster. A pus veseel formed, which caused blood-poisoning, and the man died.

French Waterproofs.—Tbe method of making clotbing, paper, glovee, and other porous eubetancee water proof, as pursued under a patent in Paris, is as follows: Cut paraffine in small slices, and dissolve in pure naptha or benzine free from fat or oil. Make a solution in a vessel with a glase stopper, and ehake repeatedly until a thorough solution is msde, and there may be an excese of paraffine to bring about a good result. Immerse the articles till perfectly saturated. Dry by beat or in the sun. The solvent evaporatea and leavee tbe paraffine, whicb ie impervious to water and will reeiet acide. Iron olotbe, and a poliebed surfaca will be obtained.

Passing Events.

Probably the most interesting item of news for miners this week is that to the effect that the hydraulic miners are going to work again, and that Judge Keyser has been decided to be disqualified from trying the debris suits. We give the details of this matter in another column of this issue. The miners will soon, when the cause is tried, feel more assured of impartial judgment.

As to the miners going to work, the following dispatch from Nevada City, dated the 4th, explains that matter: The leading hydraulic mines in the county are rapidly completing their preparations to begin washing, and will all be in full operation, with white labor exclusively, before many days have elapsed. The hundreds of employees who have been idle ever since Judge Keyser's injunctions were served say, that while they are willing to obey any mandate of any court which seems to them reasonable, they cannot longer sit with their hands folded and see their families suffer for want of the necessaries of life, as has recently been the case in numerous instances, owing to the peculiar situation of affairs. The determination of the working miners, who assume the entire responsibility of the act, is endorsed by the citizens here.

There are already indications of "pulling up stakes" from the northern camps. Up at Wood River the prospectors are coming in and many are preparing to leave for the winter. The climate prevents much outside mining in winter either in Idaho or Montana. Salt Lake will no doubt be the wintering point for a good many miners this year.

Here in California we are having the most delightful weather of the year. The rains we have already had seem to have purified the atmosphere thoroughly.

Resuming Work on Gravel Mines.

Large gangs of miners—white men—have begun to work on the North Bloomfield hydraulic mine, the Milton at French Corral, the Manzanita at Sweetland, the Excelsior at Smartsville, and several others. When it is remembered that the mining companies owning these mines are all under injunction, this action on the part of the miners may surprise many persons, and especially in view of the fact that Sacramento, Yuba and Sutter counties are actively instituting suits against various companies for allowing debris to flow into the rivers. There are several reasons why the miners have resolved to disregard the injunction—for that is practically what it amounts to—and these reasons may be summed up about as follows:

In the region principally affected, some 1,400 miners have been thrown out of employment for some months, and during their busy season, by reason of the injunctions served against the mining companies. These are only actual miners, many times that number of persons being dependent on the work. These miners have gradually, being without work, been getting harder and harder up, until they have become almost desperate, and now say they will obey any reasonable injunctions, but will not let injunctions make them starve to death. Accordingly they are going to work.

Another thing, Judge Keyser, having been pronounced by the Supreme Court to be disqualified to try certain debris suits, was as much disqualified when he granted the injunctions as he is now. Therefore, any injunctions granted by him are null and void. Of course the matter will come before a new Judge, who may grant the injunctions, but they cannot be served, and will be of no effect.

The truth of the matter is, and it might as well be recognized first as last, the miners are *individually responsible* in this matter. They are doing this work themselves. The mining companies have practically dissolved. All the officers, presidents, secretaries, treasurers and superintendents have resigned. If new injunctions are granted against the companies, there will be no official of said company on whom to serve them.

The water belonging to these companies is running to waste. The ground is of no value unless the water can be used. The companies say to the men: "We do not want to see you starve; so if you want to go to work on that ground with that water on your own individual responsibility, do so. Make what you can out of it."

The miners have done this, and it is on this basis they have gone to work. If they are reached at all, they must be reached individually. Each individual must be brought before the courts and tried, and each must have his chance.

The miners argue that even if they are imprisoned they will be better off than without work. The county that imprisons them must support them. At Marysville they cannot find room to put 1,400 men in jail, and if that does come to pass, some good accommodations must be made for so many men, and good "grub" provided.

They argue that the decision disqualifying Judge Keyser practically renders null and void all his proceedings, and therefore raises the injunctions.

It may be remembered that the Eureka Lake company has been at work continuously all summer, although injunctions were granted against them. But the officers resigned and the injunctions could not be served or forced. The men argue that if the law could not reach the big company it cannot under similar circumstances reach them.

This is not, therefore, a corporation matter; it is individuals who are to be held accountable.

It is highly probable that this action will tend to a much more speedy termination of the whole debris matter than was probable under the ordinary tardy proceedings. It will bring the matter forcibly before the people. We have given in the above paragraph the facts of the case as it now stands, and must confess that these new phases make more of a muddle of the debris question than ever.

The Contention or Western Mining company, has brought suit against the Head Center company, A. T. The value set upon the piece of ground claimed is $500,000, and the plaintiff prays for judgment for the mine and $225,000 damages. A writ of injunction has been issued against the Head Center company, and the Western has entered upon the ground in dispute and put men at work sinking a shaft.

A New Departure.—A dispatch from London (Ont.) says: At the inquest on the five people killed by the collision on the Air Line Great Western railway, the jury returned a verdict of manslaughter against John Maxwell the conductor, and Richard Womsley, the engineer of the excursion train, they having disobeyed the orders of the company. Maxwel has fled the country and Womsley was killed.

A Los Angeles paper says: The Santa Rosa Mill & Mining company, of Silverado, has concluded to abandon the mine, upon which a large amount of money has been expended without satisfactory results.

Disqualification of Judge Keyser in the Debris Cases.

The city of Marysville, in September, 1879, commenced an action in the then District Court of Yuba county, over which the Hon. Philip W. Keyser presided, against the North Bloomfield Gravel mining company and numerous other mining corporations and individuals, to enjoin them perpetually from depositing tailings and debris from their respective mining claims in the channel of the Yuba river or its tributaries, or from otherwise polluting the water. The Bloomfield company and other co-defendants filed demurrers and moved for a change of venue, basing the motion on the ground, among others, that Judge Keyser was directly interested in the result. In support of the motion the defendants submitted affidavits which set out substantially the same allegations as are made the ground for the petition in the Supreme Court. Judge Keyser being of the opinion that he was not disqualified from sitting in the cause, denied the motion on the 21st of May of the present year, the Superior Court having in the mean time come into existence. Certain of the defendants thereupon applied for a writ of prohibition to prevent Judge Keyser from acting in the cause, the claim to the writ being based on averments that he owned two lots in Yuba City, Sutter county, and bordering on the Feather river; that they are opposite the land described in the complaint in the action of the city of Marysville, and that all the remedy afforded Marysville will by that action avail him in reference to his lands to the extent and in the precise manner as if he had joined with the city as plaintiff, or had instituted a separate action.

The Supreme Court has now rendered a decision to the effect that Judge Keyser *is* disqualified to act.

The opinion proceeds to say that it is an ancient maxim, and one founded in the most obvious principles of natural right, that no man ought to be a judge in his own cause. That principle finds expression in our statute in these words: "No justice, judge or justice of the peace shall sit or act in any proceeding: 1st, to which he is a party or in which he is interested." This provision should not receive a technical or strict construction, but rather one that is broad and liberal. Undoubtedly, the prohibition does not extend to cases where the interest is simply in some question or questions of law involved in the controversy, or when it is indirect and remote; and if the interest of Judge Keyser in the suit pending before him extends no further than that, it is clear that he is not disqualified to determine the case. But we cannot so regard his interest upon the facts as presented. The City of Marysville says in its complaint that the defendants are causing the property of the city and that of its inhabitants great and irreparable damage by sending down the Yuba river vast quantities of tailings from their mines, thus polluting the waters of the river, filling up its channel, overflowing the adjacent lands, and depositing the debris on the lands of the city and otherwise injuring it and its people. The defendants say in their petition that the respondent owns land adjoining those of the city and similarly situated. If the relief prayed for is awarded, the same judgment that

Stops the Flow of Tailings and Debris

On the lands of the city of Marysville, stops its flow onto the lands of the respondent. The very judgment that protects Marysville will protect him. His interest, therefore, is not merely in the questions of law involved in the controversy, nor is it uncertain or remote, but it is a direct and immediate interest in the result of the action. We are therefore of the opinion that respondent is disqualified to sit in judgment in the cause. Two objections were made to the remedy sought. The first was, that the writ cannot go to the respondent as Judge of the Superior Court; the second, that the petitioner has a plain, speedy and adequate remedy by appeal. Section 1102, Code of Procedure, provides: "The writ of prohibition is the counterpart of the writ of mandate. It arrests the proceedings of any tribunal, corporation, board or person, where such proceedings are without or in excess of the jurisdiction of such tribunal, corporation, board or person." Section 1103 provides that it may be issued by any court, except Police or Justices' Courts, to an inferior tribunal, or to a corporation, board,

Or Person,

In all cases where there is not a plain, speedy and adequate remedy by the ordinary course of law. We are unable to see why such Judge is not a "person" within the letter and spirit of the statute, against whom the writ may go in a proper case. The other objection to the issuance of the writ is, that the petioner may have the action of the Judge of the court below reviewed on appeal. Unlike certiorari, the statute does not make the existence of a right of appeal an answer to an application for a writ of prohibition or of mandamus. Under the circumstances, we are of the opinion that the petitioner has not a plain, speedy and adequate remedy in the ordinary course of law. It is hardly necessary to say that the merits of the controversy between the City of Marysville and the miners, are in nowise involved in the present proceedings. Let the demurrer to the petition be overruled, with leave to respondent to answer within 10 days from the entry of the order.

Justice Sharpstein concurs in the judgment, basing his decision solely upon the facts alleged in the petition and not denied.

Justice Myrick, in another concurring opinion, wished "to be distinctly understood as not expressing directly or indirectly the view that this will effect the injunction issued by the court below, or the order granting the same." His concurrence extended to prohibiting Judge Keyser from sitting further in the case if no answer shall be made denying his alleged disqualification.

Justices Thornton and McKee dissent, holding that the writ of prohibition is not the proper remedy, as it does not run to a judicial officer to prevent him from proceeding to hear and decide a cause when the jurisdiction belongs not to him as a person, but to the court of which he is a constituent part.

Miners' Rights from the General Government.

The doctrine of priority of occupation, ownership and rights, in the vexed debris question, is stoutly maintained by the miners. This view of the subject is well summed up in the defendant's answer of the People *vs.* the Gold Run Ditch and Mining Co. The paragraph relating to this branch of the subject is as follows:

That said mineral lands owned by defendant have been owned and in the notorious possession of defendant and its predecessors for the past 25 years or more, and so worked with the knowledge, consent and approval of the State and General Government; that the State of California had full knowledge of such use, and that the owners of mines, including defendant, claimed the right so to use the channels of the ravines, gulches and canyons by virtue of said license and of local customs, by decision of the Courts of the State and of the laws of the State and the United States; that said license was never revoked by the United States, but was confirmed by its issuance of patents for said mineral lands, and for which a higher price was charged because of their being mineral lands and for mining purposes, than was charged for agricultural land; that the patents for defendant's land were issued in 1873, 1875 and 1881, but the mines have been held and operated by defendant and its grantors for upwards of 25 years, with the knowledge and consent of the Government and of the plaintiff herein; and that its title to said lands relates back to the time the mines were first located; and that it was intended by the Government, by issuing its letters patent for said mineral lands, to confer, and that it did confer upon defendant the right to discharge refuse earth and tailings into the nearest ravine, and that the State of California has by its legislature and courts at all times confirmed such right.

Defendant avers that it is the owner of certain valuable water rights and ditches, which are valueless except for working said mines; that defendant purchased said water rights, ditches and mines in 1870, paying therefor $130,000; that defendant's predecessors in interest located and acquired said water rights in 1856, and thereby appropriated the same for said use, and constructed over 25 miles of ditches and aqueducts to conduct the water to said mines, at a cost of over $50,000, and has expended $100,000 in enlarging and improving said property, and also a further sum of $200,000 in developing its mines.

Defendant further avers that the custom has been universal in the mining districts of the State since 1848 to dump and discharge the water and tailings from mines into the nearest natural ravines and water courses.

Proceedings Against Miners.

The Sacramento Board of Supervisors this week adopted a resolution instructing the special legal counsel for the county to institute and take the necessary steps to enjoin and restrain the Amador and Sacramento county canal company from using the bed of Cosumnes river as a place for the deposits of its tailing or mining debris.

The Board of Supervisors of Yuba county on Wednesday passed the following resolution by a vote of four to one:

Resolved, That B. W. Howser, the District Attorney of Yuba county, be and hereby is authorized and is instructed to commence legal proceedings against all persons that are emptying or distributing debris into the Yuba river or any of its tributaries by hydraulic mining. Said proceedings are to be begun and prosecuted on the part and in behalf of the county of Yuba, provided that the Anti-Debris Association, or any other association, provide counsel to assist the District Attorney to prosecute said suits at their own expense, and at no expense to the county for assistant counsel.

After the passage of this resolution, notice was given of a motion for reconsideration. The majority of the Board, however, are decidedly in favor of the resolution, and it will no doubt be adhered to.

District Attorney Howser has advised the Board of Supervisors of Yuba county that the Board has a legal right to bring suits in the name of the county against the hydraulic mining companies operating on the Yuba river or its tributaries. No action has yet been taken.

Mineral King and Mt. Whitney.

[Written for the PRESS by J. W. A. W.]

My last letter to the PRESS was from Granger's ranch, on the road from Visalia to Mineral King, 13 miles west of the latter, and at an elevation above sea level of some 4,500 ft. This is written in Camp Whitney at an altitude of about 11,600 ft., on the true Whitney creek, which flows in a southwesterly direction through the grand granite-walled canyon that forms the readiest ascent to our highest mountain, indeed, the only ascent accessible at present for pack animals.

In the Mineral King mining district, we found nothing of special interest to record, but shall stay there longer on returning, and shall tell your readers everything reliable that we can learn about it.

Suffice it to state here, that Mr. Tom Fowler is pushing his work in the Empire mine, and seems as sanguine as ever of its future value. Also, we found the altitude of the flat where the town is, to be approximately 7,750 ft., and the total snowfall there last winter was about 27 ft., corresponding to 32.40 inches of rain against 35 ft. the winter before, or 42 inches of rain. This difference is to be accounted for chiefly by the heavy and uncommon snow storms of April, 1880.

Friday, August 26th, we left Mineral King, with three saddle and two pack animals, and coming by a very circuitous and rugged trail some 81 miles, reached this camp Saturday, Sept. 3d. We came slowly, spending considerable time fishing, hunting, exploring and taking notes. Seven miles beyond Mineral King, we found Mr. Wales awaiting us. Of mountain trout, including the celebrated golden trout of some of the smaller tributaries of Kern river, we caught in all, till we reached these higher streams where there are no fish, 222. Certainly no more delicious fish than these are to be found anywhere. Of those caught, the sizes ranged from 4 inches in length to over 17 inches, the latter weighing 2 lbs. For a week we feasted to satiety on these finny delicacies. The peculiar features of these

Golden Trout.

On each side they have a golden or orange-colored stripe from one-eighth to one-quarter inch wide, extending from gills to anus, a similar one one-half inch and more on their white belly, and from 8 to 11 dark brown blotches about one-quarter inch wide and the same distance a part upon the lateral golden stripe. Their vitality is something wonderful. Often, for 5 to 10 minutes after cleaning and their heads off, they would at intervals double up, turn over with a jerk, and even jump out of a shallow pan. One that was split and spread open to its backbone, moved at intervals as if trying to breath, for fully 5 minutes. Sunday and Monday, Aug. 28th and 29th, we spent on Fish lake, sometimes confusingly called Kern lake. Here, on Monday, were caught our largest fish, all marked like the golden trout, only the orange stripes were less brilliant than on those caught in the smaller streams. Even the 2-lb. trout had the yellow stripes and dark blotches, though fainter.

There is a larger and smaller

Fish Lake,

The larger about half a mile higher up the main Kern than the smaller one. The smaller has long existed, but the larger was formed by the heavy storms of '67 and '68, which chocked the mouth of a deep canyon with rocky debris. The surface of the larger is from 100 to 150 acres, the smaller about 50 acres. Each is from a few feet to 20 ft. deep. Both are gradually filling up with sand. The altitude of this lake is about 6,600 ft. But as this letter, written under the unfavorable circumstances of mountain travel, must be short, I must omit full details, hoping to give them in future, and must here sum up a few facts.

The Only Soda Springs

Met with on our route are the four noted ones of Mineral King described in my letters of last summer; temperature 45° to 48° F.; one on Little Kern, two miles below Edwards' ranch or Bullion flat, that is, nine miles from Mineral King; temperature of water 49°; altitude about 8,900 ft. and the last at Runklee or Soda Springs ranch, one mile up the main Kern from Fish lake; temperature of its water, 50°. All these springs are strongly impregnated with carbonic acid gas, and have a reddish sediment, like all chalybeate springs. In Farewell gap, four miles southeast of Mineral King, we had the good fortune to find some genuine

Red or Crimson Snow.

We melted some and have saved the water for scientific examination. Though we have seen much snow at several points since, we have found, as yet, no no more of this curious and interesting product of nature. We may find more on the vast snow fields of the lofty and unmeasured Kaweah peaks.

Our camps have varied in altitude from 6,500 to 11,400 ft.; the various passes on our trail from 9,600 to 12,000 ft. We have seen but few deer, and no bears.

Signal Service Camp.

Two miles above us, and some 3,000 ft. below the summit of Mt. Whitney, is the camp of Prof. S. P. Langley and Capt. O. E. Michaelis, with their assistants in the important work of establishing a signal station of the U. S. Army on the summit of Mt. Whitney. Capt. Michaelis commands the expedition, and Prof. Langley is consulting specialist of the expedition. In their lower camp they have seven tents, and their most complicated and valuable instruments. On the summit, one tent is pitched, and there careful observations have been made for four days past with mercurial barometer, thermometers and part of their apparatus intended to determine more accurately the real color and heat of the sun. Having completed most of the observations for which they came, this party of 12 or 15 in all will leave for their return East about the 10th inst. Prof. Langley informs me that results so far have been quite satisfactory. So much can be said about this interesting and valuable excursion, that it must be left for future record. The camp on the summit, where Capt. Michaelis raised the stars and stripes for the first time August 16th, and officially established the signal station, as per orders of the Secretary of War, is called

Camp Frank Thomson,

in honor of a Philadelphian of that name, who has partly equipped the expedition. Our party, consisting of W. B. Wallace, Rev. Fred. H. Wales and your correspondent, ascended Mt. Whitney Monday, September 5th, as did Prof. Langley, Capt. Michaelis and one or two others. Through the kindness of Capt. Michaelis, Mr. Wallace and I enjoyed the rare and unexpected novelty of spending

A Night on Mt. Whitney.

Fuller details of this, we must also leave for the future. We saw a sunset and sunrise from the summit, to perfection.

The panorama of surrounding mountains, valleys, lakes, canyons, precipices, and snow masses presented from that giddy hight is perfectly superb—almost bewildering. There is no end to its grandeur, its beauty, its weirdness. Then a moonlight scene on Mt. Whitney! Mountains and valleys and lakes made visible by the bright moonbeams, so bright in this pure transparent atmosphere. Men of the expedition have spent only four nights on the summit. Mr. Wallace and I were the 8th and 9th persons who have slept there, and we enjoyed the oddness of the situation so much that we slept only three or four hours after midnight. Then think on moon and star studies from Whitney's highest point! The coldest hour Monday night was 25° Fahr., though Saturday night, Sept. 3d, the northeast wind raged so that the mercury fell to 14°. That night ice froze solid in buckets and pans. Tuesday morning ice was only frozen from half to three-quarters of an inch.

Complete reductions of observations for the

Altitude of Whitney

Have not been made, but it is not likely to vary much from results of former observations, that is 15,000 ft., or possibly a little less. The officers in charge think there is no doubt of its being our highest mountain except Mt. St. Elias, in Alaska. I must mention, in brief, that the mountain now known and measured as Whitney is what has been called

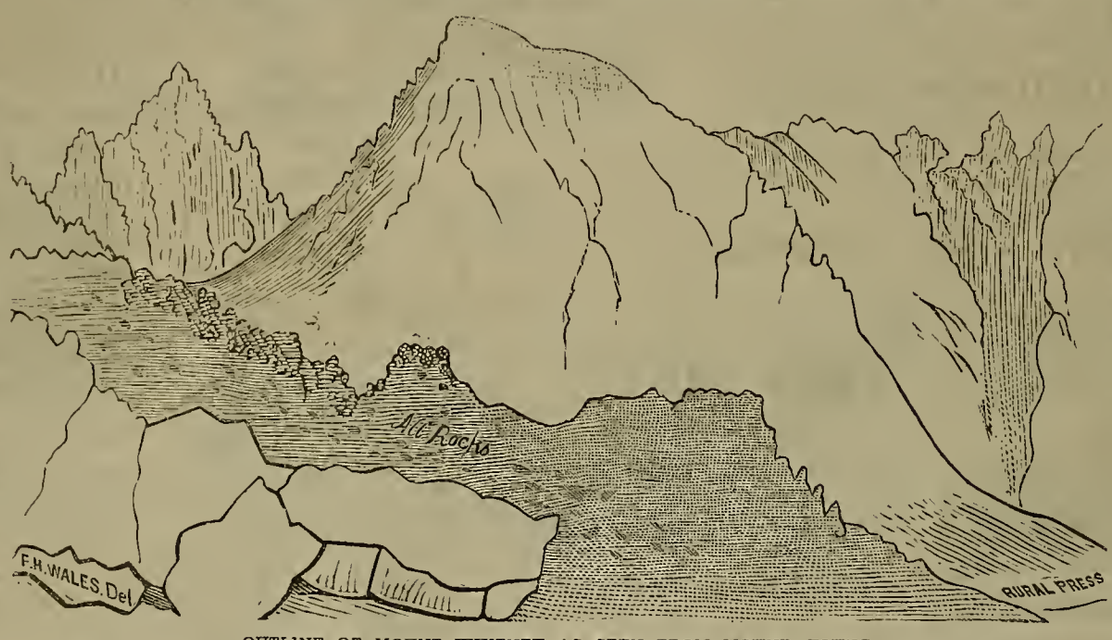
Fisherman's Peak.

But more of this in future letters. Its Indian name, as I learn from Wm. Crespo, mining and civil engineer of Cerro Gordo, Inyo county, is Too-man-i-goo-yah, meaning the very old man. Their superstition is that their guardian spirit resides there, and they naturally look toward it with great veneration.

A Stone House on Top

And a trail 15 miles long toward Lone Pine—10 miles farther by road, but only 19 in a direct line, and 45 by present pack trail—are a necessity for the valuable work of our Signal Corps on this mountain. Officers in charge deem $10,000 enough to do this work. Let Congress be urged to make this appropriation next winter, that the Signal Station of Mt. Whitney may be fully established next summer, and observations made there the year round, as can be done with such inexpensive improvements.

Mt. Whitney, Sept. 7th.



OUTLINE OF MOUNT WHITNEY AS SEEN FROM MOUNT YOUNG.

Copper in Arizona.

The Globe District Mines.

[Written for the PRESS by "INSPECTOR."]

I have been visiting some of the mining districts of Arizona, and among them Globe and Mineral Creek, which not being so frequently visited as Tombstone or Harshaw by reason of their distance from the railway, may possess some interest to the general reader.

In the first place the aspect of the country is more grateful to the traveler's eye than the region I have seen lying south of the Gila river.

Globe and Mineral Creek districts are in Gila county, which was taken from Pinal county last year, and Globe City is the county seat. Only the late maps show the division of counties, but Globe City will indicate the location with sufficient accuracy.

The range of mountains known as the

Pinal Range

Separate Globe and Mineral Creek districts, and also divide Globe from Pinal county on the west. These mountains are not only a pleasing feature of the landscape, but they are invaluable to the settlers there by reason of the fine growth of timber which clothes the loftier peaks, which supplies the people with fuel, the builder with boards and joists, the miner with timber and the smelter with charcoal. There are advantages which any practical man familiar with the poverty of southern Arizona in the way of forests will readily appreciate. By way of illustration I will say that the Copper Queen mines in Cachise county bring their coke from San Francisco at a cost of over $50 per ton, while charcoal can be had at Globe for $20 per ton.

Timbering a mine, erecting mills, houses, etc., are items of expense so material as to make the cost of lumber of serious consequence. As Globe City is 125 miles from the railroad by stage road the cost of transportation is an important matter, especially for such bulky articles as coke and lumber. There are two sawmills in the mountains which are kept busy in supplying Globe and vicinity, and others are to be started.

The Lands Along Salt River
